A Priori

"A priori" **is a term used to identify a type of knowledge which is obtained independently of experience. A proposition is known *a priori* if when judged true or false one does not refer to experience. "*A priorism*" is a philosophical position maintaining that our minds gain knowledge independently of experience through innate ideas or mental faculties. The term *a priori* is distinguished from *a posteriori*, which means knowledge gained through the senses and experience. These are the two most common ways in which philosophers argue that humans acquire knowledge.**

For Aristotle, "a priori" referred to something which was prior to something else. By "prior" he meant that some thing's existence was caused by the existence of another. Aristotle argued that to have knowledge of a prior thing, then, was to have knowledge of a causal relationship. He argued that we can establish a causal relationship between things through syllogistic logic. Descartes used the term "a priori" in his quest for the foundation of all knowledge. For Descartes, knowledge of our own existence was a priori because (a) denying it leads to a contradiction, and (b) we do not need to rely on our experiences to ponder our existence.

Kant believed that *a priori* truths could be found in the two areas; mathematics and the categories which organize the material of experience and science. Kant divided *a priori* truths into two categories: the synthetic and the analytic. Traditionally, mathematical propositions were seen as both analytic and a priori. Kant, however, classifies both mathematics and the categories as synthetic a priori. Math is synthetic *a priori* because it depends on the pure intuitions of the elements of time and space. Kant argued time and space were central intuitions to mathematical knowledge, and were thus the reasons for his grouping mathematical truths in the synthetic a priori. Our categories are identified as synthetic *a priori* because denying them does not lead to a contradiction. On the other hand, these categories are central to experience. Kant used the example of causality, in the "Second Analogy" of the *Critique of Pure Reason*, to demonstrate that the concept of an "event" having a "cause" must be connected before we can give apply either notion. This connection can only be a synthetic one, since it is not tautological.

Abortion

MAIN ETHICAL ISSUES. The applied ethical issue of abortion involves a consideration of the reasons for or against terminating the life of a fetus. Much has been written on the issue of abortion both in the popular press and in the philosophical literature. The debate focuses on two distinct issues: (1) whether a human fetus has a right to life, and, if so, (2) whether the rights of the mother ever override the fetus's right. Often the issues are discussed independently of each other. Discussion of the first issue, regarding a fetus's right to life, usually draws on the concept of moral personhood. A being is a morally significant person when it is a rights holder, and we are under moral obligation to that being. For example, I am a morally significant person and am entitled to the right to life, which others have a moral duty to acknowledge. The problem for moral theorists is to establish a criterion that explains why I am a morally significant person, and a fly or a worm is not a morally significant person.

Some religious philosophers suggest that we are morally significant persons at the moment of conception. Nonreligious criteria include, when we first take the human form (in the fourth month of pregnancy), when our organs become differentiated, and when the fetus can survive outside the womb (both around the seventh month of pregnancy). Some philosophers suggest more general criteria such as when a being is self-aware or rational. These criteria are not exhibited until an infant is one or two years old. The criterion of personhood selected has decisive implications on the morality of abortion. If personhood is conferred on a being at the moment of conception, then, all things considered, aborting a fetus is immoral. On the other hand, if we select a criterion such as self-awareness, then, all things considered, aborting a fetus is not immoral. The challenge is in providing reasons in support of one criterion over another.

But even if we all could agree on a criterion of personhood, such as the moment of conception, the abortion debate would not be over. For, questions arise about whether the mother's right of self-determination overrides the rights of the fetus. It is the mother's body that is affected by the pregnancy, and it is her emotional and social life that will be drastically altered for at least the next nine months and beyond. These factors carry at least some weight. Other potentially overriding factors complicate the rights of the fetus, such as whether the pregnancy resulted from rape, or contraception failure. Arguments are required from both camps to establish the relative weight of these factors.

Historically, attitudes about abortion and the moral status of a fetus have fluctuated. Aristotle endorses abortion when writing that "when couples have children in excess, let abortion be procured before sense and life have begun; what may or may not be lawfully done in these cases depends on the question of life and sensation" (*Politics*, 7:16). The Hippocratic Oath states "Nor will I give a woman a pessary to procure abortion." The Jewish Talmud, compiled around 600 CE, holds that "an embryo is a limb of its mother" [Hulin 58a] and for the first forty days after conception, the embryo is "simply water" [Yevamot 69b]. A fetus's life is of equal importance to

that of the mother's only "once its head has emerged (from her body)"[Mishna Oholot 7:6].

Medieval theologians address the question of the moral status of a fetus by examining whether the fetus has a human soul. Aquinas held that the fetus only gradually acquires a human soul, and in the early stages of pregnancy is not technically human. The basis for Aquinas's view is a position called *hylomorphism*, that is, that the human soul can only exist in a distinctly human body. For example, a wooden chair cannot have a human soul. God, then, does not implant the human soul in a fetus until it that fetus takes a distinctly human form. Aquinas believed that this happened at about 40 days for males and 80 days for females. Scholars speculate that the difference was based on the point at which male and female sex organs could be observed in miscarriages. The implication is that one does not kill a human by aborting a fetus prior to the point at which it obtains a soul. In the selection below, Aquinas describes the process by which a fetus acquires a distinctly human soul. Following Aristotle's tripartite division of the soul, Aquinas argues that the fetus first has only the vegetative soul, which allows it to take in nutrition. For Aquinas, the fetus gets this directly from the father's semen, which follows the natural mechanism by which life produces more life. Next, the fetus develops a sensitive soul, which allows it to have sensations. Finally, though a special act of creation, God implants the intellectual soul in the fetus, which supercedes and perfects the previous two souls. The intellectual soul is what makes the fetus human.

During the Renaissance and modern period of philosophy, philosophers did not discuss the topic of abortion in detail. However, in his Essay Concerning Human Understanding (1690), John Locke implies that it "is part of the worship of God, not to kill another man; not to know more women than one; not to procure abortion; not to expose their children; not" (*Essay*, 1:2:19).

MARQUIS'S CRITIQUE OF ABORTION. In one of the most influential contemporary critiques of abortion,"Why Abortion is Immoral" (1989), University of Kansas philosophy professor Don Marquis argues that killing in general is wrong because it deprives an individual of a future which contains value. Most abortions, therefore, are fundamentally immoral since they deprive fetuses of a future containing value. Marquis addresses only the first of the above two issues, and concludes that a human fetus has a right to life at the moment of conception. Marquis begins by noting the pitfalls of both the traditional pro-life and pro-choice arguments on this issue. Pro-life arguments begin noting facts, such as the fact that fetuses look like babies and already have their complete genetic codes. As supportive arguments they note that it is wrong in principle to kill a human being. The problem, Marquis argues, is that it is not clear that a fetus qualifies as a human *being* (as opposed to a mere human growth, such as a cluster of cancer cells). By contrast, typical pro-choice arguments begin with facts, such as the fact that fetuses are not rational or social creatures. As supportive arguments they note that, in principle, it is wrong to kill only rational and morally significant persons. The problem here, Marquis argues, is that infants are also nonrational, thus, in principle, killing infants would be permissible on this view. Both pro-life and pro-choice arguments flounder since they appeal to biological and psychological criteria of moral personhood. Marquis attempts to bypass this problem by isolating the specific criterion which makes all killing wrong.

In general, killing is wrong because it deprives a being of its future. For example, I recognize that Jones will have a future similar to my own, containing experiences of great value. To deprive Jones of this is immoral. Marquis believes that the success of his theory hinges on whether his account of wrongful killing fits our intuitions, and whether it is superior to rival accounts of wrongful killing. In support of his criterion, he argues that killing generally is believed to be among the worst crimes

since it deprives the victim of more than perhaps any other crime. Also, people dying of AIDS or cancer report that their main tragedy is being deprived of a future. He notes four points as further evidence that his criterion is consistent with our intuitions. First, unlike many pro-life criteria, his criterion applies not only to human life, but to theoretically possible extra-terrestrial life as well. Second, in keeping with the intuitions of some animal rights advocates, his criterion may apply to higher animals. Third, in keeping with the intuitions of defenders of mercy-killing, his criterion does not rule out euthanasia. Finally, unlike many pro-choice criteria, his criterion makes infanticide wrong. Having established his general criterion of wrongful killing, Marquis concludes that abortion is clearly wrong since it deprives a fetus of a value-filled future (which would be a future similar to our own). He cautions that his argument establishes only the *prima facie* wrongness of abortion, thereby allowing that there may be overriding circumstances.

Marquis again notes that his criterion of wrongful killing will succeed only if rival criteria fail. Turning to the rival criteria, he begins by criticizing a view he calls the *desire account*: killing is wrong since it deprives us of our desire to live. For Marquis, this criterion fails since it implies that it is permissible to kill people who lost their desire to live. Also, this criteria fails to recognize that the goodness of life rests in our valuable experiences, not in the desire itself. He also finds problems with a view he calls the *discontinuation account*: killing is wrong since it discontinues the experiences of the victim. This criterion fails, though, since if Jones's life right now is bad (although his future will be good), then killing Jones right now would be permissible.

Critics of Marquis might argue that it is not enough for the fetus to merely have a value-filled future. It must have an *interest* in its future before it can have a right to it. For example, some might argue that the fetus must be able to *value* its future. Marquis responds that this condition fails since it would make it permissible to kill someone in despair who no longer valued her life. Michael Tooley has suggested that a being must have the capacity to *care about* its continued existence. Marquis argues that, even when we are unconscious and unable to care about *anything*, we still retain certain rights. Finally, Marquis addresses a possible counter-example which the issue of contraception might pose to his criterion. For, if killing is wrong because it deprives a future, then contraception would also be wrong since it deprives a future. This counter example fails, though, since it would be arbitrary to select a single victim from among an egg and millions of sperm.

THOMSON'S DEFENSE OF ABORTION. In "A Defense of Abortion," Massachusetts Institute of Technology philosophy professor Judith Jarvis Thomson argues that, even if we grant that fetuses have a fundamental right to life, in many cases the rights of the mother override the rights of a fetus. Accordingly, abortions are permissible in cases of rape, life-threatening pregnancies, and contraception failure. For the sake of argument, Thomson grants the initial contention made by Marquis and others that the fetus has a right to life at the moment of conception, even though she does not personally believe that a fetus has rights. She comments that, for critics this is all that is needed to establish the immorality of abortion. However, Thomson explains, it is not self-evident that the fetus's right to life will always outweigh the mother's right to self-determination. She makes her point with the following illustration. Imagine that you wake up one morning and find that you have been kidnapped, taken to a hospital, and a famous violist has been attached to your circulatory system. You are told that the violinist was ill and, in an emergency decision, you were selected to be the host because only you had the compatible blood-type. The violinist will recover in nine months, but will die if disconnected from you before then. Clearly, Thomson argues, you are not morally required to continue being the host. This, she believes, parallels the situation of

pregnancy by rape, and situations where the mother has to spend nine months in bed.

Thomson next examines an extreme anti-abortion view which maintains that abortion is impermissible even to save the mother's life. The rationale behind this view is that the child is innocent, and killing the child would be active; on the other hand, letting the mother die would be passive. Thomson criticizes that additional premises are needed to get to the conclusion that killing the child is murder; but when formulated, such premises are not universally acceptable. For example, it is an overstatement to say that directly killing an innocent person is always and absolutely impermissible. She concludes that abortion is justified if the mother's life is in danger. She then criticizes a modified extreme view: abortion is permissible to save the mother's life, but a third party cannot perform the abortion, since the third party must be impartial. Thomson criticizes that impartiality here is an illusion since the mother *owns* her body, and thus has first rights; a particular bystander may not feel justified in intervening, but some authority will be justified in performing the abortion.

Thomson continues by examining the notion of the right to life, and what it implies. Some have suggested that the right to life is the right to be given the bare minimum of what one needs for continued existence. She replies that if I need "the touch of Henry Fonda's cool hand on my fevered brow" to survive, I have no right to that. Some have also suggested that the right to life means that one has the right not to be killed. This is inadequate, though, since frequently dilemmas arise when one innocent life must be selected over another. Finally, she suggests that the right to life means that one has the right not to be killed *unjustly*. Thus, if abortion is wrong, it needs to be shown that it is unjust killing. In cases of rape and where the mother's life is in danger, this cannot be shown.

Regarding abortion in non-life threatening and non-rape cases, the critic argues that when a woman voluntarily has sex, and accidentally gets pregnant, she is partially responsible; and this partial responsibility gives the fetus a right to her body. Thomson replies that if reasonable contraception precautions are taken, then the woman does not give the fetus a right to her body. Thus, abortion will be wrong only in those cases where pregnancy is intentional.

Returning to rape cases, Thomson notes that the fetus's right to life would not be any stronger if the pregnancy lasted only one hour. Although the mother would be callous for not bringing the pregnancy to term, she would still be in her rights. She concludes by noting the unfair demands that society places on women by making them bring unintentional pregnancies to term. In no other area of social conduct are people required to be such good Samaritans. It will not help the critic to argue that the mother has a special responsibility which issues from her role as a mother. For Thomson, a person does not have a special responsibility unless it has been assumed by that person.

The Academy

Philosophical institution founded by Plato, which advocated skepticism in succeeding generations.

The Academy (*Academia* was originally a public garden or grove in the suburbs of Athens, about six stadia from the city, named from Academus or Hecademus, who left it to the citizens for gymnastics (Paus. i. 29). It was surrounded with a wall by Hipparchus, adorned with statues, temples, and sepulchres of illustrious men; planted with olive and plane trees, and watered by the Cephisus. The olive-trees, according to Athenian fables, were reared from layers taken from the sacred olive in the Erechtheum, and afforded the oil given as a prize to victors at the Panathenean festival. The Academy suffered severely during the siege of Athens by Sylla, many trees being cut down to supply timber for machines of war.Few retreats could be more favorable to philosophy and the Muses. Within this enclosure Plato possessed, as part of his patrimony, a small garden, in which he opened a school for the reception of those inclined to attend his instructions. Hence arose the Academic sect, and hence the term Academy has descended to our times. The name *Academia* is frequently used in philosophical writings, especially in Cicero, as indicative of the Academic sect.

Sextus Empiricus enumerates five divisions of the followers of Plato. He makes Plato founder of the first Academy, Aresilaus of the second, Carneades of the third, Philo and Charmides of the fourth, Antiochus of the fifth. Cicero recognizes only two Academies, the Old and the New, and makes the latter commence as above with Arcesilaus. In enumerating those of the old Academy, he begins, not with Plato, but Democritus, and gives them in the following order: Democritus, Anaxagoras, Empedocles, Parmenides, Xenophanes, Socrates, Plato, Speusippus, Xenocrates, Polemo, Crates, and Crantor. In the New, or Younger, he mentions Arcesilaus, Lacydes, Evander, Hegesinus, Carneades, Clitomachus, and Philo (*Acad. Quaest.* iv. 5). If we follow the distinction laid down by Diogenes, and alluded to above, the Old Academy will consist of those followers of Plato who taught the doctrine of their master without mixture or corruption; the Middle will embrace those who, by certain innovations in the manner of philosophizing, in some measure receded from the Platonic system without entirely deserting it; while the New will begin with those who relinquished the more questionable tenets of Arcesilaus, and restored, in come measure, the declining reputation of the Platonic school.

Views of the New Academy. The New Academy begins with Carnades (i.e. the Third Academy for Diogenes) and was largely skeptical in its teachings. They denied the possibility of aiming at absolute truth or at any certain criterion of truth. Carneades argued that if there were any such criterion it must exist in reason or sensation or conception; but as reason depends on conception and this in turn on sensation, and as we have no means of deciding whether our sensations really correspond to the objects that produce them, the basis of all knowledge is always uncertain. Hence, all that we can attain to is a high degree of probability, which we must accept as the nearest possible approximation to the truth. The New Academy teaching represents the spirit

of an age when religion was decaying, and philosophy itself, losing its earnest and serious spirit, was becoming merely a vehicle for rhetoric and dialectical ingenuity. Cicero's speculative philosophy was in the main in accord with the teachings of Carneades, looking rather to the probable (*illud probabile*) than to certain truth (see his *Academica*).

Active Powers

In 18th and 19th century Scottish common sense philosophy, the term "active powers" refers to the capacities of impulse and desire which lead to or determine human action. It is distinguished from intellectual powers which involve the capacities of reasoning, judging and conceiving.

The distinction is derived from Aristotle's analysis of the capacities or powers of living beings into nutrition, appetite, perception, movement, and reason. Of these, reason is held to be peculiar to humans. However, in humans, appetite (including desire, sensuous impulse, and will) partakes of reason in the sense of being able to obey it. For Aristotle, the distinction between moral and intellectual virtues rests on the distinction between appetitive and purely rational functions of humans. Aristotle's fivefold distinction of powers was adopted by Aquinas, but he discussed in detail only the intellectual and appetitive powers - the latter including desire and will.

Thomas Reid gave currency to this dual division in the late 18th century, especially in his two books *Essays on the Intellectual Powers of Man* (1785) and *Essays on the Active Powers of Man*(1788). Under the heading of "active powers" Reid further distinguished the will from principles of action, the latter of which included (1) mechanical principles of instinct and habit, (2) animal principles such as appetite and desire, (3) and rational principles such as duty and rectitude.

Aenesidemus (1st Cn. CE.)

Aenesidemus was a philosopher of the school of skepticism. He was born at Gnossus in Crete, but lived at Alexandria and flourished shortly after Cicero. Aenesidemus revived the skepticism which had been silenced in the Academy, with the view of making it assist in re-introducing the doctrines of Heraclitus. For, in order to show that everything has its contrary, we must first prove that opposite appearances are presented in one and the same thing to each individual. To strengthen the cause of skepticism, he pushed its limits and defended the ten tropes or modes of skepticism -- techniques or arguments to show that judgment must be withheld on any issue. Although Diogenes Laertius attributes the ten modes to Pyrrho, it is likely that they owe their existence to Aenesidemus. Extracts of the ten modes are found in Photius (*cod.* 212).

Briefly, the ten modes are as follows: (1) The feelings and perceptions of all living beings differ. (2) People have physical and mental differences, which make things appear different to them. (3) The different senses give different impressions of things. (4) Our perceptions depend on our physical and intellectual conditions at the time of perception. (5) Things appear different in different positions, and at different distances. (6) Perception is never direct, but always through a medium. For example, we see things through the air. (7) Things appear different according to variations in their quantity, color, motion, and temperature. (8) A thing impresses us differently when it is familiar and when it is unfamiliar. (9) All supposed knowledge is predication. All predicates give us only the relation of things to other things or to ourselves; they never tell us what the thing in itself is. (10) The opinions and customs of people are different in different countries.

Affection

In the history of ethics, the term "affection" referred to a subset of emotions which were frequently designated as being less violent and less sensuous than "passions". St. Augustine, as quoted and adopted by Aquinas, says, "Those mental states (motus animi) which the Greeks call *pathe*, and Cicero calls *perturbationes*, are by some called *affectus* or *affectiones* by others, keeping to the literal rendering of the Greek *passiones*" (S.T. II.i.Q.22). This equivalence of *passio* and *affectus* is still found in Descartes. There is an alternative use in Spinoza, by whom the term *affectus* is made to cover purely rational sentiments (*Ethics*, III. 58 ff). And this alternative application is characteristic of the British moralists, in whose writings the word "affection" occurs frequently. Shaftesbury uses it in the widest sense above. But other writers draw a distinction between affection and passion. For example, Hutcheson does so on the ground that affection does not necessarily involve uneasiness, although passion does. Price distinguishes between the two because of the distinct presence of a sensuous element in passion, which also indicates greater vehemence. According to Gay, passion is the "pleasure or pain arising from the prospect of future pleasure or pain," and affection is "the desire consequent thereupon" (*Dissertation*). Reid defines affections as the "various principles of action in man, which have persons for their immediate object, and imply, in their very nature, our being well or ill affected to some person, or, at least, to some animated being" (*Active Powers*, Essay 3, Part 2, ch. 3-5). This usage is followed by Sidgwick.

Anarchism

Anarchism as a doctrine of political philosophy maintains that every form of government is harmful, and that the individual should be absolutely free to act as he things proper. Godwin's *Political Justice* (1793) is the first modern expression of this view insofar as the ultimate goal of political progress is "the dissolution of political government, of that brute engine, which has been the only perennial spring of the vices of mankind (Bk. 5, Ch. 24, end).

The growth of modern anarchism may be dated from the writings of Pierre Joseph Proudhon (1809-1865), particularly his principal work, *The Philosophy of Misery* (1846. Himself a laborer, Proudhon expressed the misery of his class which, foreshadowing communism, he attributed to capitalist competition and monopoly. No satisfactory state of things was attainable, he thought, until the laborer received the whole produce of his labor. However, he looked for the remedy in unlimited individual freedom, not in state control.

The next major proponent of anarchism was the German schoolmaster, Caspar Schmidt (1806-1856) who wrote under the pseudonym Max Stirner in his work *The Individual and his Property* (1864). Schmidt rejected not only all existing authorities, both secular and religious, but every idea, such as God or humanity, which tended to limit the absolute self-determination of the individual. "I derive all right and justification from myself alone; for I am entitled to everything which I have power to take or to do." For several years anarchism appeared to be on the decline, and was not a political force. The revival of anarchism, and the fullest development of it are the product of 19th century revolutionaries. Of noble birth, and at first an officer in the Russian army, Michael Bakunin (1814-1896)maintained that anarchy was the only tolerable state of humans. For him, the destruction of all existing laws, institutions, and beliefs was indeed our principal duty. Bakunin's writings, though numerous, are fragmentary.

Anaxagoras (500-428 BCE.)

Anaxagoras was a Greek philosopher of Clazomenae in Asia Minor, born about 500 BCE. Aristotle describes him to have been older than Empedocles, but to come 'after him in his works'. It is not clear whether this means that he wrote later than Empedocles or that he was inferior to him in his achievements. From a noble family, but wishing to devote himself entirely to science, he gave up his property to his relatives, and removed to Athens, where he lived in intimacy with Pericles. Shortly before the outbreak of the Peloponnesian War he was charged by the political opponents of Pericles with impiety, that is, with denying the gods recognized by the State. Though acquitted through his friend's influence, he felt compelled to emigrate to Lampsacus, where he died soon after, aged seventy-two. He not only had the honor of giving philosophy a home at Athens, where it flourished for a thousand years, but he was the first philosopher who introduced a spiritual principle which gives matter life and form. He laid down his doctrine in a prose work, "On Nature," written in the Ionic dialect, of which only fragments are preserved.

Like Empedocles, he started from the Parmenidean account of 'what is'. Also like Empedocles, Anaxagoras postulated a plurality of independent elements which he called 'seeds'. They are the ultimate elements of combination and are indivisible, imperishable *primordia* of infinite number, and differing in shape, color, and taste. Later writers referred to the seeds as *omoiomereia* (from an expression of Aristotle), meaning particles of like kind with each other and with the whole that is made up of them. They were not, however, the 'four roots', fire, air, earth, and water; on the contrary, these were compounds. Empedocles had supposed that bone, for instance, could be explained as a compound of the elements in a certain proportion, but this did not satisfy Anaxagoras. He pointed out that from bread and water arose hair, veins, 'arteries', flesh, muscles, bones, and the rest, and he asked 'How can hair be made of what is not hair, and flesh of what is not flesh?' (fr. 10). These words read like a direct criticism of Empedocles.

Anaxagoras had been an adherent of 'the philosophy of Anaximines', and he kept as close to it as he could in the details of his cosmology. He could not say that everything was 'air' more or less rarefied or condense, for that view had been destroyed by Parmenides. If the world was to be explained at all, an original plurality must be admitted. He therefore substituted for the primary 'air' a state of the world in which 'all things were together, infinite both in quantity and in smallness' (fr. 1). This is explained to mean that the original mass was infinitely divisible, but that, however far division was carried, every part of it would still contain all 'things', and would in that respect be just like the whole. That is the very opposite of the doctrine of 'elements', which seems to be expressly denied by the dictum that 'the things that are in one world are not separated from one another or cut off with a hatchet' (fr. 8). Everything has 'portions' of everything else in it.

But if that were all, we should be no nearer an explanation of the world than before; for there would be nothing to distinguish one 'seed' from another. The answer to this is that, though each thing has a 'portion' of everything in it, however minutely it may be divided, some have more of

one thing and others more of another. This was to be seen already in the original undifferentiated mass where 'all things were together'; for there the portions of air and 'aether' (by which words Anaxagoras means fire) were far more numerous than the others, and therefore the whole had the appearance of air and 'aether'. Anaxagoras could not say it actually was air, as Anaximenes had done, because he had discovered for himself or learned from Empedocles the separate corporeal existence of atmospheric air. We have some references to the experiments by which he demonstrated this. He used inflated skins for the purpose. The effort to depart as little as possible from the doctrine of Anaximenes is nevertheless apparent.

We see, then, that the differences which exist in the world as we know it are to be explained by the varying proportions in which the portions are mingled. 'Everything is called that of which it has most in it', though, as a matter of fact, it has everything in it. Snow, for instance, is black as well as white, but we call it white because the white so far exceeds the black. As was natural, the 'things' Anaxagoras chiefly thought of as contained in each 'seed' were the traditional opposites, hot and cold, wet and dry, and so forth. It is of these he is expressly speaking when he says that 'the things in one world are not cut off from one another with a hatchet' (fr. 8). Empedocles had made each of these four opposites a 'root' by itself; each of the 'seeds' of Anaxagoras contains them all. In this way he thought he could explain nutrition and growth; for it is clear that the product of a number of 'seeds' might present quite a different proportion of the opposites than any one of them if they were taken severally.

The other problem, that of the source of motion, still remains. How are we to pass from the state of the world when all things were together to the manifold reality we know? Like Empedocles, Anaxagoras looked to the microcosm for a suggestion as to the source of motion, but he found one such source sufficient for his purpose. He called it Mind (nous) -- pure, passionless reason. It is the source of motion as well as of knowledge in us. He did not, however, succeed in forming the conception of an incorporeal force. Mind, as the cause of motion, is a sort of 'fluid'. It is 'the thinnest of all things' (fr. 12), and, above all, it is 'unmixed', that is to say, it has no portions of other things in it, and this is what gives it the 'mastery', that is, the power both of knowing and of moving other things. Further, it enters into some things and not into others, and that explains the distinction between the animate and the inanimate. At first the seeds lay mingled without order; but *nous* set the unarranged matter into motion, and thereby created out of chaos an orderly world. The way in which it separates and orders things is by producing a rotatory motion, which begins at the center and spreads further and further. That is really all Anaxagoras had to say about it. Like a true Ionian he tried to give a mechanical explanation of everything he could, and, when once he had got the rotatory motion started, he could leave that to order the rest of the world.

Though Empedocles had distinguished Love and Strife as the causes of mixture and separation from the four elements which are mixed and separated, he continued to call them all 'gods' in the sense with which we are now familiar, and he gave the name also to the Sphere in which they were all mixed together. Anaxagoras seems to have taken the stop of calling only the source of motion 'god'. In that sense and to that extent it is not incorrect to call him the founder of theism. On the other hand, it seems to have been precisely for this that his contemporaries called him an atheist. In his desire to exalt Nous, he seems to have followed the lead of Xenophanes in denying the divinity of everything else, and his statements about the sun and the moon are usually mentioned in connection with the charge of irreligion brought against him, though we cannot tell now what that referred to, or whether the charge was well founded or not. We can only say that Pericles shared

the secular spirit of the Ionians, and it is quite conceivable that his immediate circle may have offended the religious susceptibilities of old-fashioned Athenians by ridiculing ceremonies which were still sacred in their eyes.

Anaxarchus (4th cn. BCE.)

Anaxarchus was a philosopher of Abdera, from the school of Democritus, who flourished about the 110th Olympiad. He is remembered for having lived with Alexander and enjoyed his confidence. When Alexander was torn with regret for having killed his faithful Clitus, Anaxarchus said, "kings, like the gods, could do no wrong." Anaxarchus was addicted to pleasure. It was because of this (and not because of the apathy and tranquillity of his life) that he obtained the surname of "the Fortunate." Cicero relates a story that Anaxarchus was pounded to death in an iron mortar by Nicocreon, king of Cyprus, in revenge for the advice which he gave to Alexander, to serve up the head of that prince at an entertainment.

Anaximander (611-547 BCE.)

Anaximander was a Greek philosopher of Miletus, born 611 BCE., and hence a younger contemporary of Thales and Pherecydes. He lived at the court of Polycrates of Samos, and died 547. He wrote a prose work in the Ionic dialect of which on fragment survives. Anaximander thought it unnecessary to fix upon air, water, or fire as the original and primary form of body. He preferred to represent it simply as a boundless something from which all things arise and to which they all return again. He was struck by a fact which dominated all subsequent physical theory among the Greeks, namely, that the world presents us with a series of opposites, of which the most primary are hot and cold, wet and dry. If we look at things from this point of view, it is more natural to speak of the opposites as being 'separated out' from a mass which is as yet undifferentiated than it is to make any one of the opposites the primary substance. Anaximander argued that Thales made the wet too important at the expense of the dry. Some such thought, at any rate, appears to underlie the few words of the solitary fragment of his writing that has been preserved. He said that things 'give satisfaction and reparation to one another for their injustice, as is appointed according to the ordering of time.' This conception of justice and injustice recurs more than once in Ionic natural philosophy, and always in the same connection. It refers to the encroachment of one opposite or 'element' upon another.

The formation of the world is due to the 'separating out' of the opposites. Anaximander's view of the earth is a curious mixture of scientific intuition and primitive theory. On the one hand, the earth does not rest on anything, but swings free in space. The reason he gave was that there is nothing to make it fall in one direction rather than in another. He inferred this because his system was incompatible with the assumption of an absolute up and down. On the other hand, though, he gives the earth a shape intermediate between the disc of Thales and the sphere of the Pythagoreans. He regarded it as a short cylinder 'like the drum of a pillar'. With regard to living beings, Anaximander held that all life came from the sea, and that the present forms of animals were the result of adaptation to a fresh environment. It is possible that some of this biological theories were grotesque in detail, but it is certain that his method was thoroughly scientific. He was much impressed by the observation of certain sharks or dogfish, and evidently regarded them as an intermediary between fishes and land animals. His proof that man must have been descended from an animal of another species has a curiously modern ring. The young of the human species require a prolonged period of nursing, while those of other species soon find their food for themselves. If, then, man had always been as he is now he could never have survived.

The Internet Encyclopedia of Philosophy

Anaximenes (d. 502 BCE.)

Anaximenes was a Greek philosopher of Miletus, a younger contemporary and pupil of Anaximander, who died about 502. He was not a great original genius like Anaximander, and in some respects his cosmology falls far short of his predecessor's. His title to remembrance is based on his discovery of the formula which for the first time made the Milesian theory coherent: of rarefaction and condensation. He regarded 'air' -- the air we breathe, but also that which thickens into mist and water -- as the primary form of body; it holds an intermediate stage between water and fire. Thus, his theory resembles that of Thales. On the other hand, he thought of this air as boundless and as containing an infinite number of worlds, in this respect following Anaximander. The solitary fragment quoted form his work shows that he was influenced by the analogy of the microcosm and the macrocosm. 'As our soul,' he says, 'which is air, holds us together, so do breath and air encompass the whole world.' The world is thought of as breathing or inhaling air from the boundless mass outside it. This air he spoke of as a 'god'.

It is maintained that the Milesian cosmology was based on the primitive and popular theory of 'the four elements'. However, the scientific conception of an 'element' did not exist at this date. We shall see later that this was due to Empedocles, and it is only the place that the old quaternion of Fire, Air, Earth, and Water occupied in his system (and afterwards in that of Aristotle) that has led to these being called 'the four elements'. It is an unfortunate confusion, but it is very difficult to avoid it, and we must continue to use the word 'element' in two senses which have very little to do with one another. The spirit of Ionian civilization had been thoroughly secular, and this was one of the causes that favored the rise of science. The Milesian school came to an end with the fall of Miletus in 494 BC, but 'The Philosophy of Anaximenes', as it was called, continued to be taught in other Ionian cities.

Animal Rights

The applied ethical issue of animal rights involves a consideration of the moral status of nonhuman animals, and to what extent that status impacts on an animal's right to life or to be free from pain. Advocates of animal rights frequently begin their discussions noting the suffering that humans routinely inflict on animals. Experimenting on live animals is an integral part of the biological sciences. Government regulations require that industries use animals as test cases for determining the toxicity levels of drugs, cosmetics, cleaners, and other industrial and household products. In commercial animal agriculture, cows, pigs, and chickens are raised and slaughtered in deplorable conditions. In his book *Animal Liberation* (1975) Peter Singer describes in graphic detail the conditions that calves are subjected to in veal production. For 15 weeks, calves are confined to tiny stalls that restrict their movement so their muscles will not become tough, and thus reduce the value of their meat. "The narrow stalls and their slatted wooden floors are a serious source of discomfort for the calves. The inability to turn around is frustrating. When he lies down, the calf must lie hunched up, sitting almost on top of his legs.... A stall too narrow to turn around in is also too narrow to groom comfortably in; and calves have an innate desire to twist their heads around and groom themselves with their tongues." Calves are also prevented from fulfilling other innate drives, such as contact with their mothers, and to take in roughage and chew cud. "Calves kept in this manner are unhappy and unhealthy animals." One in ten calves do not survive the fifteen weeks.

Examples such as this suggest the need to examine our moral responsibility toward animals. Theories of the moral status of animals fall into two main groups: those advocating indirect obligations toward animals, and those advocating direct obligation s toward animals.

INDIRECT DUTIES TO ANIMALS. Philosophers from past centuries typically held that our obligations toward animals are only indirect, and derived from purely human interests. For these philosophers, animals are unconscious biological organisms that operate by brute instinct, and only appear to be capable of experiencing pain. Aquinas argues that God established a hierarchy of life forms in nature so that the lower forms may be killed and eaten by the higher forms. Specifically, plants are to be killed by animals for food, and animals are to be killed by humans for food. For Aquinas, animals lack reason and exhibit motion "by a kind of natural impulse." This indicates that they "are naturally enslaved and accommodated to the uses of others." Aquinas explains that animals are the property of humans and, as personal property, it may be wrong to harm someone else's animal. Malebranche offered the theological argument that all suffering is a consequence of Adam's sin and, since animals are not descended from Adam, then they cannot feel pain.

Rene Descartes argues that animals are only biological automata - or robots - which lack minds and souls. Descartes argues that there are two possible sources of motion in the physical world: mind and purely mechanical force. Although our human motion is activated by mind, animal motion is activated by purely mechanical force. Descartes warns that we may be tempted to ascribe animal motion to mental causes because animals have body parts that look like ours, and animals sometimes act in ways that look

like ours. However, Descartes insists that we should not be misled by these superficial similarities with humans. Even parts of human biology are purely mechanical, and Descartes points out, even humans can create human-looking machines that move merely by mechanical force. Descartes believes that the strongest reason for denying animals minds is the fact that animals do not engage in sophisticated language, which is the prime indicator of rationality.

Immanuel Kant argues that we do not have direct duties towards animals, but only indirect ones. Similar to Descartes' reasoning, Kant points out that animals are not self-conscious. Similar to Aquinas, Kant believes that animals are put here for human purposes. Kant recognizes, though, that how we treat animals has an impact on how we treat fellow humans - towards whom we have direct duties. For example, it is wrong to torture animals, not for the animal's sake, but because this desensitizes people towards suffering which they may then inflict on another person. For Kant, then, the obligation toward animals is indirect since it derives from human interests alone.

DIRECT DUTIES TO ANIMALS. Against the views of Aquinas, Descartes, and Kant, more recent philosophers have argued that animals have a direct moral standing, and therefore should not be inflicted with pain for their own sake, and not merely for the sake of how this affects humans. On this view, many animals are clearly conscious and capable of experiencing pleasure and pain. This fact alone entitles them to a direct moral standing, at least in that capacity. Classical utilitarianism in particular maintains that moral actions are those that promote the greatest amount pleasure and the least amount of pain. Since animals experience pleasure and pain, then their interests count directly in the tally. This is the position advocated by Singer in his book Animal Liberation cited above.

The expression "animal rights" is often used symbolically by those who believe we have a direct obligation to prevent animal suffering. However, *The Case for Animal Rights* Tom Regan takes this expression literally and argues that the key moral rights of higher animals are the same as those moral rights of humans. For Regan, some higher animals are like humans insofar as they have preferences, beliefs, expectations. These characteristics designate that such animals have intrinsic worth and therefore have the same fundamental rights to life that humnas do. He argues that the problem with current attitudes is that they view animals as resources, and not as beings with inherent value. Regan rejects theories of indirect obligation towards animals which maintain that animals are not capable of feeling pleasure and pain. He also challenges social contract theory which holds that, even though animals feel pain, human pain is the only pain that is morally significant. For, direct obligations apply only to those who contract into a moral system, and this requires understanding the nature of the contract. Morality is like a club you can join, only if you know the rules of the club. And, since animals cannot understand the rules of the club, they cannot be members and thus cannot have a direct moral standing. Animals such as dogs and cats have a special place in the hearts of club members, so these animals acquire an indirect moral standing. But, other animals such as rats are not cared about so their moral standing is virtually non-existent. Regan criticizes contractarianism since, in theory, it could make morality into a highly selective club, and exclude members on the basis of gender, race, religion, or any other arbitrary factor. For Regan, even Rawls's contractarianism excludes people who do not have a sense of justice.

Regan also criticizes some accounts of direct duties toward animals since, in his view, they do not go far enough. The utilitarian view, noted above, fails on two accounts. First, utilitarinism is concerned only with the desires of a being (such as the desire for pleasure). But it takes no regard for the inherent worth of these beings (human or animal). Second, Regan cites the classic problem of utilitarianism that it would be morally permissible to arbitrarily make an individual suffer for the benefit of the greater good. For Regan, the best theory of morality will be one that grants rights to all beings who have inherent worth. This prevents morality from becoming an exclusive club (as in contractarianism), and does not allow

individuals to be exploited on behalf of the greater good (as in utilitarianism. Regan explains that a being has inherent worth when it is a subject of a life; that is, the being has preferences, beliefs, feelings, recollections, and expectations. Many animals exhibit these features and therefore have inherent worth and are rights holders. Regan criticizes alternative criteria of inherent worth. To say that only intelligent beings have inherent worth will exclude infants and mentally impared people, which is inadequate. To say that only homo sapiens have inherent value is a form of bigotry which we may call speciesism. Regan concludes by noting that the animal rights movement should be seen as part of the human rights movement. Also, on his theory, no animal experimentation or commercial animal agriculture is morally permissible.

In opposition to animal rights advocates such as Regan, in his essay "Do Animals Have Rights" Tibor R. Machan argues that animals cannot be moral agents since no moral demands can possibly be made of them. Machan attacks all theories that extend direct obligations to animals, including both Regan's view and the utilitarian view. He notes two reasons for why some believe that animals have rights. First, following Darwin, it has been argued that humans and animals differ only in degree, not in kind. Thus, it is improper to draw a clear line between humans as rights-holders, and animals as nonrights-holders. Machan argues we are justified in using animals for our human purposes since we are more important than animals (although not uniquely important). Machan notes that within nature there is a scale of importance, where animals are more important than rocks. Further, at each level in nature, there are distinct criteria that make some members of that species better than others. For example, an oak that resists disease is better than an oak which does not. A carnivore with claws is better than it would be without claws. Distinctly moral criteria enter only when we reach the human level. For, only humans are judged better or worse on moral criteria. For Machan, our fundamental human task is to succeed as human beings, which requires that we learn. Learning, in turn, often involves using animals, as with animal experiments in the field of medicine.

Machan next discusses the nature of moral rights, why humans have them, and why animals do not. For Machan, rights come from the capacity to make moral choices and the need to exhibit morally responsible behavior. For example, we have rights to life, liberty and property since these are central to the task of acting with moral responsibility. For, rights provide us with a clear area of personal jurisdiction where our authority to act is respected and protected. However, in the animal world, there is no notion of moral responsibility, hence there is no basis for animal rights. Machan addresses a potential criticism at this point. For, Bernard Rollin argues that some animals exhibit behavior that is similar to moral responsibility. For example, elephants feed injured members of their species. Thus, for Rollin, there is no clear distinction between human and nonhuman animals. Machan responds by noting, along with Mortimer Adler, that even within evolutionary theory, species distinctions are not blurry: there are "genetically isolated populations where interbreeding is impossible. Machan's point is that, given the rigid distinction between the human species and other species, the notion of moral responsibility is a distinctly human notion, and therefore is not found in animal societies (in spite of superficial similarities). There is, then, no room for the notion of animal rights.

Anselm of Canterbury (1033-1109)

LIFE. The father of medieval scholasticism and one of the most eminent of English prelates was born at Aost Piedmont in 1033. Anselm died at Canterbury, England on April 21, 1109. While a boy he wished to be a monk, but his father forbade it. When he was about twenty-three Anselm left home to live in Burgundy and France. After three years he went to Bec in Normandy where his celebrated countryman, Lanfranc, was prior. Here he became a monk (1060). He succeeded Lanfranc as prior in 1063, and became abbot in 1078. The abbey had possessions in England, which called Anselm frequently to that country. He was the general choice for archbishop of Canterbury when Lanfranc died (1089). However, the king, William Rufus, preferred to keep the office vacant, and apply its revenues to his own use. In 1093 William fell ill and, literally forced Anselm to receive an appointment at his hands. He was consecrated December 4 of that year. The next four years witnessed a continual struggle between king and archbishop over money matters, rights, and privileges. Anselm wished to carry his case to Rome, and in 1097, with much difficulty, obtained permission from the king to go. At Rome he was honored and flattered, but he obtained little practical help in his struggle with the king. He returned to England as soon is he heard of the death of William in 1100. But a difficulty arose over lay investiture and homage from clerics for their benefices. Thought a mild and meek man, Anselm had adopted the Gregorian views of the relation between Church and State, and adhered to them with the steadiness of conscientious conviction. The king, though inclined to be conciliatory, was equally firm from motives of self-interest. He had a high regard for Anselm, always treated him with much consideration, and personal relations between them were generally friendly. Nevertheless there was much vexatious disputing, several fruitless embassies were sent to Rome, and Anselm himself went thither in 1103, remaining abroad till 1106. His quarrel with the king was settled by compromise in 1107 and the brief remaining period of his life was peaceful. He was canonized in 1494.

PHILOSOPHICAL WRITINGS. As a metaphysician Anselm was a realist, and one of his earliest works, *De fide Trinitatis,* was an attack on the doctrine of the Trinity as expounded by the nominalist Roscelin. His most celebrated works are the *Monologium* and *Proslogium,* both aiming to prove the existence and nature of God. The *Cur deus homo*, in which he develops views of atonement and satisfaction which are still held by orthodox theologians. The two first named were written at Bec. The last was begun in England " in great tribulation of heart," and finished at Schiavi, a mountain villaffe of Apulia, where Anselm enjoyed a few months of rest in 1098. His meditations and prayers are edifying and often highly impressive. In the Monologium he argues that from the idea of being there follows the idea of a highest and absolute, i.e. self-existent Being, from which all other being derives its existences revival of the ancient cosmological argument.

In the *Proslogium* the idea of the perfect being-" than which nothing greater can be thought "-cannot be separated from its existence. For if the idea of the perfect Being, thus present in consciousness, lacked existence, a still more perfect Being could be thought, of which existence would be a necessary metaphysical predicate, and thus the most perfect Being would be the

absolutely Real. In its most simple form, this first version of the ontological argument is as follows:

1. **The term "God" is defined as the greatest conceivable being**
2. **Real existence (existence in reality) is greater than mere existence in the understanding**
3. **Therefore, God must exist in reality, not just in the understanding.**

Anselm's main intuition is that the greatest possible being has every attribute which could make it great or good. Existence in reality is one such attribute. Anselm's actual argument is more complex than this, and is often reconstructed as a reductio ad absurdum (reduction to absurdity). Reductio arguments have two parts: a target argument, and a concluding argument which reduces the target argument to absurdity. His argument begins with some general assumptions which include the idea that (a) God exists in the understanding (b) Existence in reality is greater than existence in the understanding alone. The first assumption simply means that we understand and can consistently think about the concept of God (whereas we could not think about the concept of a square circle, for instance). The second means that a real x is greater than an imaginary or merely conceived x (e.g. a real $100 is greater than an imaginary $100). Gaunilo, a contemporary monk of Anselm, wrote an attack on Anselm's argument titled "on behalf of the fool." He offers several criticisms, the most well known is a parody on Anselm's argument in which he proves the existence of the greatest possible island. If we replaced "an island than which none greater can be conceived" for "something than which nothing greater can be conceived" then we would prove the existence of that island. Gaunilo's point was that we could prove the existence of almost anything using Anselm's style of argument. The ontological argument is therefore unsound.

THEOLOGY. The key to Anselm's theory of the Atonement was the idea of "satisfaction." In justice to himself and to the creation, God, whose honor had suffered injury by man's sin, must react against it either by punishing men, or, since he was merciful, the death of the God-man, which will more than compensate for the injury to his honor, on the ground of which lie forgives sin. Incidental features of his theory are 1) sin as a violation of a private relation between God and man, 2) the interaction of the divine righteousness and grace, and 3) the necessity of a representative suffering. In the Reformed doctrine, sin and the Atonement took on more of a public character, the active obedience of Christ was also emphasized, and the representative relation of Christ to the law brought to the front. In the seventeenth century the forensic and penal justice of God came into prominence. Christ was conceived of as suffering the punishment of our sin,-a complete equivalent of the punishment which we must have suffered, -on the ground of which our guilt and punishment are pardoned. In the following century, Owen held that the sufferings of Christ for sinners were not tantident but idein. In more recent discussions along this line, Hodge maintains that Christ suffered neither the kind nor degree of that which sinners must have suffered, but any kind and degree of suffering which is judicially inflicted in satisfaction of justice and law. There has indeed been no theory of the work of Christ which has not conceived of it is a satisfaction. Even the so-called moral influence theories center in this idea. It is therefore evident how fundamental is the idea of satisfaction presented by Anselm. Only it must be observed first that in the evolution of the Christian doctrine of salvation the particular way in which the satisfaction was realized has been differently conceived; and secondly, if the forgiveness of sin in Jesus Christ takes place only when the ethical nature of God is satisfied, the special form in which the satisfaction is accomplished is of subordinate importance. In one class of views-the representative or juridical-the satisfaction was conditioned on a unique and isolated divine-human deed-the death or the life and death of Christ; in the other theories, the satisfaction is threefold in

the expression of the divine good-will, through the life and death of Christ, in the initial response of sinners to forgiving grace, and in the final bringing of all souls to perfect union with the Father.

Antisthenes (440-370 BCE.)

Antisthenes was an Athenian philosopher and founder of the Cynic sect. Antisthenes was born in Athens about 440 BCE. of a Phrygian or Thracian mother, and thus was only a half citizen. In his youth he was engaged in military exploits, and acquired fame by the valor which he displayed in the battle of Tanagra. His first studies were under the direction of the sophist Gorgias, who instructed him in rhetoric. Soon growing dissatisfied with the futile labours of this school, he sought for more substantial wisdom from Socrates. Captivated by the doctrine and the manner of his new master, he prevailed upon many young men, who had been his fellow-students under Gorgias, to accompany him. So great was his ardor for moral wisdom, that, though he lived at the Piraeus, he came daily to Athens to listen to Socrates. While he was a disciple of Socrates, he exhibited a severity of manners by his unkept dress. He frequently appeared in a threadbare and ragged cloak. An anecdote relates that Socrates, remarked that Anthisthenes took pains to expose, rather than to conceal the tattered state of his dress, and said to him, "Why so ostentatious? Through your rags I see your vanity." After the death of Socrates in 339 BCE. Antisthenes established a school in the only gymnasium open to half-Athenian descent. The place was called Cynosarges, hence his followers bore the name "Cynics". It is also argued that the followers were called Cynics from the habits of the school, which, to the more refined Athenians, appeared those of dogs rather than of men. Towards the close of his life, the gloomy cast increased to such a degree as to become troublesome to his friends, and the object of ridicule to his enemies. He lived to the age of seventy. Antisthenes wrote many books, of which none are extant except two declamations under the names of Ajax and Ulysses (although their genuiness is disputed).

Teaching. Like Socrates, he regarded virtue as necessary -- indeed, alone sufficient -- for happiness, and to be a branch of knowledge that could be taught, and that once acquired could not be lost. Its essence consists in freedom from wants by the avoidance of evil (by evil meaning pleasure and desire). Regarding his religious views, Antisthenes maintained that, in the universe, everything is regulated by a divine intelligence, from design, so to benefit the good person who is the friend of God. For the sage shall possess all things. This doctrine was connected with his ethical views, by indicating the physical conditions of a happy life. However, it led him to declare that there is but one natural God, but many popular deities; that God cannot be known or recognized in any form or figure, since he is like nothing on earth. Hence undoubtedly arose his allegorical explanation of mythology.

In addition to his precepts, he also taught by example. He wore no other garment than a coarse cloak, did not cut his beard, and carried a sack and staff like a wandering beggar. This was meant as an expression of opposition to the gradually increasing luxury of the age, intending to bring men back to their original simplicity in life and manners. Antisthenes appears to have been carried to excess in his virtuous zeal against the luxury, although the accounts which have come down to us respecting him may be exaggerated. In any case, his contention with the tendency of his age

brought negative reaction from his contemporaries. Indeed, his school met with so little encouragement, that, in annoyance, he drove away the few scholars he had. Diogenes of Sinope, who resembled him in character, is said to have been the only one that remained with him to his death.

Applied Ethics

Applied ethics is the branch of ethics which consists of the analysis of specific, controversial moral issues such as abortion, animal rights, and euthanasia. In recent years applied ethical issues have been subdivided into convenient groups such as medical ethics, business ethics, environmental ethics, sexual ethics, and social ethics. Generally speaking, two features are necessary for an issue to be considered an "applied ethical issue." First, the issue needs to be controversial in the sense that there are significant groups of people both for and against the issue at hand. The issue of drive-by shooting, for example, is not an applied ethical issue, since virtually everyone agrees that this practice is grossly immoral. By contrast, the issue of g un control would be an applied ethical issue since there are significant groups of people both for and against gun control.

The second requirement for in issue to be an applied ethical issue is that it must be a distinctly moral issue. On any given day, the media presents us with an array of sensitive issues such as affirmative action policies, gays in the military, invol untary commitment of the mentally impaired, capitalistic vs. socialistic business practices, public vs. private health care systems, or energy conservation. Although all of these issues are controversial and have an important impact on society, they are n ot all moral issues. Some are only issues of social policy. The aim of social policy is to help make a given society run efficiently by devising conventions, such as traffic laws, tax laws, and zoning codes. Moral issues, by contrast, concern more univers ally obligatory practices, such as our duty to avoid lying, and are not confined to individual societies. Frequently, issues of social policy and morality overlap, as with murder which is both socially prohibited and immoral. However, the two groups of is sues are often distinct. For example, many people would argue that sexual promiscuity is immoral, but may not feel that there should be social policies regulating sexual conduct, or laws punishing us for promiscuity. Similarly, some social policies forbid residents in certain neighborhoods from having yard sales. But, so long as the neighbors are not offended, there is nothing immoral in itself about a resident having a yard sale in one of these neighborhoods. Thus, to qualify as an applied ethical issue, the issue must be more than one of mere social policy: it must be morally relevant as well.

In theory, resolving particular applied ethical issues should be easy. With the issue of abortion, for example, we would simply determine its morality by consulting our normative principle of choice, such as act-utilitarianism. If a given abortion pr oduces greater benefit than disbenefit, then, according to act-utilitarianism it would be morally acceptable to have the abortion. Unfortunately, there are perhaps hundreds of rival normative principles from which to choose, many of which yield opposite c onclusions. Thus, the stalemate in normative ethics between conflicting theories prevents us from using a single decisive procedure for determining the morality of an issue. The solution to this stalemate is to consult several representative normative pri nciples on a given issue and see where the weight of the evidence lies.

NORMATIVE PRINCIPLES USED IN APPLIED ETHICAL DISCUSSIONS. Arriving at a short

list of representative normative principles is itself a challenging task. The principles selected must not be too narrowly focused, such as a version of act-egoism which mi ght focus only on an action's short-term benefit. The principles must also be seen as having merit by people on both side of an applied ethical issue. For this reason, principles which appeal to our duty to God are not usually cited since this would have no impact on a nonbeliever engaged in the debate. The following principles are the ones most commonly appealed to in applied ethical discussions:

- **Personal benefit: acknowledge the extent to which an action produces beneficial consequences for the individual in question.**
- **Social benefit: acknowledge the extent to which an action produces beneficial consequences for society.**
- **Principle of benevolence: help those in need.**
- **Principle of paternalism: assist others in pursuing their best interests when they cannot do so themselves.**
- **Principle of harm: do not harm others.**
- **Principle of honesty: do not deceive others.**
- **Principle of lawfulness: do not violate the law.**
- **Principle of autonomy: acknowledge a person's freedom over his/her actions or physical body.**
- **Principle of justice: acknowledge a person's right to due process, fair compensation for harm done, and fair distribution of benefits.**
- **Rights: acknowledge a person's rights to life, information, privacy, free expression, and safety.**

The above principles represent the spectrum of traditional normative principles and are derived from specific consequentialist and non-consequentialist theories. The first two principles, personal benefit and social benefit, are consequentialist sin ce they appeal to the consequences of an action as it affects the individual or society. The remaining principles are non-consequentialist and derive from duty-based and rights-based theories. The principles of benevolence, paternalism, harm, honesty, and lawfulness derive from non-consequentialist duties we have toward others. The principles of autonomy, justice, and the various rights derive from non-consequentialist moral rights.

An example will help illustrate the function of these principles in an applied ethical discussion. In 1982 a couple from Bloomington, Indiana gave birth to a severely retarded baby. The infant, known as Baby Doe, also had its stomach disconnected fro m its throat and was thus unable to receive nourishment. Although this stomach deformity was correctable through surgery, the couple did not want to raise a severely retarded child and therefore chose to deny surgery, food, and water for the infant. Local courts supported the parents' decision, and six days later Baby Doe died. Should corrective surgery have been performed for Baby Doe? Arguments in favor of corrective surgery derive from the infant's right to life and the principle of paternalism which s tipulates that we should pursue the best interests of others when they are incapable of doing so themselves. Arguments against corrective surgery derive from the personal and social disbenefit which would result from such surgery. If Baby Doe survived, it s quality of life would have been poor and in any case it probably would have died at an early age. Also, from the parent's perspective, Baby Doe's survival would have been a significant emotional and financial burden.

When examining both sides of the iss ue, the parents and the courts concluded that the arguments against surgery were stronger than the arguments for surgery. First, foregoing surgery appeared to be in the best interests of the infant given the poor quality of life it would endure. Second, t he status of Baby Doe's right to life was not clear given the severity of the infant's mental impairment. For, to possess moral rights, it takes more than merely having a human body: certain cognitive functions must also be present. The issue here involve s what is often referred to as moral personhood, and is central to many applied ethical discussions.

Apprehension

The term "apprehension" in the history of philosophy refers to the intellectual action or process by which a relatively simple object is understood, grasped, or brought before the mind.

In Aristotle's theory of the types of knowledge, stress is laid on the view that only judgments are properly true and false, while thought (nous), on precisely its highest levels, deals with objects which it is possible either to grasp directly, or to grasp not at all, but which it is impossible any longer to grasp falsely, or to misjudge, when one knows them. This act of attaining direct acquaintance with truth Aristotle metaphorically calls "apprehension", a touching, or direct contact with truth. Aristotle himself compares it to seeing. The term "apprehension," in scholastic usage, is a translation of the Aristotelian term. But the term has been from the outset of its usage extended to apply to various sorts of direct or simple knowledge, or knowledge involving acquaintance with objects, as opposed to complex, indirect, or discursive knowledge. The Aristotelian contrast between the knowledge capable of truth or falsity and the simple knowledge or apprehension incapable of truth or falsity has indeed been frequently retained, at least by more technical usage. But apprehension, even in case of such retention, has meant very frequently not higher grades of intuition, but rather sensory knowledge, or presentation, too simple to be a matter of truth or falsity. And other usage has abandoned altogether the contrast with judgment or belief, so that an apprehension becomes merely a comparatively simple cognition.

Thomas Aquinas (1225-1274)

LIFE. The birth-year of Thomas Aquinas is commonly given as 1227, but he was probably born early in 1225 at his father's castle of Roccasecea (75 m. e.s.e. of Rome) in Neapolitan territory. He died at the monastery of Fossanova, one mile from Sonnino (64 m. s.e. of Rome), Mar. 7, 1274. His father was Count Landulf of an old high-born south Italian family, and his mother was Countess Theodora of Theate, of noble Norman descent. In his fifth year he was sent for his early education to the monastery of Monte Cassino, where his father's brother Sinibald was abbot. Later he studied in Naples. Probably in 1243 he determined to enter the Dominican order; but on the way to Rome he was seized by his brothers and brought back to his parents at the castle of S. Giovanni, where he was held a captive for a year or two and besieged with prayers, threats, and even sensual temptation to make him relinquish his purpose. Finally the family yielded and the order sent Thomas to Cologne to study under Albertus Magnus, where he arrived probably toward the end of 1244. He accompanied Albertus to Paris in 1245, remained there with his teacher, continuing his studies for three years, and followed Albertus at the latter's return to Cologne in 1248. For several years longer he remained with the famous philosopher of scholasticism, presumably teaching. This long association of Thomas with the great polyhistor was the most important influence in his development; it made him a comprehensive scholar and won him permanently for the Aristotelian method. In 1252 probably Thomas went to Paris for the master's degree, which he found some difficulty in attaining owing to attacks, at that time on the mendicant orders. Ultimately, however, he received the degree and entered ceremoniously Upon his office of teaching in 1257; he taught in Paris for several years and there wrote certain of his works and began others. In 1259 he was present at an important chapter of his order at Valenciennes, At the solicitation of Pope Urban IV. (therefore not before the latter part of 1261), he took up his residence in Rome. In 1269-71 he was again active in Paris. In 1272 the provincial chapter at Florence empowered him to found a new *studium generale* at such place as he should choose, and he selected Naples. Early in 1274 the pope directed Mm to attend the Council of Lyons and he undertook the journey, although he was far from well. On the way he stopped at the castle of a niece and there became seriously ill. He wished to end his days in a monastery and not being able to reach a house of the, Dominicans he was carried to the Cistercian Fossanova. There, first, after his death, his remains were preserved.

WRITINGS. The writings of Thomas may be classified as, (1) exegetical, homiletical, and liturgical; (2) dogmatic, apologetic, and ethical; and (3) philosophical. Among the genuine works of the first class were: Commentaries on Job (1261-65); on Psalms, according to some a *reportatum*, or report of oral deliverances furnished by his companion Raynaldus; on Isaiah; the *Catena aurea*, which is a running commentary on the four Gospels, constructed on numerous citations from the Fathers; probably a Commentary on Canticles, and on Jeremiah; and wholly or partly *reportata*, on John, on Matthew, and on the epistles of Paul, including, according to one authority, Hebrews i.-x. Thomas prepared for Urban IV., *Officium de corpore Christi* (1264); and the following works may be either genuine or *reportata*: *Expositio angelicce salutationis*; *Tractatus de decem praeceptis*;

***Orationis dominico expositio; Sermones pro dominicis diebus et pro sanctorum solemnitatibus*; *Sermones de angelis, and Sermones de quadragesima*. Of his sermons only manipulated copies are extant. In the second division were*: In quatitor sententiarum libros,* of his first Paris sojourn; *Questiones disputatce*, written at Paris and Rome; *Questiones quodlibetales duodecini*; *Summa catholicce fidei contra gentiles* (1261-C,4); and *the Summa theologioe*. To the dogmatic works belong also certain commentaries, as follows*: Expositio in librum beati Dionysii de divinis nominibits*; *Expositiones primoe et secundce*; In *Boethii libros de hebdomadibus*; and *Proeclare quoestiones super librum Boethii de trinitate*. A large number of *opuscitla* also belonged to this group. Of philosophical writings there are cataloged thirteen commentaries on Aristotle, besides numerous philosophical *opuscula* of which fourteen are classed as genuine.**

SUMMA PART I: GOD. The greatest work of Thomas was the *Summa* and it is the fullest presentation of his views. He worked on it from the time of Clement IV. (after 1265) until the end of his life. When he died he had reached question ninety of part iii., on the subject of penance. What was lacking, was afterward added from the fourth book of his commentary on the "Sentences" of Peter Lombard as a *supplementum*, which is not found in manuscripts of the thirteenth and fourteenth centuries. The Summa consists of three parts. Part i. treats of God, who is the " first cause, himself uncaused *" (primum movens immobile*) and as such existent only in act (*actu*), that is pure actuality without potentiality and, therefore, without corporeality. His essence is *actus purus et perfectus*. This follows from the fivefold proof for the existence of God; namely, there must be a first mover, unmoved, a first cause in the chain of causes, an absolutely necessary being, an absolutely perfect being, and a rational designer. In this connection the thoughts of the unity, infinity, unchangeableness, and goodness of the highest being are deduced. The spiritual being of God is further defined as thinking and willing. His knowledge is absolutely perfect since he knows himself and all things as appointed by him. Since every knowing being strives after the thing known as end, will is implied in knowing. Inasmuch as God knows himself as the perfect good, he wills himself as end. But in that everything is willed by God, everything is brought by the divine will to himself in the relation of means to end. Therein God wills good to every being which exists, that is he loves it; and, therefore, love is the fundamental relation of God to the world. If the divine love be thought of simply as act of will, it exists for every creature in like measure: but if the good assured by love to the individual be thought of, it exists for different beings in various degrees. In so far as the loving God gives to every being what it needs in relation practical reason," affording the idea of the moral law of nature, so important in medieval ethics.

SUMMA PART II.: ETHICS. The first part of the Summa is summed up in the thought that God governs the world as the universal first cause. God sways the intellect in that he gives the power to know aid impresses the *species intelligibiles* on the mind, and he ways the will in that he holds the good before it as aim, and creates the *virtus volendi*. To will is nothing else than a certain inclination toward the object of the volition which is the universal good. God works all in all, but so that things also themselves exert their proper efficiency. Here the Areopagitic ideas of the graduated effects of created things play their part in Thomas's thought. The second part of the Summa (two parts, *prima secundae* and *secundae, secunda*) follows this complex of ideas. Its theme is man's striving after the highest end, which is the blessedness of the *visio beata*. Here Thomas develops his system of ethics, which has its root in Aristotle. In a chain of acts of will man strives for the highest end. They are free acts in so far as man has in himself the knowledge of their end and therein the principle of action. In that the will wills the end, it wills also the appropriate means, chooses freely and completes the consensus. Whether the act be good or evil depends on the

end. The "human reason" pronounces judgment concerning the character of the end, it is, therefore, the law for action. Human acts, however, are meritorious in so far as they promote the purpose of God and his honor. By repeating a good action man acquires a moral habit or a quality which enables him to do the good gladly and easily. This is true, however, only of the intellectual and moral virtues, which Thomas treats after the mariner of Aristotle; the theological virtues are imparted by God to man as a " disposition," from which the acts here proceed, but while they strengthen, they do not form it. The " disposition " of evil is the opposite alternative. An act becomes evil through deviation from the reason and the divine moral law. Therefore, sin involves two factors: its substance or matter is lust; in form, however, it is deviation from the divine law. Sin has its origin in the will, which decides, against the reason, for a changeable good." Since, however, the will also moves the other powers of man, sin has its seat in these too. By choosing such a lower good as end, the will is misled by self-love, so that this works as cause in every sin. God is not the cause of sin, since, on the contrary, he draws all things to himself. But from another side God is the cause of all things, so he is efficacious also in sin as *-ctio but not as *ens*. The devil is not directly the cause of sin, but he incites by working on the imagination and the sensuous impulse of man, as men or things may also do. Sin is original. Adam's first sin passes upon himself and all the succeeding race; because he is the head of the human race and "by virtue of procreation human nature is transmitted and along with nature its infection." The powers of generation are, therefore, designated especially as "infected." The thought is involved here by the fact that Thomas, like the other to the whole, he is just: in so far as he thereby does away with misery, he is merciful. In every work of God both justice and mercy are united and, indeed, his justice always presupposes his mercy, since he owes no one anything and gives more bountifully than is due. As God rules in the world, the "plan of the order of things" preexists in him; i.e., his providence and the exercise of it in his government are what condition as cause everything which comes to pass in the world. Hence follows predestination: from eternity some are destined to eternal life, while as concerns others "he permits some to fall short of that end." Reprobation, however, is more than mere foreknowledge; it is the "will of permitting anyone to fall into sin and incur the penalty of condemnation for sin." The effect of predestination is grace. Since God is the first cause of everything, he is the cause of even the free acts of men through predestination. Determinism is deeply grounded in the system of Thomas; things with their source of becoming in God are ordered from eternity as means for the realization of his end in himself. On moral grounds Thomas advocates freedom energetically; but, with his premises, he can have in mind only the psychological form of self-motivation. Nothing in the world is accidental or free, although it may appear so in reference to the proximate cause. From this point of view miracles become necessary in themselves and are to be considered merely as inexplicable to man. From the point of view of the first cause all is unchangeable; although from the limited point of view of the secondary cause miracles may be spoken of. In his doctrine of the Trinity Thomas starts from the Augustinian system. Since God has only the functions of thinking and willing, only two *processiones* can be asserted from the Father. But these establish definite relations of the persons of the Trinity one to another. The relations must be conceived as real and not as merely ideal; for, as with creatures relations arise through certain accidents, since in God there is no accident but all is substance, it follows that " the relation really existing in God is the same as the essence according to the thing." From another side, however, the relations as real must be really distinguished one from another. Therefore, three persons are to be affirmed in God. Man stands opposite to God; he consists of soul and body. The " intellectual soul" consists of intellect and will. Furthermore the soul is the absolutely indivisible form of man; it is immaterial substance, but not one and the same in all men (as the Averrhoists assumed). The soul's power of knowing has

two sides; a passive (the *intellectus possibilis*) and an active (the *intellectus agens*). It is the capacity to form concepts and to abstract the mind's images (species) from the objects perceived by sense. But since what the intellect abstracts from individual things is a universal, the mind knows the universal primarily and directly, and knows the singular only indirectly by virtue of a certain reflection. As certain principles are immanent in the mind for its speculative activity, so also a " special disposition of works," or the *synderesis* (rudiment of conscience), is inborn in the scholastics, held to creationism, therefore taught that the souls are created by God. Two things according to Thomas constituted man's righteousness in paradise-the *justitia originalis* or the harmony of all man's powers before they were blighted by desire, and the possession of the *gratia gratum faciens* (the continuous indwelling power of good). Both are lost through original sin, which in form is the " loss of original righteousness." The consequence of this loss is the disorder and maiming of man's nature, which shows itself in " ignorance, malice, moral weakness, and especially in *concupiscentia*, which is the material principle of original sin." The course of thought here is as follows: when the first man transgressed the order of his nature appointed by nature and grace, he, and with him the human race, lost this order. This negative state is the essence of original sin. From it follow an impairment and perversion of human nature in which thenceforth lower aims rule contrary to nature and release the lower element in man. Since sin is contrary to the divine order, it is guilt, and subject to punishment. Guilt and punishment correspond to each other; and since the "apostasy from the invariable good which is infinite," fulfilled by man, is unending, it merits everlasting punishment.

But God works even in sinners to draw them to the end by " instructing through the law and aiding by grace." The law is the " precept of the practical reason." As the moral law of nature, it is the participation of the reason in the all-determining eternal reason." But since man falls short in his appropriation of this law of reason, there is need of a "divine law." And since the law applies to many complicated relations, the practical dispositions of the human law must be laid down. The divine law consists of an old and a new. In so far as the old divine law contains the moral law of nature it is universally valid; what there is in it, however, beyond this is valid only for the Jews. The new law is " primarily grace itself " and so a " law given within," " a gift superadded to nature by grace," but not a " written law." In this sense, as sacramental grace, the new law justifies. It contains, however, an "ordering" of external and internal conduct, and so regarded is, as a matter of course, identical with both the old law and the law of nature. The *consilia* show how one may attain the end "better and more expediently" by full renunciation of worldly goods. Since man is sinner and creature, he needs grace to reach the final end. The" first cause " alone is able to reclaim him to the " final end." This is true after the fall, although it was needful before. Grace is, on one side, "the free act of God," and, on the other side, the effect of this act, the *gratia infusa* or *gratia creata*, a *habitus infusus* which is instilled into the "essence of the soul," "a certain gift of disposition, something supernatural proceeding from God into man." Grace is a supernatural ethical character created in man by God, which comprises in itself all good, both faith and love. Justification by grace comprises four elements: "the infusion of grace, the influencing of free will toward God through faith, the influencing of free will respecting sin, and the remission of sins." It is a "transmutation of the human soul, " and takes place "instantaneously." A creative act of God enters, which, however, executes itself as a spiritual motive in a psychological form corresponding to the nature of man. Semi-pelagian tendencies are far removed from Thomas. In that man is created anew he believes and loves, and now sin is forgiven. Then begins good conduct; grace is the "beginning of meritorious works." Thomas conceives of merit in the Augustinian sense: God gives

the reward for that toward which he himself gives the power. Man can never of himself deserve the *prima gratia*, nor *meritum de congruo* (by natural ability). After thus stating the principles of morality, in *the secunda secundoe* Thomas comes to a minute exposition of his ethics according to the scheme of the virtues. The conceptions of faith and love are of mush significance in the complete system of Thomas. Man strives toward the highest good with the will or through love. But since the end must first be " apprehended in the intellect," knowledge of the end to be loved must precede love; " because the will can not strive after God in perfect love unless the intellect have true faith toward him." Inasmuch as this truth which is to be known is practical it first incites the will, which then brings the reason to " assent." But since, furthermore, the good in question is transcendent and inaccessible to man by himself, it requires the infusion of a supernatural " capacity " or " disposition " to make man capable of faith as well as love. Accordingly the object of both faith and love is God, involving also the entire complex of truths and commandments which God reveals, in so far as they in fact relate to God and lead to him. Thus faith becomes recognition of the teachings and precepts of the Scriptures and the Church (" the first subjection of man to God is by faith"). The object of faith comes to completion only in love ("by love is the act of faith accomplished and formed")

THE SUMMA PART III: CHRIST. The way which leads to God is Christ: and Christ is the theme of part iii. It can not be asserted that the incarnation was absolutely necessary, "since God in his omnipotent power could have repaired human nature in many other ways": but it was the most suitable way both for the purpose of instruction and of satisfaction. The *Unio* between the Logos and the human nature is a " relation " between the divine and the human nature which comes about by both natures being brought together in the one person of the Logos. An incarnation can be spoken of only in the sense that the human nature began to be in the eternal hypostasis of the divine nature. So Christ is *unum* since his human nature lacks the hypostasis. The person of the Logos, accordingly, has assumed the impersonal human nature, and in such way that the assumption of the soul became the means for the assumption of the body. This union with the human soul is the *gratia unionis* which leads to the impartation of the *gratia habitualis* from the Logos to the human nature. Thereby all human potentialities are made perfect in Jesus. Besides the perfections given by the vision of God, which Jesus enjoyed from the beginning, he receives all others by the *gratia habitualis*. In so far, however, as it is the limited human nature which receives these perfections, they are finite. This holds both of the knowledge and the will of Christ. The Logos impresses the *species intelligibiles* of all created things on the soul, but the *intellectus agens* transforms them gradually into the impressions of sense. On another side the soul of Christ works miracles only as instrument of the Logos, since omnipotence in no way appertains to this human soul in itself. Furthermore, Christ's human nature partook of imperfections, on the one side to make his true humanity evident, on another side because he would bear the general consequences of sin for humanity. Christ experienced suffering, but blessedness reigned in his soul, which, however, did not extend to his body. Concerning redemption, Thomas teaches that Christ is to be regarded as redeemer after his human nature but in such way that the human nature produces divine effects as organ of divinity. The one side of the work of redemption consists herein, that Christ as head of humanity imparts perfection and virtue to his members. He is the teacher and example of humanity; his whole life and suffering as well as his work after he is exalted serve this end. The love wrought hereby in men effects, according to Luke vii. 47, the forgiveness of sins.

This is the first course of thought., Then follows a second complex of thoughts which has the idea of satisfaction as its center. To be sure, God as the highest being could forgive sins without

satisfaction; but because his justice and mercy could be best revealed through satisfaction he chose this way. As little, however, as satisfaction is necessary in itself, so little does it offer an equivalent, in a correct sense, for guilt; it is rather a " super-abundant satisfaction," since on account of the divine subject in Christ in a certain sense his suffering and activity are infinite. With this thought the strict logical deduction of Anselm's theory is given up. Christ's suffering bore personal character in that it proceeded out of love and obedience." It was an offering brought to God, which as personal act had the character of merit. Thereby Christ " merited " salvation for men. As Christ, exalted, still influences men, so does he still work in their behalf continually in heaven through the intercession (*interpellatio*). In this way Christ as head of humanity effects the forgiveness of their sins, their reconciliation with God, their immunity from punishment, deliverance from the devil, and the opening of heaven's gate. But inasmuch as all these benefits are already offered through the inner operation of the love of Christ, Thomas has combined the theories of Anselm and Abelard by joining the one to the other.

THE SACRAMENTS. The doctrine of the sacraments follows the Christology; for the sacraments " have efficacy from the incarnate Word himself." The sacraments are signs, which, however, not only signify sanctification but also effect it. That they bring spiritual gifts in sensuous form, moreover, is inevitable because of the sensuous nature of man. The *res sensibles* are the matter, the words of institution the form of the *sacranieits*. Contrary to the Franciscan view that the sacraments are mere symbol, whose efficacy God accompanies with a directly following creative act in the soul, Thomas holds it not unfit to say with Hugo of St. Victor that "a sacrament contains grace," or to teach of the sacraments that they "cause grace." The difficulty of a sensuous thing producing a creative effect, Thomas attempts to remove by a distinction between the causa principalis et instrumentalism God as the principal cause works through the sensuous thing as the means ordained by him for his end. "Just as instrumental power is acquired by the instrument from this, that it is moved by the principal agent, so also the sacrament obtains spiritual Power from the benediction of Christ and the application of the minister to the use of the sacrament. There is spiritual power in the sacraments in so far as they have been ordained by God for a spiritual effect." And this spiritual power remains in the sensuous thing until it has attained its purpose. At the same time Thomas distinguished the *gratia sacramentalis* from the *gratia virtutum et donorum,* in that the former in general perfects the essence and the powers of the soul, and the latter in particular brings to pass necessary spiritual effects for the Christian life. Later this distinction was ignored. In a single statement the effect of the sacraments is to infuse justifying grace into men. What Christ effects is achieved through the sacraments. Christ's humanity was the instrument for the operation of his divinity; the sacraments are the instruments through which this operation of Christ's humanity passes over to men. Christ's humanity served his divinity as *instrumentum conjuncture,* like the hand: the sacraments are instruments separate, like a staff; the former can use the latter, as the hand can use a staff. Of Thomas' eschatology, according to the commentary on the " Sentences," only a brief account can here be given. Everlasting blessedness consists for Thomas in the vision of God: and this vision consists not in an abstraction or in a mental image supernatural produced, but the divine substance itself is beheld, and in such manner that God himself becomes immediately the form of the beholding intellect; that is, God is the object of the vision and at the same time causes the vision. The perfection of the blessed also demands that the body be restored to the soul as something to be made perfect by it. Since blessedness consist in Operation it is made more perfect in that the soul has a definite *opcralio* with the body, although the peculiar act of blessedness (i.e., the vision of God) has nothing to do with the body.

Aristotle (384-322 BCE.)

Life. **Aristotle was born in 384 BCE. at Stagirus, a Greek colony and seaport on the coast of Thrace. His father Nichomachus was court physician to King Amyntas of Macedonia, and from this began Aristotle's long association with the Macedonian Court, which considerably influenced his life. While he was still a boy his father died. At age 17 his guardian, Proxenus, sent him to Athens, the intellectual center of the world, to complete his education. He joined the Academy and studied under Plato, attending his lectures for a period of twenty years. In the later years of his association with Plato and the Academy he began to lecture on his own account, especially on the subject of rhetoric. At the death of Plato in 347, the pre-eminent ability of Aristotle would seem to have designated him to succeed to the leadership of the Academy. But his divergence from Plato's teaching was too great to make this possible, and Plato's nephew Speusippus was chosen instead. At the invitation of his friend Hermeas, ruler of Atarneus and Assos in Mysia, Aristotle left for his court. He stayed three year and, while there, married Pythias, the niece of the King. In later life he was married a second time to a woman named Herpyllis, who bore him a son, Nichomachus. At the end of three years Hermeas was overtaken by the Persians, and Aristotle went to Mytilene. At the invitation of Philip of Macedonia he became the tutor of his 13 year old son Alexander (later world conqueror); he did this for the next five years. Both Philip and Alexander appear to have paid Aristotle high honor, and there were stories that Aristotle was supplied by the Macedonian court, not only with funds for teaching, but also with thousands of slaves to collect specimens for his studies in natural science. These stories are probably false and certainly exaggerated.**

Upon the death of Philip, Alexander succeeded to the kingship and prepared for his subsequent conquests. Aristotle's work being finished, he returned to Athens, which he had not visited since the death of Plato. He found the Platonic school flourishing under Xenocrates, and Platonism the dominant philosophy of Athens. He thus set up his own school at a place called the Lyceum. When teaching at the Lyceum, Aristotle had a habit of walking about as he discoursed. It was in connection with this that his followers became known in later years as the *peripatetics*, meaning "to walk about." For the next thirteen years he devoted his energies to his teaching and composing his philosophical treatises. He is said to have given two kinds of lectures: the more detailed discussions in the morning for an inner circle of advanced students, and the popular discourses in the evening for the general body of lovers of knowledge. At the sudden death of Alexander in 323 BCE., the pro-Macedonian government in Athens was overthrown, and a general reaction occurred against anything Macedonian. A charge of impiety was trumped up against him. To escape prosecution he fled to Chalcis in Euboea so that (Aristotle says) "The Athenians might not have another opportunity of sinning against philosophy as they had already done in the person of Socrates." In the first year of his residence at Chalcis he complained of a stomach illness and died in 322 BCE.

Writings. It is reported that Aristotle's writings were held by his student Theophrastus, who had succeeded Aristotle in leadership of the Peripatetic School. Theophrastus's library passed to his pupil Neleus. To protect the books from theft, Neleus's heirs concealed them in a vault, where they were damaged somewhat by dampness, moths and worms. In this hiding place they were discovered about 100 BCE by Apellicon, a rich book lover, and brought to Athens. They were later taken to Rome after the capture of Athens by Sulla in 86 BCE. In Rome they soon attracted the attention of scholars, and the new edition of them gave fresh impetus to the study of Aristotle and of philosophy in general. This collection is the basis of the works of Aristotle that we have today. Strangely, the list of Aristotle's works given by Diogenes Laertius does not contain any of these treatises. It is possible that Diogenes' list is that of forgeries compiled at a time when the real works were lost to sight.

The works of Aristotle fall under three headings: (1) dialogues and other works of a popular character; (2) collections of facts and material from scientific treatment; and (3) systematic works. Among his writings of a popular nature the only one which we possess of any consequence is the interesting tract *On the Polity of the Athenians*. The works on the second group include 200 titles, most in fragments, collected by Aristotle's school and used as research. Some may have been done at the time of Aristotle's successor Theophrastus. Included in this group are constitutions of 158 Greek states. The systematic treatises of the third group are marked by a plainness of style, with none of the golden flow of language which the ancients praised in Aristotle. This may be due to the fact that these works were not, in most cases, published by Aristotle himself or during his lifetime, but were edited after his death from unfinished manuscripts. Until Werner Jaeger (1912) it was assumed that Aristotle's writings presented a systematic account of his views. Jaeger argues for an early, middle and late period (genetic approach), where the early period follows Plato's theory of forms and soul, the middle rejects Plato, and the later period (which includes most of his treatises) is more empirically oriented. Aristotle's systematic treatises may be grouped in several division:

- Logic
    1. Categories (10 classifications of terms)
    2. On Interpretation (propositions, truth, modality)
    3. Prior Analytics (syllogistic logic)
    4. Posterior Analytics (scientific method and syllogism)
    5. Topics (rules for effective arguments and debate)
    6. On Sophistical Refutations (informal fallacies)
- Physical works
    1. Physics (explains change, motion, void, time)
    2. On the Heavens (structure of heaven, earth, elements)
    3. On Generation (through combining material constituents)
    4. Meteorologics (origin of comets, weather, disasters)
- Psychological works
    1. On the Soul (explains faculties, senses, mind, imagination)
    2. On Memory, Reminiscence, Dreams, and Prophesying
- Works on natural history

1. **History of Animals (physical/mental qualities, habits)**
2. **On the parts of Animals**
3. **On the Movement of Animals**
4. **On the Progression of Animals**
5. **On the Generation of Animals**
6. **Minor treatises**
7. **Problems**

- **Philosophical works**
  1. **Metaphysics (substance, cause, form, potentiality)**
  2. **Nicomachean Ethics (soul, happiness, virtue, friendship)**
  3. **Eudemain Ethics**
  4. **Magna Moralia**
  5. **Politics (best states, utopias, constitutions, revolutions)**
  6. **Rhetoric (elements of forensic and political debate)**
  7. **Poetics (tragedy, epic poetry)**

Logic. **Aristotle's writings on the general subject of logic were grouped by the later Peripatetics under the name *Organon,* or instrument. From their perspective, logic and reasoning was the chief preparatory instrument of scientific investigation. Aristotle himself, however, uses the term "logic" as equivalent to verbal reasoning. The *Categories* of Aristotle are classifications of individual words (as opposed to propositions), and include the following ten: substance, quantity, quality, relation, place, time, situation, condition, action, passion. They seem to be arranged according to the order of the questions we would ask in gaining knowledge of an object. For example, we ask, first, what a thing is, then how great it is, next of what kind it is. Substance is always regarded as the most important of these. Substances are further divided into first and second: first substances are *individual* objects; second substances are the *species* in which first substances or individuals inhere.**

Notions when isolated do not in themselves express either truth or falsehood: it is only with the combination of ideas in a proposition that truth and falsity are possible. The elements of such a proposition are the noun substantive and the verb. The combination of words gives rise to rational speech and thought, conveys a meaning both in its parts and as a whole. Such thought may take many forms, but logic considers only *demonstrative* forms which express truth and falsehood. The truth or falsity of propositions is determined by their agreement or disagreement with the facts they represent. Thus propositions are either affirmative or negative, each of which again may be either universal or particular or undesignated. A definition, for Aristotle is a statement of the essential character of a subject, and involves both the genus and the difference. To get at a true definition we must find out those qualities within the genus which taken separately are wider than the subject to be defined, but taken together are precisely equal to it. For example, "prime" "odd" and "number" are each wider than "triplet" (i.e., a collection of any three items, such as three rocks); but taken together they are just equal to it. The genus definition must be formed so that no species is left out. Having determined the genus and species, we must next find the points of similarity in the species separately and then consider the common characteristics of different species. Definitions may be imperfect by (1) being obscure, (2) by being too wide, or (3) by not

stating the essential and fundamental attributes. Obscurity may arise from the use of equivocal expressions, of metaphorical phrases, or of eccentric words. The heart of Aristotle's logic is the syllogism, the classic example of which is as follows: All men are mortal; Socrates is a man; therefore, Socrates is mortal. The syllogistic form of logical argumentation dominated logic for 2,000 years.

Metaphysics. Aristotle's editors gave the name "Metaphysics" to his works on *first philosophy*, either because they went *beyond* or followed *after* his physical investigations. Aristotle begins by sketching the history of philosophy. For Aristotle, philosophy arose historically after basic necessities were secured. It grew out of a feeling of curiosity and wonder, to which religious myth gave only provisional satisfaction. The earliest speculators (i.e. Thales, Anaximenes, Anaximander) were philosophers of nature. The Pythagoreans succeeded these with mathematical abstractions. The level of pure thought was reached partly in the Eleatic philosophers (such as Parmenides) and Anaxagoras, but more completely in the work of Socrates. Socrates' contribution was the expression of general conceptions in the form of definitions, which he arrived at by induction and analogy. For Aristotle, the subject of metaphysics deals with the first principles of scientific knowledge and the ultimate conditions of all existence. More specifically, it deals with existence in its most fundamental state (i.e. being *as* being), and the essential attributes of existence. This can be contrasted with mathematics which deals with existence in terms of lines or angles, and not existence as it is in itself. In its universal character, metaphysics superficially resembles dialectics and sophistry. However, it differs from dialectics which is tentative, and it differs from sophistry which is a pretence of knowledge without the reality.

The axioms of science fall under the consideration of the metaphysician insofar as they are properties of *all* existence. Aristotle argues that there are a handful of universal truths. Against the followers of Heraclitus and Protagoras, Aristotle defends both the laws of contradiction, and that of excluded middle. He does this by showing that their denial is suicidal. Carried out to its logical consequences, the denial of these laws would lead to the sameness of all facts and all assertions. It would also result in an indifference in conduct. As the science of being *as* being, the leading question of Aristotle's metaphysics is, What is meant by the real or true substance? Plato tried to solve the same question by positing a universal and invariable element of knowledge and existence -- the forms -- as the only real permanent besides the changing phenomena of the senses. Aristotle attacks Plato's theory of the forms on three different grounds.

First, Aristotle argues, forms are powerless to explain *changes* of things and a thing's ultimate extinction. Forms are not causes of movement and alteration in the physical objects of sensation. *Second*, forms are equally incompetent to explain how we arrive at *knowledge* of particular things. For, to have knowledge of a particular object, it must be knowledge of the substance which is *in* that things. However, the forms place knowledge outside of particular things. Further, to suppose that we know particular things better by adding on their general conceptions of their forms, is about as absurd as to imagine that we can count numbers better by multiplying them. Finally, if forms were needed to explain our knowledge of particular objects, then forms must be used to explain our knowledge of objects of art; however, Platonists do not recognize such forms. The *third* ground of attack is that the forms simply cannot explain the *existence* of particular objects. Plato contends that forms do not exist *in* the particular objects which partake in the forms. However, that substance of a particular thing cannot be separated from the thing itself. Further, aside from the jargon of "participation," Plato does not explain the relation between forms and particular

things. In reality, it is merely metaphorical to describe the forms as patterns of things; for, what is a genus to one object is a species to a higher class, the same idea will have to be both a form and a particular thing at the same time. Finally, on Plato's account of the forms, we must imagine an intermediate link between the form and the particular object, and so on *ad infinitum*: there must always be a "third man" between the individual man and the form of man.

For Aristotle, the form is not something outside the object, but rather *in* the varied phenomena of sense. Real substance, or true being, is not the abstract form, but rather the *concrete* individual thing. Unfortunately, Aristotle's theory of substance is not altogether consistent with itself. In the *Categories* the notion of substance tends to be nominalistic (i.e., substance is a concept we apply to things). In the *Metaphysics*, though, it frequently inclines towards realism (i.e., substance has a real existence in itself). We are also struck by the apparent contradiction in his claims that science deals with universal concepts, and substance is declared to be an individual. In any case, substance is for him a merging of matter into form. The term "matter" is used by Aristotle in four overlapping senses. *First*, it is the underlying structure of changes, particularly changes of growth and of decay. *Secondly*, it is the potential which has implicitly the capacity to develop into reality. *Thirdly*, it is a kind of stuff without specific qualities and so is indeterminate and contingent. *Fourthly*, it is identical with form when it takes on a form in its actualized and final phase.

The development of potentiality to actuality is one of the most important aspects of Aristotle's philosophy. It was intended to solve the difficulties which earlier thinkers had raised with reference to the beginnings of existence and the relations of the one and many. The actual vs. potential state of things is explained in terms of the causes which act on things. There are four causes:

1. **Material cause, or the elements *out of which* an object is created;**
2. **Efficient cause, or the means *by which* it is created;**
3. **Formal cause, or the expression of *what* it is;**
4. **Final cause, or the end *for which* it is.**

Take, for example, a bronze statue. Its material cause is the bronze itself. Its efficient cause is the sculptor, insofar has he forces the bronze into shape. The formal cause is the idea of the completed statue. The final cause is the idea of the statue as it *prompts* the sculptor to act on the bronze. The final cause tends to be the same as the formal cause, and both of these can be subsumed by the efficient cause. Of the four, it is the formal and final which is the most important, and which most truly gives the explanation of an object. The final end (purpose, or teleology) of a thing is realized in the full perfection of the object itself, not in our conception of it. Final cause is thus internal to the nature of the object itself, and not something we subjectively impose on it.

God to Aristotle is the first of all substances, the necessary first source of movement who is himself unmoved. God is a being with everlasting life, and perfect blessedness, engaged in never-ending contemplation.

Philosophy of Nature.

Aristotle sees the universe as a scale lying between the two extremes: form without matter is on one end, and matter without form is on the other end. The passage of matter into form must be shown in its various stages in the world of nature. To do this is the object of Aristotle's physics, or philosophy of nature. It is important to keep in mind that the passage from form to matter within nature is a movement towards ends or purposes. Everything in nature

has its end and function, and nothing is without its purpose. Everywhere we find evidences of design and rational plan. No doctrine of physics can ignore the fundamental notions of motion, space, and time. Motion is the passage of matter into form, and it is of four kinds: (1) motion which affects the substance of a thing, particularly its beginning and its ending; (2) motion which brings about changes in quality; (3) motion which brings about changes in quantity, by increasing it and decreasing it; and (4) motion which brings about locomotion, or change of place. Of these the last is the most fundamental and important.

Aristotle rejects the definition of space as the void. Empty space is an impossibility. Hence, too, he disagrees with the view of Plato and the Pythagoreans that the elements are composed of geometrical figures. Space is defined as the limit of the surrounding body towards what is surrounded. Time is defined as the measure of motion in regard to what is earlier and later. it thus depends for its existence upon motion. If there where no change in the universe, there would be no time. Since it is the measuring or counting of motion, it also depends for its existence on a counting mind. If there were no mind to count, there could be no time. As to the infinite divisibility of space and time, and the paradoxes proposed by Zeno, Aristotle argues that space and time are potentially divisible *ad infinitum*, but are not actually so divided.

After these preliminaries, Aristotle passes to the main subject of physics, the scale of being. The first thing to notice about this scale is that it is a scale of values. What is higher on the scale of being is of more worth, because the principle of form is more advanced in it. Species on this scale are eternally fixed in their place, and cannot evolve over time. The higher items on the scale are also more organized. Further, the lower items are inorganic and the higher are organic. The principle which gives internal organization to the higher or organic items on the scale of being is life, or what he calls the soul of the organism. Even the human soul is nothing but the organization of the body. Plants are the lowest forms of life on the scale, and their souls contain a nutritive element by which it preserves itself. Animals are above plants on the scale, and their souls contain an appetitive feature which allows them to have sensations, desires, and thus gives them the ability to move. The scale of being proceeds from animals to humans. The human soul shares the nutritive element with plants, and the appetitive element with animals, but also has a rational element which is distinctively our own. The details of the appetitive and rational aspects of the soul are described in the following two sections.

The Soul and Psychology.

***Soul* is defined by Aristotle as the perfect expression or realization of a natural body. From this definition it follows that there is a close connection between psychological states, and physiological processes. Body and soul are unified in the same way that wax and an impression stamped on it are unified. Metaphysicians before Aristotle discussed the soul abstractly without any regard to the bodily environment; this, Aristotle believes, was a mistake. At the same time, Aristotle regards the soul or mind not as the product of the physiological conditions of the body, but as the *truth* of the body -- the substance in which only the bodily conditions gain their real meaning.**

The soul manifests its activity in certain "faculties" or "parts" which correspond with the stages of biological development, and are the faculties of nutrition (peculiar to plants), that of movement (peculiar to animals), and that of reason (peculiar to humans). These faculties resemble mathematical figures in which the higher includes the lower, and must be understood not as like actual physical parts, but like such *aspects* as convex and concave which we distinguish in the same line. The mind remains throughout a unity: and it is absurd to speak of it, as Plato did, as desiring

with one part and feeling anger with another. Sense perception is a faculty of receiving the forms of outward objects independently of the matter of which they are composed, just as the wax takes on the figure of the seal without the gold or other metal of which the seal is composed. As the subject of impression, perception involves a movement and a kind of qualitative change; but perception is not merely a passive or receptive affection. It in turn acts, and, *distinguishing* between the qualities of outward things, becomes "a movement of the soul through the medium of the body."

The objects of the senses may be either (1) special, (such as color is the special object of sight, and sound of hearing), (2) common, or apprehended by several senses in combination (such as motion or figure), or (3) incidental or inferential (such as when from the immediate sensation of white we come to know a person or *object* which is white). There are five special senses. Of these, touch is the must rudimentary, hearing the most instructive, and sight the most ennobling. The organ in these senses never acts directly , but is affected by some medium such as air. Even touch, which seems to act by actual contact, probably involves some vehicle of communication. For Aristotle, the heart is the common or central sense organ. It recognizes the common qualities which are involved in all particular objects of sensation. It is, first, the sense which brings us a consciousness of sensation. Secondly, in one act before the mind, it holds up the objects of our knowledge and enables us to distinguish between the reports of different senses.

Aristotle defines the imagination as "the movement which results upon an actual sensation." In other words, it is the process by which an impression of the senses is pictured and retained before the mind, and is accordingly the basis of memory. The representative pictures which it provides form the materials of reason. Illusions and dreams are both alike due to an excitement in the organ of sense similar to that which would be caused by the actual presence of the sensible phenomenon. Memory is defined as the permanent possession of the sensuous picture as a copy which represents the object of which it is a picture. Recollection, or the calling back to mind the residue of memory, depends on the laws which regulate the association of our ideas. We trace the associations by starting with the thought of the object present to us, then considering what is similar, contrary or contiguous.

Reason is the source of the first principles of knowledge. Reason is opposed to the sense insofar as sensations are restricted and individual, and thought is free and universal. Also, while the senses deals with the concrete and material aspect of phenomena, reason deals with the abstract and ideal aspects. But while reason is in itself the source of general ideas, it is so only potentially. For, it arrives at them only by a process of development in which it gradually clothes sense in thought, and unifies and interprets sense-presentations. This work of reason in thinking beings suggests the question: How can immaterial thought come to receive material things? It is only possible in virtue of some *community* between thought and things. Aristotle recognizes an active reason which *makes* objects of thought. This is distinguished from passive reason which receives, combines and compares the objects of thought. Active reason makes the world intelligible, and bestows on the materials of knowledge those ideas or categories which make them accessible to thought. This is just as the sun communicates to material objects that light, without which color would be invisible, and sight would have no object. Hence reason is the constant support of an intelligible world. While assigning reason to the soul of humans, Aristotle describes it as coming from without, and almost seems to identify it with God as the eternal and omnipresent thinker. Even in humans, in short, reason realizes something of the essential characteristic of absolute thought -- the unity of thought as subject with thought as object.

Ethics. **Ethics, as viewed by Aristotle, is an attempt to find out our chief end or highest good: an end which he maintains is really final. Though many ends of life are only means to further ends, our aspirations and desires must have some final object or pursuit. Such a chief end is universally called happiness. But people mean such different things by the expression that he finds it necessary to discuss the nature of it for himself. For starters, happiness must be based on human nature, and must begin from the facts of personal experience. Thus, happiness cannot be found in any abstract or ideal notion, like Plato's self-existing good. It must be something practical an human. It must then be found in the work and life which is unique to humans. But this is neither the vegetative life we share with plants nor the sensitive existence which we share with animals. It follows therefore that true happiness lies in the active life of a rational being or in a perfect realization and outworking of the true soul and self, continued throughout a lifetime.**

Aristotle expands his notion of happiness through an analysis of the human soul which structures and animates a living human organism. The parts of the soul are divided as follows:

	Calculative -- Intellectual Virtue
Rational	
	Appetitive -- Moral Virtue
Irrational	
	Vegetative -- Nutritional Virtue

The human soul has an irrational element which is shared with the animals, and a rational element which is distinctly human. The most primitive irrational element is the vegetative faculty which is responsible for nutrition and growth. An organism which does this well may be said to have a nutritional virtue. The second tier of the soul is the appetitive faculty which is responsible for our emotions and desires (such as joy, grief, hope and fear). This faculty is both rational and irrational. It is irrational since even animals experience desires. However, it is also rational since humans have the distinct ability to control these desires with the help of reason. The human ability to properly control these desires is called moral virtue, and is the focus of morality. Aristotle notes that there is a purely rational part of the soul, the calculative, which is responsible for the human ability to contemplate, reason logically, and formulate scientific principles. The mastery of these abilities is called intellectual virtue.

Aristotle continues by making several general points about the nature of moral virtues (i.e. desire-regulating virtues). First, he argues that the ability to regulate our desires is not instinctive, but learned and is the outcome of both teaching and practice. Second, he notes that if we regulate our desires either too much or too little, then we create problems. As an analogy, Aristotle comments that, either "excess or deficiency of gymnastic exercise is fatal to strength." Third, he argues that desire-regulating virtues are character traits, and are not to be understood as either emotions or mental faculties.

The core of Aristotle's account of moral virtue is his doctrine of the mean. According to this doctrine, moral virtues are desire-regulating character traits which are at a mean between more extreme character traits (or vices). For example, in response to the natural emotion of fear, we should develop the virtuous character trait of courage. If we develop an excessive character trait by curbing fear too much, then we are said to be rash, which is a vice. If, on the other extreme, we develop a deficient character trait by curbing fear too little, then we are said to be cowardly, which

is also a vice. The virtue of courage, then, lies at the mean between the excessive extreme of rashness, and the deficient extreme of cowardice. Aristotle is quick to point out that the virtuous mean is not a strict mathematical mean between two extremes. For example, if eating 100 apples is too many, and eating zero apples is too little, this does not imply that we should eat 50 apples, which is the mathematical mean. Instead, the mean is rationally determined, based on the relative merits of the situation. That is, it is "as a prudent man would determine it." He concludes that it is difficult to live the virtuous life primarily because it is often difficult to find the mean between the extremes.

Most moral virtues, and not just courage, are to be understood as falling at the mean between two accompanying vices. His list may be represented by the following table:

Vice of Deficiency	Virtuous Mean	Vice of Excess
Cowardice	Courage	Rashness
Insensibility	Temperance	Intemperance
Illiberality	Liberality	Prodigality
Pettiness	Munificence	Vulgarity
Humble-mindedness	High-mindedness	Vaingloriness
Want of Ambition	Right Ambition	Over-ambition
Spiritlessness	Good Temper	Irascibility
Surliness	Friendly Civility	Obsequiousness
Ironical Depreciation	Sincerity	Boastfulness
Boorishness	Wittiness	Buffoonery
Shamelessness	Modesty	Bashfulness
Callousness	Just Resentment	Spitefulness

The prominent virtue of this list is high-mindedness, which, as being a kind of ideal self-respect, is regarded as the crown of all the other virtues, depending on them for its existence, and itself in turn tending to intensify their force. The list seems to be more a deduction from the formula than a statement of the facts on which the formula itself depends, and Aristotle accordingly finds language frequently inadequate to express the states of excess or defect which his theory involves (for example in dealing with the virtue of ambition). Throughout the list he insists on the "autonomy of will" as indispensable to virtue: courage for instance is only really worthy of the name when done from a love of honor and duty: munificence again becomes vulgarity when it is not exercised from a love of what is right and beautiful, but for displaying wealth.

Justice is used both in a general and in a special sense. In its general sense it is equivalent to the observance of law. As such it is the same thing as virtue, differing only insofar as virtue exercises the disposition simply in the abstract, and justice applies it in dealings with people. Particular justice displays itself in two forms. First, *distributive justice* hands out honors and rewards according to the merits of the recipients. Second, *corrective justice* takes no account of the position of the parties concerned, but simply secures equality between the two by taking away from the advantage of the one and adding it to the disadvantage of the other. Strictly speaking, distributive and corrective justice are more than mere retaliation and reciprocity. However, in concrete situations of civil life, retaliation and reciprocity is an adequate formula since such circumstances

involve money, depending on a relation between producer and consumer. Since absolute justice is abstract in nature, in the real world it must be supplemented with equity, which corrects and modifies the laws of justice where it falls short. Thus, morality requires a standard which will not only regulate the inadequacies of absolute justice but be also an idea of moral progress.

This idea of morality is given by the faculty of moral insight. The truly good person is at the same time a person of perfect insight, and a person of perfect insight is also perfectly good. Our idea of the ultimate end of moral action is developed through habitual experience, and this gradually frames itself out of particular perceptions. It is the job of reason to apprehend and organize these particular perceptions. However, moral action is never the result of a mere act of the understanding, nor is it the result of a simple desire which views objects merely as things which produce pain or pleasure. We start with a rational conception of what is advantageous, but this conception is in itself powerless without the natural impulse which will give it strength. The will or purpose implied by morality is thus either reason stimulated to act by desire, or desire guided and controlled by understanding. These factors then motivate the willful action. Freedom of the will is a factor with both virtuous choices and vicious choices. Actions are involuntary only when another person forces our action, or if we are ignorant of important details in actions. Actions are voluntary when the originating cause of action (either virtuous or vicious) lies in ourselves.

Moral weakness of the will results in someone does what is wrong, knowing that it is right, and yet follows his desire against reason. For Aristotle, this condition is not a myth, as Socrates supposed it was. The problem is a matter of conflicting moral principles. Moral action may be represented as a syllogism in which a general principle of morality forms the first (i.e. major) premise, while the particular application is the second (i.e. minor) premise. The conclusion, though, which is arrived at through speculation, is not always carried out in practice. The moral syllogism is not simply a matter of logic, but involves psychological drives and desires. Desires can lead to a minor premise being applied to one rather than another of two major premises existing in the agent's mind. Animals, on the other hand, cannot be called weak willed or incontinent since such a conflict of principles is not possible with them.

Pleasure is not to be identified with Good. Pleasure is found in the consciousness of free spontaneous action. It is an invisible experience, like vision, and is always present when a perfect organ acts upon a perfect object. Pleasures accordingly differ in kind, varying along with the different value of the functions of which they are the expression. They are determined ultimately by the judgment of "the good person." Our chief end is the perfect development of our true nature; it thus must be particularly found in the realization of our highest faculty, that is, reason. It is this in fact which constitutes our personality, and we would not be pursuing our own life, but the life of some lower being, if we followed any other aim. Self-love accordingly may be said to be the highest law of morals, because while such self-love may be understood as the selfishness which gratifies a person's lower nature, it may also be, and is rightly, the love of that higher and rational nature which constitutes each person's true self. Such a life of thought is further recommended as that which is most pleasant, most self-sufficient, most continuous, and most consonant with our purpose. It is also that which is most akin to the life of God: for God cannot be conceived as practising the ordinary moral virtues and must therefore find his happiness in contemplation.

Friendship is an indispensable aid in framing for ourselves the higher moral life; if not itself a virtue, it is at least associated with virtue, and it proves itself of service in almost all conditions of our existence. Such results, however, are to be derived not from the worldly friendships of utility or pleasure, but only from those which are founded on virtue. The true friend is in fact a second

self, and the true moral value of friendship lies in the fact that the friend presents to us a mirror of good actions, and so intensifies our consciousness and our appreciation of life.

Politics. **Aristotle does not regard politics as a separate science from ethics, but as the completion, and almost a verification of it. The moral ideal in political administration is only a different aspect of that which also applies to individual happiness. Humans are by nature social beings, and the possession of rational speech (logos) in itself leads us to social union. The state is a development from the family through the village community, an offshoot of the family. Formed originally for the satisfaction of natural wants, it exists afterwards for moral ends and for the promotion of the higher life. The state in fact is no mere local union for the prevention of wrong doing, and the convenience of exchange. It is also no mere institution for the protection of goods and property. It is a genuine moral organization for advancing the development of humans.**

The family, which is chronologically prior to the state, involves a series of relations between husband and wife, parent and child, master and slave. Aristotle regards the slave as a piece of live property having no existence except in relation to his master. Slavery is a natural institution because there is a ruling and a subject class among people related to each other as soul to body; however, we must distinguish between those who are slaves by nature, and those who have become slaves merely by war and conquest. Household management involves the acquisition of riches, but must be distinguished from money-making for its own sake. Wealth is everything whose value can be measured by money; but it is the use rather than the possession of commodities which constitutes riches.

Financial exchange first involved bartering. However, with the difficulties of transmission between countries widely separated from each other, money as a currency arose. At first it was merely a specific amount of weighted or measured metal. Afterwards it received a stamp to mark the amount. Demand is the real standard of value. Currency, therefore, is merely a convention which represents the demand; it stands between the producer and the recipient and secures fairness. Usury is an unnatural and reprehensible use of money.

The communal ownership of wives and property as sketched by Plato in the *Republic* rests on a false conception of political society. For, the state is not a homogeneous unity, as Plato believed, but rather is made up of dissimilar elements. The classification of constitutions is based on the fact that government may be exercised either for the good of the governed or of the governing, and may be either concentrated in one person or shared by a few or by the many. There are thus three true forms of government: monarchy, aristocracy, and constitutional republic. The perverted forms of these are tyranny, oligarchy and democracy. The difference between the last two is not that democracy is a government of the many, and oligarchy of the few; instead, democracy is the state of the poor, and oligarchy of the rich. Considered in the abstract, these six states stand in the following order of preference: monarchy, aristocracy, constitutional republic, democracy, oligarchy, tyranny. But though with a perfect person monarchy would be the highest form of government, the absence of such people puts it practically out of consideration. Similarly, true aristocracy is hardly ever found in its uncorrupted form. It is in the constitution that the good person and the good citizen coincide. Ideal preferences aside, then, the constitutional republic is regarded as the best *attainable* form of government, especially as it secures that predominance of a large middle class, which is the chief basis of permanence in any state. With the spread of population, democracy is likely to become the general form of government.

Which is the best state is a question that cannot be directly answered. Different races are suited for different forms of government, and the question which meets the politician is not so much what is abstractly the best state, but what is the best state under existing circumstances. Generally, however, the best state will enable anyone to act in the best and live in the happiest manner. To serve this end the ideal state should be neither too great nor too small, but simply self-sufficient. It should occupy a favorable position towards land and sea and consist of citizens gifted with the spirit of the northern nations, and the intelligence of the Asiatic nations. It should further take particular care to exclude from government all those engaged in trade and commerce; "the best state will not make the "working man" a citizen; it should provide support religious worship; it should secure morality through the educational influences of law and early training. Law, for Aristotle, is the outward expression of the moral ideal without the bias of human feeling. It is thus no mere agreement or convention, but a moral force coextensive with all virtue. Since it is universal in its character, it requires modification and adaptation to particular circumstances through equity.

Education should be guided by legislation to make it correspond with the results of psychological analysis, and follow the gradual development of the bodily and mental faculties. Children should during their earliest years be carefully protected from all injurious associations, and be introduced to such amusements as will prepare them for the serious duties of life. Their literary education should begin in their seventh year, and continue to their twenty-first year. This period is divided into two courses of training, one from age seven to puberty, and the other from puberty to age twenty-one. Such education should not be left to private enterprise, but should be undertaken by the state. There are four main branches of education: reading and writing, Gymnastics, music, and painting. They should not be studied to achieve a specific aim, but in the liberal spirit which creates true freemen. Thus, for example, gymnastics should not be pursued by itself exclusively, or it will result in a harsh savage type of character. Painting must not be studied merely to prevent people from being cheated in pictures, but to make them attend to physical beauty. Music must not be studied merely for amusement, but for the moral influence which it exerts on the feelings. Indeed all true education is, as Plato saw, a training of our sympathies so that we may love and hate in a right manner.

Art. **Art is defined by Aristotle as the realization in external form of a true idea, and is traced back to that natural love of imitation which characterizes humans, and to the pleasure which we feel in recognizing likenesses. Art however is not limited to mere copying. It idealizes nature and completes its deficiencies: it seeks to grasp the universal type in the individual phenomenon. The distinction therefore between poetic art and history is not that the one uses meter, and the other does not. The distinction is that while history is limited to what has actually happened, poetry depicts things in their universal character. And, therefore, "poetry is more philosophical and more elevated than history." Such imitation may represent people either as better or as worse than people usually are, or it may neither go beyond nor fall below the average standard. Comedy is the imitation of the worse examples of humanity, understood however not in the sense of absolute badness, but only in so far as what is low and ignoble enters into what is laughable and comic.**

Tragedy, on the other hand, is the representation of a serious or meaningful, rounded or finished, and more or less extended or far-reaching action -- a representation which is effected by action and not mere narration. It is fitted by portraying events which excite fear and pity in the mind of the observer to purify or purge these feelings and extend and regulate their sympathy. It is thus a

homeopathic curing of the passions. Insofar as art in general universalizes particular events, tragedy, in depicting passionate and critical situations, takes the observer outside the selfish and individual standpoint, and views them in connection with the general lot of human beings. This is similar to Aristotle's explanation of the use of orgiastic music in the worship of Bacchas and other deities: it affords an outlet for religious fervor and thus steadies one's religious sentiments.

Aristotle on Motion and its Place in Nature

INTRODUCTION

Aristotle defines motion, by which he means change of any kind, as the actuality of a potentiality as such (or as movable, or as a potentiality - *Physics* 201a 10-11, 27-29, b 4-5.) The definition is a conjunction of two terms which normally contradict each other, along with, in Greek, a qualifying clause which seems to make the contradiction inescapable. Yet St. Thomas Aquinas called it the only possible way to define motion by what is prior to and better known than motion. At the opposite extreme is the young Descartes, who in the first book he wrote announced that while everyone knows what motion is, no one understands Aristotle's definition of it. According to Descartes, "motion . . . is nothing more than the action by which any body passes from one place to another" (Principles II, 24). The use of the word "passes" makes this definition an obvious circle; Descartes might just as well have called motion the action by which a thing moves. But the important part of Descartes' definition is the words "nothing more than," by which he asserts that motion is susceptible of no definition which is not circular, as one might say "the color red is just the color red," to mean that the term is not reducible to some modification of a wave, or analyzable in any other way. There must be ultimate terms of discourse, or there would be no definitions, and indeed no thought. The point is not that one cannot construct a non-circular definition of such a term, one claimed to be properly irreducible, but that one ought not to do so. The true atoms of discourse are those things which can be explained only by means of things less known than themselves. If motion is such an ultimate term, then to define it by means of anything but synonyms is willfully to choose to dwell in a realm of darkness, at the sacrifice of the understanding which is naturally ours in the form of "good sense" or ordinary common sense.

Descartes' treatment of motion is explicitly anti-Aristotelian and his definition of motion is deliberately circular. The Cartesian physics is rooted in a disagreement with Aristotle about what the best-known things are, and about where thought should take its beginnings. There is, however, a long tradition of interpretation and translation of Aristotle's definition of motion, beginning at least five hundred years before Descartes and dominating discussions of Aristotle today, which seeks to have things both ways. An unusually clear instance of this attitude is found in the following sentence from a medieval Arabic commentary: "Motion is a first entelechy of that which is in potentiality, insofar as it is in potentiality, and if you prefer you may say that it is a transition from potentiality to actuality." You will recognize the first of these two statements presented as equivalent as a translation of Aristotle's definition, and the second as a circular definition of the same type as that of Descartes. Motion is an entelechy; motion is a transition The strangeness of the word "entelechy" masks the contradiction between these two claims. We must achieve an understanding of Aristotle's word *entelecheia*, the heart of his definition of motion, in order to see that what it says cannot be said just as well by such a word as "transition."

ENERGEIA AND *ENTELECHIA*

The word *entelecheia* was invented by Aristotle, but never defined by him. It is at the heart not only of his definition of motion, but of all his thought. Its meaning is the most knowable in itself of all possible objects of the intellect. There is no starting point from which we can descend to put together the cements of its meaning. We can come to an understanding of *entelecheia* only by an ascent from what is intrinsically less knowable than it, indeed knowable only through it, but more known because more familiar to us. We have a number of resources by which to begin such an ascent, drawing upon the linguistic elements out of which Aristotle constructed the word, and upon the fact that he uses the word *energeia* as a synonym, or all but a synonym, for *entelecheia*.

The root of *energeia* is *ergon*—deed, work, or act—from which comes the adjective *energon* used in ordinary speech to mean active, busy, or at work. *Energeia* is formed by the addition of a noun ending to the adjective *energon*; we might construct the word “at-work-ness” from Anglo-Saxon roots to translate *energeia* into English, or use the more euphonious periphrastic expression, “being-at-work.” If we are careful to remember how we got there, we could alternatively use Latin roots to make the word "actuality" to translate *energeia*. The problem with this alternative is that the word "actuality" already belongs to the English language, and has a life of its own which seems to be at variance with the simple sense of being active. By the actuality of a thing, we mean not its being-in-action but its being what it is. For example, I recently saw a picture of a fish with an effective means of camouflage: it looks like a rock but it is *actually* a fish. I don't seem to be talking about any activity when I attribute an actuality to that thing, completely at rest at the bottom of the ocean. But according to Aristotle, to be something always means to be at work in a certain way. In the case of the fish at rest, its actuality is the activity of metabolism, the work by which it is constantly transforming material from its environment into parts of itself and losing material from itself into its environment, the activity by which the fish maintains itself as a fish and as just the fish it is, and which ceases only when the fish ceases to be. Any static state which has any determinate character can only exist as the outcome of a continuous expenditure of effort, maintaining the state as it is. Thus even the rock, at rest next to the fish, is in activity: to be a rock is to strain to be at the center of the universe, and thus to be in motion unless constrained otherwise, as the rock in our example is constrained by the large quantity of earth already gathered around the center of the universe. A rock at rest at the center is at work maintaining its place, against the counter-tendency of all the earth to *dis*place it. The center of the universe is determined only by the common innate activity of rocks and other kinds of earth. Nothing *is* which is not somehow in action, maintaining itself either as the

whole it is, or as a part of some whole. A rock is inorganic only when regarded in isolation from the universe as a whole which is an organized whole just as blood considered by itself could not be called alive yet is only blood insofar as it contributes to the maintenance of some organized body. No existing rock can fail to contribute to the hierarchical organization of the universe; I can therefore call any existing rock an actual rock.

Energeia, then, always means the being-at-work of some definite, specific something; the rock cannot undergo metabolism, and once the fish does no more than fall to earth and remain there it is no longer a fish. The material and organization of a thing determine a specific capacity or potentiality for activity with respect to which the corresponding activity has the character of an end (*telos*). Aristotle says "the act is an end and the being-at-work is the act and since *energeia* is named from the *ergon* it also extends to the being-at-an-end (*entelecheia*)" (*Metaphysics* 1050a 21-23). The word *entelecheia* has a structure parallel to that of *energeia*. From the root word *telos*, meaning end, comes the adjective *enteles*, used in ordinary speech to mean complete, perfect, or full-grown. But while *energeia*, being-at-work, is made from the adjective meaning at work and a noun ending, *entelecheia* is made from the adjective meaning complete and the verb *exein*. Thus if we translate *entelecheia* as "completeness" or "perfection" the contribution the meaning of *exein* makes to the term is not evident. I would suggest that Aristotle uses *exein* for two reasons which lead to the same conclusion: First, one of the common meanings of *exein* is "to be" in the sense of to remain, to stay, or to keep in some condition specified by a preceding adverb as in the idioms *kalos exei*, "things are going well," or *kakos exei*, "things are going badly." It means "to be" in the sense of to continue to be. This is only one of several possible meanings of *exein*, but there is a second fact which makes it likely that it is the meaning which would strike the ear of a Greek-speaking person of Aristotle's time. There was then in ordinary use the word *endelecheia*, differing from Aristotle's word *entelecheia* only by a delta in place of the tau. *Endelecheia* means continuity or persistence. As one would expect, there was a good deal of confusion in ancient times between the invented and undefined term *entelecheia* and the familiar word *endelecheia*. The use of the pun for the serious philosophic purpose of saying at once two things for whose union the language has no word was a frequent literary device of Aristotle's teacher Plato. In this striking instance, Aristotle seems to have imitated the playful style of his teacher in constructing the most important term in his technical vocabulary. The addition of *exein* to *enteles*, through the joint action of the meaning of the suffix and the sound of the whole, superimposes upon the sense of "completeness" that of continuity. *Entelecheia* means continuing in a state of completeness, or being at an end which is of such a nature that it is only possible to be there by means of the continual expenditure of the effort required to stay there. Just as *energeia* extends to *entelecheia* because it is the activity which makes a thing what it is, *entelecheia* extends to *energeia* because it is the end or perfection which has being only in, through, and during activity. For the remainder of this entry, the word "actuality" translates both *energeia* and *entelecheia*, and by actuality I shall mean just that area of overlap between being-at-work and being-at-an-end which expresses what it means to be something determinate. The words *energeia* and *entelecheia* have very different meanings, but function as synonyms because the world is such that things have identities, belong to species, act for ends, and form material into enduring organized wholes. The word actuality as thus used is very close in meaning to the word life, with the exception that it is broader in meaning, carrying no necessary implication of mortality.

THE STANDARD ACCOUNT OF ARISTOTLE'S VIEW OF MOTION

We embarked on this quest for the meaning of *entelecheia* in order to decide whether the phrase "transition to actuality" could ever properly render it. The answer is now obviously "no." An actuality is

something ongoing, but only the ongoing activity of maintaining a state of completeness or perfection already reached; the transition into such a state always lacks and progressively approaches the perfected character which an actuality always has. A dog is not a puppy: the one is, among other things, capable of generating puppies and giving protection, while the other is incapable of generation and in need of protection. We might have trouble deciding exactly when the puppy has ceased to be a puppy and become a dog— at the age of one year, for example, it will probably be fully grown and capable of reproducing, but still awkward in its movements and puppyish in its attitudes—but in any respect in which it has become a dog it has ceased to be a puppy.

But our concern was to understand what motion is, and it is obviously the puppy which is in motion, since it is growing toward maturity, while the dog is not in motion in that respect, since its activity has ceased to produce change and become wholly directed toward self-maintenance. If the same thing cannot be in the same respect both an actuality and a transition to actuality, it is clearly the *transition* that motion is, and the actuality that it isn't. It seems that Descartes is right and Aristotle is wrong. Of course it is possible that Aristotle meant what Descartes said, but simply used the wrong word, that he called motion an *entelecheia* three times, at the beginning, middle, and end of his explanation of what motion is, when he really meant not *entelecheia* but the transition or passage to *entelecheia*. Now, this suggestion would be laughable if it were not what almost everyone who addresses the question today believes. Sir David Ross, certainly the most massively qualified authority on Aristotle of those who have lived in our century and written in our language, the man who supervised the Oxford University Press's forty-five year project of translating all the works of Aristotle into English, in a commentary, on Aristotle's definition of motion, writes: "*entelecheia* must here mean 'actualization,' not 'actuality'; it is the passage to actuality that is *kinesis*" (*Physics, text with commentary*, London, 1936, p. 359). In another book, his commentary on the *Metaphysics*, Ross makes it clear that he regards the meaning *entelecheia* has in every use Aristotle makes of it everywhere *but* in the definition of motion as being not only other than but incompatible with the meaning "actualization." In view of that fact, Ross' decision that "*entelecheia* must here mean 'actualization'" is a desperate one, indicating a despair of understanding Aristotle out of his own mouth. It is not translation or interpretation but plastic surgery.

Ross' full account of motion as actualization (*Aristotle*, New York, 1966, pp. 81-82) cites no passages from Aristotle, and no authorities, but patiently explains that motion is motion and cannot, therefore, be an actuality. There are authorities he could have cited, including Moses Maimonides, the twelfth century Jewish philosopher who sought to reconcile Aristotle's philosophy with the Old Testament and Talmud, and who defined motion as "the transition from potentiality to actuality," and the most famous Aristotelian commentator of all time, Averroes, the twelfth century Spanish Moslem thinker, who called motion a passage from non-being to actuality and complete reality. In each case the circular definition is chosen in preference to the one which seems laden with contradictions. A circular statement, to the extent that it is circular, is at least not false, and can as a whole have some content: Descartes' definition amounts to saying "whatever motion is, it is possible only with respect to place," and that of Averroes, Maimonides, and Ross amounts to saying "whatever motion is, it results always in an actuality." An accurate rendering of Aristotle's definition would amount to saying (a) that motion is rest, and (b) that a potentiality, which must be, at a minimum, a privation of actuality, is at the same time that actuality of which it is the lack. There has been one major commentator on Aristotle who was prepared to take seriously and to make sense of both these claims.

THOMAS' ACCOUNT OF ARISTOTLE'S VIEW OF MOTION

St. Thomas Aquinas, in his interpretation of Aristotle's definition of motion, (*Commentary on Aristotle's Physics*, London, 1963, pp. 136-137), observes two principles: (1) that Aristotle meant what he wrote, and (2) that what Aristotle wrote is worth the effort of understanding. Writing a century after Maimonides and Averroes, Thomas disposes of their approach to defining motion with few words: it is not Aristotle's definition and it is an error. A passage, a transition, an actualization, an actualizing, or any of the more complex substantives to which translators have resorted which incorporate in some more or less disguised form some progressive sense united to the meaning of actuality, all have in common that they denote a kind of motion. *If* motion can be defined, then to rest content with explaining motion as a kind of motion is certainly to err; even if one is to reject Aristotle's definition on fundamental philosophical grounds, as Descartes was to do, the first step must be to see what it means. And Thomas explains clearly and simply a sense in which Aristotle's definition is both free of contradiction and genuinely a definition of motion. One must simply see that the growing puppy *is* a dog, that the half formed lump of bronze on which the sculptor is working *is* a statue of Hermes, that the tepid water on the fire *is* hot; what it *means* to say that the puppy is growing, the bronze is being worked, or the water is being heated, is that each is not just the complex of characteristics it possesses right now; in each case, something that the thing is not yet, already belongs to it as that toward which it is, right now, ordered. To say that something is in motion is just to say that it is *both* what it is already and something else that it isn't yet. What else do we mean by saying that the puppy is growing, rather than remaining what it is, that the bronze under the sculptor's hand is in a different condition from the identically shaped lump of bronze he has discarded, or that the water is not just tepid but being heated? Motion is the mode in which the future belongs to the present, is the present absence of just those particular absent things which are about to be.

Thomas discusses in detail the example of the water being heated. Assume it to have started cold, and to have been heated so far to room temperature. The heat it now has, which has replaced the potentiality it previously had to be just that hot, belongs to it in actuality. The capacity it has to be still hotter belongs to it in potentiality. To the extent that it is actually hot it has been moved; to the extent that it is not yet as hot as it is going to be, it is not yet moved. The motion is just *the joint presence of potentiality and actuality with respect to same thing*, in this case heat.

In Thomas' version of Aristotle's definition one can see the alternative to Descartes' approach to physics. Since Descartes regards motion as ultimate and given, his physics will give no account of motion itself, but describe the transient static configurations through which the moving things pass. By Thomas' account, motion is not ultimate but is a consequence of the way in which present states of things are ordered toward other actualities which do not belong to them. One could build on such an account a physics of forces, that is, of those directed potentialities which cause a thing to move, to pass over from the actuality it possesses to another which it lacks but to which it is ordered. Motion will thus not have to be understood as the mysterious departure of things from rest, which alone can be described, but as the outcome of the action upon one another of divergent and conflicting innate tendencies of things. Rest will be the anomaly, since things will be understood as so constituted by nature as to pass over of themselves into certain states of activity, but states of rest will be explainable as dynamic states of balance among things with opposed tendencies. Leibniz, who criticized Descartes' physics and invented a science of dynamics, explicitly acknowledged his debt to Aristotle (see, e.g., *Specimen Dynamicum*), whose doctrine of *entelecheia* he regarded himself as restoring in a modified form. From Leibniz we derive our current notions of potential and kinetic energy, whose very names, pointing to the actuality which is potential and the actuality which is motion, preserve the Thomistic resolutions of the two

paradoxes in Aristotle's definition of motion.

THE LIMITS OF THOMAS' ACCOUNT

But though the modern science of dynamics can be seen in germ in St. Thomas' discussion of motion, it can be seen also to reveal difficulties in Thomas' conclusions. According to Thomas, actuality and potentiality do not exclude one another but co-exist as motion. To the extent that an actuality is also a potentiality it is a motion, and to the extent that an actuality is a motion it is a potentiality. The two seeming contradictions cancel each other in the dynamic actuality of the present state which is determined by its own future. But are not potential and kinetic energy two different things? The rock which I hold six feet above the ground has been actually moved identically to the rock which I have thrown six feet above the ground, and at that distance each strains identically to fall to earth; but the one is falling and the other isn't. How can the description which is common to both, when one is moving and the other is at rest, be an account of what motion is? It seems that everything which Thomas says about the tepid water which is being heated can be said also of the tepid water which has been removed from the fire. Each is a coincidence of a certain actuality of heat with a further potentiality to the same heat. What does it mean to say that the water on the fire has, right now, an order to further heat which the water off the fire lacks? If we say that the fire is acting on the one and not on the other in such a way as to disturb its present state, we have begged the question and returned to the position of presupposing motion to explain motion. Thomas' account of Aristotle's definition of motion, though immeasurably superior to that of Sir David Ross as interpretation, and far more sophisticated as an approach to and specification of the conditions an account of motion would have to meet, seems ultimately subject to the same circularity. Maimonides, Averroes, and Ross fail to say how motion differs from rest. Thomas fails to say how any given motion differs from a corresponding state of balanced tension, or of strain and constraint.

The strength of Thomas' interpretation of the definition of motion comes from his taking every word seriously. When Ross discusses Aristotle's definition, he gives no indication of why the *he toiouton*, or "insofar as it is such," clause should have been included. By Thomas' account, motion is the actuality of any potentiality which is nevertheless still a potentiality. It is the actuality which has not canceled its corresponding potentiality but exists along with it. Motion then is the actuality of any potentiality insofar as it is still a potentiality. This is the formula which applies equally well to the dynamic state of rest and the dynamic state of motion. We shall try to advance our understanding by being still more careful about the meaning of the pronoun *he*.

Thomas' account of the meaning of Aristotle's definition forces him to construe the grammar of the definition in such a way that the clause introduced by the dative singular feminine relative pronoun *he* has as its antecedent, in two cases, the neuter participle *tou ontos*, and in the third, the neuter substantive adjective *tou dunatou*. It is true that this particular feminine relative pronoun often had an adverbial sense to which its gender was irrelevant, but in the three statements of the definition of motion there is no verb but *estin*. If the clause is understood adverbially, then, the sentence must mean something like: if motion is a potentiality, it is the actuality of a potentiality. Whatever that might mean, it could at any rate not be a definition of motion. Thus the clause must be understood adjectivally, and Thomas must make the relative pronoun dependent upon a word with which it does not agree in gender. He makes the sentence say that motion is the actuality of the potentiality in which there is yet potentiality. Reading the pronoun as dependent upon the feminine noun *entelecheia* with which it does agree, we find the sentence saying that motion is the actuality *as which* it is a potentiality of the potentiality, or the actuality *as* a potentiality

of the potentiality.

FACING THE CONTRADICTIONS OF ARISTOTLE'S ACCOUNT OF MOTION

This reading of the definition implies that potentialities exist in two ways, that it is possible to *be* a potentiality, yet not be an *actual* potentiality. I said at the beginning of this entry that Aristotle's definition of motion was made by putting together two terms, actuality and potentiality, which normally contradict each other. Thomas resolved the contradiction by arguing that in every motion actuality and potentiality are mixed or blended, that the condition of becoming-hot of the water is just the simultaneous presence in the same water of some actuality of heat and some remaining potentiality of heat. I also said earlier that there was a qualifying clause in Aristotle's definition which seemed to intensify, rather than relieve, the contradiction. I was referring to the *he toiouton*, or *he kineton*, or *he dunaton*, which appears in each version of the definition, and which, being as I have claimed grammatically dependent on *entelecheia*, signifies something the very actuality of which is potentiality. The Thomistic blend of actuality and potentiality has the characteristic that, to the extent that it is actual it is not potential and to the extent that it is potential it is not actual; the hotter the water is, the less is it potentially hot, and the cooler it is, the less is it actually, the more potentially, hot.

The most serious defect in Saint Thomas' interpretation of Aristotle's definition is that, like Ross' interpretation, it broadens, dilutes, cheapens, and trivializes the meaning of the word *entelecheia*. An immediate implication of the interpretations of both Thomas and Ross is that whatever happens to be the case right now is an *entelecheia*, as though being at 70 degrees Fahrenheit were an end determined by the nature of water, or as though something which is intrinsically so unstable as the instantaneous position of an arrow in flight deserved to be described by the word which Aristotle everywhere else reserves for complex organized states which persist, which hold out in being against internal and external causes tending to destroy them.

Aristotle's definition of motion applies to any and every motion: the pencil falling to the floor, the white pages in the book turning yellow, the glue in the binding of the book being eaten by insects. Maimonides, Averroes, and Ross, who say that motion is always a transition or passage from potentiality to actuality, must call the being-on-the-floor of the pencil, the being-yellow of the pages, and the crumbled condition of the binding of the book actualities. Thomas, who says that motion is constituted at any moment by the joint presence of actuality and potentiality, is in a still worse position: he must call every position of the pencil on the way to the floor, every color of the pages on the way to being yellow, and every loss of a crumb from the binding an actuality. If these are actualities, then it is no wonder that philosophers such as Descartes rejected Aristotle's account of motion as a useless redundancy, saying no more than that whatever changes, changes into that into which it changes.

We know however that the things Aristotle called *actualities* are limited in number, and constitute the world in its ordered finitude rather than in its random particularity. The actuality of the adult horse is one, although horses are many and all different from each other. Books and pencils are not actualities at all, even though they are organized wholes, since their organizations are products of human art, and they maintain themselves not as books and pencils but only as earth. Even the organized content of a book, such as that of the first three chapters of Book Three of Aristotle's *Physics*, does not exist as an actuality, since it is only the new labor of each new reader that gives being to that content, in this case a very difficult labor. By this strict test, the only actualities in the world, that is, the only things which, by their own innate tendencies, maintain themselves in being as organized wholes, seem to be the animals and

plants, the ever-the-same orbits of the ever-moving planets, and the universe as a whole. But Aristotle has said that every motion is an *entelecheia*; if we choose not to trivialize the meaning of *entelecheia* to make it applicable to motion, we must deepen our understanding of motion to make it applicable to the meaning of *entelecheia*.

WHAT MOTION IS

In the *Metaphysics*, Aristotle argues that if there is a distinction between potentiality and actuality at all, there must be a distinction between two kinds of potentiality. The man with sight, but with his eyes closed, differs from the blind man, although neither is seeing. The first man has the capacity to see, which the second man lacks. There are then potentialities as well as actualities in the world. But when the first man opens his eyes, has he lost the capacity to see? Obviously not; while he is seeing, his capacity to see is no longer merely a potentiality, but is a potentiality which has been put to work. The potentiality to see exists sometimes as active or at-work, and sometimes as inactive or latent. But this example seems to get us no closer to understanding motion, since seeing is just one of those activities which is not a motion. Let us consider, then, a man's capacity to walk across the room. When he is sitting or standing or lying still, his capacity to walk is latent, like the sight of the man with his eyes closed; that capacity nevertheless has real being, distinguishing the man in question from a man who is crippled to the extent of having lost all potentiality to walk. When the man is walking across the room, his capacity to walk has been put to work. But while he is walking, what has happened to his capacity to *be* at the other side of the room, which was also latent before he began to walk? It too is a potentiality which has been put to work by the act of walking. Once he has reached the other side of the room, his potentiality to be there has been actualized in Ross' sense of the term, but while he is walking, his potentiality to be on the other side of the room is not merely latent, and is not yet canceled by, an actuality in the weak sense, the so-called actuality of being on that other side of the room; *while he is walking his potentiality to be on the other side of the room is actual just as a potentiality*. The actuality of the potentiality to be on the other side of the room, as just that potentiality, is nothing more nor less than the walking across the room.

A similar analysis will apply to any motion whatever. The growth of the puppy is not the actualization of its potentiality to be a dog, but the actuality of that potentiality as a potentiality. The falling of the pencil is the actuality of its potentiality to be on the floor, in actuality as just that: as a *potentiality* to be on the floor. In each case the motion is just the potentiality *qua* actual and the actuality *qua* potential. And the sense we thus give to the word *entelecheia* is not at odds with its other uses: a motion is like an animal in that it remains completely and exactly what it is through time. My walking across the room is no more a motion as the last step is being taken than at any earlier point. Every motion is a complex whole, an enduring unity which organizes distinct parts, such as the various positions through which the falling pencil passes. As parts of the motion of the pencil, these positions, though distinct, function identically in the ordered continuity determined by the potentiality of the pencil to be on the floor. Things have being to the extent that they are or are part of determinate wholes, so that to be means to be something, and change has being because it always is or is part of some determinate potentiality, at work and manifest in the world as change.

ZENO’S PARADOXES AND ARISTOTLE’S DEFINITION OF MOTION

I shall close be considering the application of Aristotle's account of motion to two paradoxes famous in antiquity. Zeno argued in various ways that there is no motion. According to one of his arguments, the arrow in flight is always in some one place, therefore always at rest, and therefore never in motion. We

can deduce from Aristotle's definition that Zeno has made the same error, technically called the fallacy of composition, as one who would argue that no animal is alive since its head, when cut off, is not alive, its blood, when drawn out, is not alive, its bones, when removed are not alive, and so on with each part in turn. The second paradox is one attributed to Heracleitus, and taken as proving that there is nothing but motion, that is, no identity, in the world. The saying goes that one cannot step into the same river twice. If the river flows, how can it continue to be itself? But the flux of the river, like the flight of the arrow, is an actuality of just the kind Aristotle formulates in his definition of motion. The river is always the same, *as a river*, precisely because it is never the same as water. To be a river is to be the always identical actuality of the potentiality of water to be in the sea.

[Contributor's note: This entry is the text of a talk given in 1975. After it was published, I learned of an article by L. A. Kosman, "Aristotle’s Definition of Motion," published in 1969 in the journal *Phronesis*. Kosman interprets the definition in substantially the same way, utilizing examples of kinds of *entelecheia* given by Aristotle in *On the Soul*, and thus succeeds in bypassing the inadequate translations of the word. In 1995 Rutgers University Press published my translation of Aristotle's *Physics*, in which *entelecheia* is most often translated as being-at-work-staying-itself. -JS]

Artificial Intelligence

As a theory in the philosophy of mind, artificial intelligence (or AI) is the view that human cognitive mental states can be duplicated in computing machinery. Accordingly, an intelligent system is nothing but an information processing system. Discussions of AI commonly draw a distinction between weak and strong AI. Weak AI holds that suitably programmed machines can simulate human cognition. Strong AI, by contrast, maintains that suitably programmed machines are capable of cognitive mental states. The weak claim is unproblematic, since a machine which merely simulates human cognition need not have conscious mental states. It is the strong claim, though, that has generated the most discussion, since this does entail that a computer can have cognitive mental states. In addition to the weak/strong distinction, it is also helpful to distinguish between other related notions. First, cognitive *simulation* is when a device such as a computer simply has the same the same input and output as a human. Second, cognitive *replication* occurs when the same internal causal relations are involved in a computational device as compared with a human brain. Third, cognitive *emulation* occurs when a computational device has the same causal relations *and* is made of the same stuff as a human brain. This condition clearly precludes silicon-based computing machines from emulating human cognition. Proponents of weak AI commit themselves only to the first condition, namely cognitive simulation. Proponents of strong AI, by contrast, commit themselves to the second condition, namely cognitive replication, but not the third condition.

Proponents of strong AI are split between two camps: (a) classical computationalists, and (b) connectionists. According to classical computationalism, computer intelligence involves central processing units operating on symbolic representations. That is, information in the form of symbols is processed serially (one datum after another) through a central processing unit. Daniel Dennett, a key proponent of classical computationalism, holds to a top-down progressive decomposition of mental activity. That is, more complex systems break down into more simple ones, which end in binary on-off switches. There is no homunculi, or tiny person inside a cognitive system which does the thinking. Several criticisms have been launched against the classical computationalist position. First, Dennett's theory, in particular, shows only that digital computers do not have homunculi. It is less clear that human cognition can be broken down into such subsystems. Second, there is no evidence for saying that cognition *is* computational in its structure, rather than saying that it is *like* computation. Since we do not find computational systems in the natural world, it is more safe to presume that human thinking is only *like* computational processes. Third, human cognition seems to involves a global understanding of one's environment, and this is not so of computational processes. Given these problems, critics contend that human thinking seems to be functionally different than digital or serial programming.

The other school of strong AI is connectionism which contends that cognition is distributed across a number of neural nets, or interconnective nodes. On this view, there is no central processing unit, symbols are not as important, and information is diverse and redundant. Perhaps most

importantly, it is consistent with what we know about neurological arrangement. Unlike computational devices, devices made in the neural net fashion can execute commonsense tasks, recognize patterns efficiently, and learn. For example, by presenting a device with a series of male and female pictures, the device picks up on patterns and can correctly identify new pictures as male or female. In spite of these advantages, several criticisms have been launched against connectionism. First, in teaching the device to recognize patterns, it takes too many training sessions, sometimes numbering in the thousands. Human children, by contrast, learn to recognize some patterns after a single exposure. Second, critics point out that neural net devices are not good at rule-based processing higher level reasoning, such as learning language. These tasks are better accomplished by symbolic computation in serial computers. A third criticism is offered by Fodor who maintains that connectionism is presented with a dilemma concerning mental representation;

1. **Mental representation is cognitive**
2. **If it is cognitive, then it is systematic (e.g., picking out one color or shape over another)**
3. **If it is systematic, then it is syntactic, like language, and consequently, it is algorithmic**
4. **However, if it is syntactic, then it is just the same old computationalism**
5. **If it is not syntactic, then it is not true cognition**

But connectionists may defend themselves against Fodor's attack in at least two ways. First, they may object to premise two and claim that cognitive representation is not systematic, but, instead, is pictorial or holistic. Second, connectionists can point out that the same dilemma applies to human cognition. Since, presumably, we would want to deny (4) and (5) as pertains to humans, then we must reject the reasoning that leads to it.

The most well known attack on strong AI, whether classical or connectionist, is John Searle's Chinese Room thought experiment. Searle's target is a computer program which allegedly interprets stories the way humans can by reading between the lines and drawing inferences about events in the story which we draw from our life experience. Proponents of strong AI say that the program in question (1) understands stories, and (2) explains human ability to understand stories (i.e., provides the sufficient conditions for "understanding"). In response, Searle offers the following thought experiment. Suppose that a non-Chinese speaking person is put in a room and given three sets of Chinese characters (a script, a story, and questions about the story). He also receives a set of rules in English which allow him to correlate the three sets of characters with each other (i.e., a program). Although the man does not know the meaning of the Chinese symbols, he gets so good at manipulating symbols that from the outside no one can tell if he is Chinese or not Chinese. For Searle, this goes against both of the above two claims of strong AI. Critics of Searle contend that the Chinese Room thought experiment does not offer a systematic exposition of the problems with strong AI, but instead is more like an expression of a religious conviction which the believer immediately "sees" and the disbeliever does not see.

Augustine (354-430)

EARLY YEARS. Augustine is the first ecclesiastical author the whole course of whose development can be clearly traced, as well as the first in whose case we are able to determine the exact period covered by his career, to the very day. He informs us himself that he was born at Thagaste (Tagaste; now Suk Arras), in proconsular Numidia, Nov. 13, 354; he died at Hippo Regius (just south of the modern Bona) Aug. 28, 430. [Both Suk Arras and Bona are in the present Algeria, the first 60 m. W. by s. and the second 65 m. w. of Tunis, the ancient Carthage.] His father Patricius, as a member of the council, belonged to the influential classes of the place; he was, however, in straitened circumstances, and seems to have had nothing remarkable either in mental equipment or in character, but to have been a lively, sensual, hot-tempered person, entirely taken up with his worldly concerns, and unfriendly to Christianity until the close of his life; he became a catechumen shortly before Augustine reached his sixteenth year (369-370). To his mother Monnica (so the manuscripts write her name, not Monica; b. 331, d. 387) Augustine later believed that he owed what lie became. But though she was evidently an honorable, loving, self-sacrificing, and able woman, she was not always the ideal of a Christian mother that tradition has made her appear. Her religion in earlier life has traces of formality and worldliness about it; her ambition for her son seems at first to have had little moral earnestness and she regretted his Manicheanism more than she did his early sensuality. It seems to have been through Ambrose and Augustine that she attained the mature personal piety with which she left the world. Of Augustine as a boy his parents were intensely proud. He received his first education at Thagaste, learning, to read and write, as well as the rudiments of Greek and Latin literature, from teachers who followed the old traditional pagan methods. He seems to have had no systematic instruction in the Christian faith at this period, and though enrolled among the catechumens, apparently was near baptism only when an illness and his own boyish desire made it temporarily probable.

His father, delighted with his son's progress in his studies, sent him first to the neighboring Madaura, and then to Carthage, some two days' journey away. A year's enforced idleness, while the means for this more expensive schooling were being accumulated, proved a time of moral deterioration; but we must be on our guard against forming our conception of Augustine's vicious living from the Conlessiones alone. To speak, as Mommsen does, of " frantic dissipation " is to attach too much weight to his own penitent expressions of self-reproach. Looking back as a bishop, he naturally regarded his whole life up to the " conversion " which led to his baptism as a period of wandering from the right way; but not long after this conversion, he judged differently, and found, from one point of view, the turning point of his career in his taking up philosophy -in his nineteenth year. This view of his early life, which may be traced also in the Confessiones, is probably nearer the truth than the popular conception of a youth sunk in all kinds of immorality. When he began the study of rhetoric at Carthage, it is true that (in company with comrades whose ideas of pleasure were probably much more gross than his) he drank of the cup of sensual pleasure. But his ambition prevented him from allowing his dissipations to interfere with his studies. His son

Adeodatus was born in the summer of 372, and it was probably the mother of this child whose charms enthralled him soon after his arrival at Carthage about the end of 370. But he remained faithful to her until about 385, and the grief which he felt at parting from her shows what the relation had been. In the view of the civilization of that period, such a monogamous union was distinguished from a formal marriage only by certain legal restrictions, in addition to the informality of its beginning and the possibility of a voluntary dissolution. Even the Church was slow to condemn such unions absolutely, and Monnica seems to have received the child and his mother publicly at Thagaste. In any case Augustine was known to Carthage not as a roysterer but as a quiet honorable student. He was, however, internally dissatisfied with his life. The Hortensius of Cicero, now lost with the exception of a few fragments, made a deep impression on him. To know the truth was henceforth his deepest wish. About the time when the contrast between his ideals and his actual life became intolerable, he learned to conceive of Christianity as the one religion which could lead him to the attainment of his ideal. But his pride of intellect held him back from embracing it earnestly; the Scriptures could not bear comparison with Cicero; he sought for wisdom, not for]Jumble submission to authority.

MANICHEAN AND NEOPLATONIST PERIOD. In this frame of mind he was ready to be affected by the Manichean propaganda which was then actively carried on in Africa, without apparently being much hindered by the imperial edict against assemblies of the sect. Two things especially attracted him to the Manicheans: they felt at liberty to criticize the Scriptures, particularly the Old Testament, with perfect freedom; and they held chastity and self-denial in honor. The former fitted in with the impression which the Bible had made on Augustine himself; the latter corresponded closely to his mood at the time. The prayer which he tells us he had in his heart then, " Lord, give me chastity and temperance, but not now," may be taken as the formula which represents the attitude of many of the Manichean auditores. Among these Augustine was classed during his nineteenth year; but he went no further, though he held firmly to Manicheanism for nine years, during which he endeavored to convert all his friends, scorned the sacraments of the Church, and held frequent disputations with catholic believers.

Having finished his studies, he returned to Thagaste and began to teach grammar, living in the house of Romanianus, a prominent citizen who had been of much service to him since his father's death, and whom he converted to Manicheanism. Monnica deeply grieved at her son's heresy, forbade him her house, until reassured by a vision that promised his restoration. She comforted herself also by the word of a certain bishop (probably of Thagaste) that "the child of so many tears could not be lost." He seems to have spent little more than a year in Thagaste, when the desire for a wider field, together with the death of a dear friend, moved him to return to Carthage as a teacher of rhetoric.

The next period was a time of diligent study, and produced (about the end of 380) the treatise, long since lost, *De pulchro et apto*. Meanwhile the hold of Manicheanism on him was loosening. Its feeble cosmology and metaphysics had long since failed to satisfy him, and the astrological superstitions springing from the credulity of its disciples offended his reason. The members of the sect, unwilling to lose him, had great hopes from a meeting with their leader Faustus of Mileve; but when he came to Carthage in the autumn of 382, he too proved disappointing, and Augustine ceased to be at heart a Manichean. He was not yet, however, prepared to put anything in the place of the doctrine he had held, and remained in outward communion with his former associates while he pursued his search for truth. Soon after his Manichean convictions had broken down, he left Carthage for Rome, partly, it would seem, to escape the preponderating influence of his mother on a mind which

craved perfect freedom of investigation. Here he was brought more than ever, by obligations of friendship and gratitude, into close association with Manicheans, of whom there were many in Rome, not merely auditores but *perfecti* or fully initiated members. This did not last long, however, for the prefect Symmachus sent him to Milan, certainly before the beginning of 385, in answer to a request for a professor of rhetoric.

The change of residence completed Augustine's separation from Manicheanism. He listened to the preaching of Ambrose and by it was made acquainted with the allegorical interpretation of the Scriptures and the weakness of the Manichean Biblical criticism, but he was not yet ready to accept catholic Christianity. His mind was still under the influence of the skeptical philosophy of the later Academy. This was the least satisfactory stage in his mental development, though his external circumstances were increasingly favorable. He had his mother again with him now, and shared a house and garden with her and his devoted friends Alypius and Nebridius, who had followed him to Milan; his assured social position is shown also by the fact that, in deference to his mother's entreaties, he was formally betrothed to a woman of suitable station. As a catechumen of the Church, he listened regularly to the sermons of Ambrose. The bishop, though as yet he knew nothing of Augustine's internal struggles, had welcomed him in the friendliest manner both for his own and for Monnica's sake. Yet Augustine was attracted only by Ambrose's eloquence, not by his faith; now he agreed, and now he questioned. Morally his life was perhaps at its lowest point. On his betrothal, he had put away the mother of his son; but neither the grief which he felt at this parting nor regard for his future wife, who was as yet too young for marriage, prevented him from taking a new concubine for the two intervening years. Sensuality, however, began to pall upon him, little a s he cared to struggle against it. His idealism was by no means dead; he told Romanian, who came to Milan at this time on business, that he wished lie could live altogether in accordance with the dictates of philosophy; and a plan was even made for the foundation of a community retired from the world, which should live entirely for the pursuit of truth. With this project his intention of marriage and his ambition interfered, and Augustine was further off than ever from peace of mind.

In his thirty-first year he was strongly attracted to Neoplatonism by the logic of his development. The idealistic character of this philosophy awoke unbounded enthusiasm, and he was attracted to it also by its exposition of pure intellectual being and of the origin of evil. These doctrines brought him closer to the Church, though he did not yet grasp the full significance of its central doctrine of the personality of Jesus Christ. In his earlier writings he names this acquaintance with the Neoplatonic teaching and its relation to Christianity as the turning-point of his life, though in the Confessiones it appears only as a statue on the long, road of error. The truth, as it may be established by a careful comparison of his earlier and later writings, is that his idealism had been distinctly strengthened by Neoplatonism, which had at the same time revealed his own, will, and not a *natura altera* in him, as the subject of his baser desires. This made the conflict between ideal and actual in his life more unbearable than ever. Yet his sensual desires were still so strong that it seemed impossible for him to break away from them.

CONVERSION AND ORDINATION. Help came in a curious way. A countryman of his, Pontitianus, visited him and told him things which he had never heard about the monastic life and the wonderful conquests over self which had been won under its inspiration. Augustine's pride was touched; that the unlearned should take the kingdom of heaven by violence, while he with all his learning was still held captive by the flesh, seemed unworthy of him. When Pontitianus had gone, with a few vehement words to Alypius, he went hastily with him into the garden to fight out this

new problem. Then followed the scene so often described. Overcome by his conflicting emotions he left Alypius and threw himself down under a fig-tree in tears. From a neighboring house came a child's voice repeating again and again the simple words Tolle, lege, " Take up and read." It seemed to him a heavenly indication; he picked up the copy of St. Paul's epistles which he had left where he and Alypius had been sitting, and opened at Romans xiii. When he came to the words, " Let us walk honestly as in the day; not in rioting and drunkenness, not in chambering and wantonness," it seemed to Mm that a decisive message had been sent to his own soul, and his resolve was taken. Alypius found a word for himself a few lines further, " Him that is weak in the faith receive ye;" and together they went into the house to bring the good news to Monnica. This was at the end of the summer of 386.

Augustine, intent on breaking wholly with his old life, gave up his position, and wrote to Ambrose to ask for baptism. The months which intervened between that summer and the Easter of the following year, at which, according to the early custom, he intended to receive the sacrament, were spent in delightful calm at a country-house, put at his disposal by one of his friends, at Cassisiacum (Casciago, 47 m. n. by w. of Alilan). Here Monnica Alypius, Adeodatus, and some of his pupils kept him company, and he still lectured on Vergil to them and held philosophic discussions. The whole party returned to Milan before Easter (387), and Augustine, with Alypius and Adeodatus, was baptized. Plans were then made for returning to Africa; but these were upset by the death of Monnica, which took place at Ostia as they were preparing to cross the sea, and has been described by her devoted son in one of the most tender and beautiful passages of the Conlessiones. Augustine remained at least another year in Italy, apparently in Rome, living the same quiet life which he had led at Cassisiacum, studying and writing, in company with his countryman Evodius, later bishop of Uzalis. Here, where he had been most closely associated with the Manicheans, his literary warfare with them naturally began; and he was also writing on free will, though this book was only finished at Hippo in 391. In the autumn of 388, passing through Carthage, he returned to Thagaste, a far different man from the Augustine who had left it five years before. Alypius was still with him, and also Adeodatus, who died young, we do not know when or where. Here Augustine and his friends again took up a quiet, though not yet in any sense a monastic, life in common, and pursued their favorite studies. About the beginning of 391, having found a friend in Hippo to help in the foundation of what he calls a monastery, he sold his inheritance, and was ordained presbyter in response to a general demand, though not without misgivings on his own part.

The years which he spent in the presbyterate (391-395) are the last of his formative period. The very earliest works which fall within the time of his episcopate show us the fully developed theologian of whose special teaching we think when we speak of Augustinianism. There is little externally noteworthy in these four years. He took up active work not later than the Easter of 391, when we find him preaching to the candidates for baptism. The plans for a monastic community which had brought him to Hippo were now realized. In a garden given for the purpose by the bishop, Valerius, he founded his monastery, which seems to have been the first in Africa, and is of especial significance because it maintained a clerical school and thus made a connecting link between monasticis and the secular clergy. Other details of this period are that he appealed to Aurelius, bishop of Carthage, to suppress the custom of holding banquets and entertainments in the churches, and by 395 had succeeded, through his courageous eloquence, in abolishing it in Hippo; that in 392 a public disputation took place between him and a Manichean presbyter of Hippo, Fortunatus; that his treatise De fide et symbols was prepared to be read before the council held at Hippo October 8, 393; and that after that he was in Carthage for a while, perhaps in

connection with the synod held there in 394.

LATER YEARS. The intellectual interests of these four years are more easily determined, principally concerned as they are with the Manichean controversy, and producing the treatises *De utilitate credendi* (391), *De duabus animabus contra Manichaos* (first half of 392), and *Contra Adimantum* (394 or 395). His activity against the Donatists also begins in this period, but he is still more occupied with the Manicheans, both from the recollections of his own past and from his increasing knowledge of Scripture, which appears, together with a stronger hold on the Church's teaching, in the works just named, and even more in others of this period, such as his expositions of the Sermon on the Mount and of the Epistles to the Romans and the Galatians. Full as the writings of this epoeli are, however, of Biblical phrases and terms,-grace and the law, predestination, vocation, justification, regeneration-a reader who is thoroughly acquainted with Neoplatonism will detect Augustine's aid love of it in a Christian dress in not a few places. He has entered so far into St. Paul's teaching that humanity as a whole appears to him a *massa peccati* or *peccatorum*, which, if left to itself, that is, without the grace of God, must inevitably perish. However much we are here reminded of the later Augustine, it is clear that he still held the belief that the free will of man could decide his own destiny. He knew some who saw in Romans ix an unconditional predestination which took away the freedom of the will; but he was still convinced that this was not the Church's teaching. His opinion on this point did not change till after he was a bishop.

The more widely known Augustine became, the more Valerius, the bishop of Hippo, was afraid of losing him on the first vacancy of some neighboring see, and desired to fix him permanently in Hippo by making him coadjutor-bishop,-a desire in which the people ardently concurred. Augustine was strongly opposed to the project, though possibly neither he nor Valerius knew that it might be held to be a violation of the eighth canon of Niema, which forbade in its last clause " two bishops in one city "; and the primate of Numidia, Megalius of Calama, seems to have raised difficulties which sprang at least partly from a personal lack of confidence. But Valerius carried his plan through, and not long before Christmas, 395, Augustine was consecrated by Megalius. It is not known when Valerius died; but it makes little difference, since for the rest of his life he left the administration more and more in the hands of his assistant. Space forbids any attempt to trace events of his later life; and in what remains to be said, biographical interest must be largely our guide. We know a considerable number of events in Augustine's episcopal life which can be surely placed-the so-called third and eighth synods of Carthage in 397 and 403, at which, as at those still to be mentioned, he was certainly present; the disputation with the Manichean Felix at Hippo in 404; the eleventh synod of Carthage in 407; the conference with the Donatists in Carthage, 411; the synod of Mileve, 416; the African general council at Carthage, 418; the journey to Caesarea in Mauretania and the disputation with the Donatist bishop there, 418; another general council in Carthage, 419; and finally the consecration of Eraclius as his assistant in 426.

ANTI-MANICHEANISM. AND PELAGIAN WRITINGS. His special and direct opposition to Manicheanism did not last a great while after his consecration. About 397 he wrote a *tractate Contra epistolam [Manichcet] quam vocant fundamenti*; in the *De agone christiano,* written about the same time, and in the *Confessiones,* a little later, numerous anti-Manichean expressions occur. After this, however, he only attacked the Manicheans on some special occasion, as when, about 400, on the request of his "brethren," he wrote a detailed rejoinder to Faustus, a Manichean bishop, or made the treatise *De natura boni* out of his discussions with Felix; a little later, also, the letter of the Manichean Secundinus gave him occasion to write Contra Secundinum, which, in spite of its comparative brevity, he regarded as the best of his writings on this subject. In the succeeding

period, lie was much more occupied with anti-Donatist polemics, which in their turn were forced to take second place by the emergence of the Pelagian controversy.

It has been thought that Augustine's anti-Pelagian teaching grew out of his conception of the Church and its sacraments as a means of salvation; and attention was called to the fact that before the Pelagian controversy this aspect of the Church had, through the struggle with the Donatists, assumed special importance in his mind. But this conception should be denied. It is quite true that in 395 Augustine's views on sin and grace, freedom and predestination, were not what they afterward came to be. But the new trend was given to them before the time of his anti-Donatist activity, and so before he could have heard anything of Pelagius. What we call Augustinianism was not a reaction against Pelagianism; it would be much truer to say that the latter was a reaction against Augustine's views. He himself names the beginning of his episcopate as the turning-point. Accordingly, in the first thing which he wrote after his consecration, the *De diversis gucestionibus ad Simplicianum* (396 or 397), we come already upon the new conception. In no other of his writings do we see as plainly the gradual attainment of conviction on any point; as he himself says in the *Retractationes*, he was laboring for the free choice of the will of man, but the grace of God won the day. So completely was it won, that we might set forth the specifically Augustinian teaching on grace, as against the Pelagians and the Massilians, by a series of quotations taken wholly from this treatise. It is true that much of his later teaching is still undeveloped here; the question of predestination (though the word is used) does not really come up; he is not clear as to the term " election"; and nothing is said of the " gift of perseverance." But what we get on these points later is nothing but the logical consequence of that which is expressed here, and so we have the actual genesis of Augustine's predestinarian teaching under our eyes. It is determined by no reference to the question of infant baptism -- still less by any considerations connected with the conception of the Church. The impulse comes directly from Scripture, with the help, it is true, of those exegetical thoughts which he mentioned earlier as those of others and not his own. To be sure, Paul alone can not explain this doctrine of grace; this is evident from the fact that the very definition of grace is non-Pauline. Grace is for Augustine, both now and later, not the *misericordia peccata* condonans of the Reformers, as justification is not the alteration of the relation to God accomplished by means of the *accipere remissionem*. Grace is rather the misericordia which displays itself in the divine *inspiratio* and justification is *justum* or *pium fieri* as a result of this. We may even say that this grace is an *interne illuminatio* such as a study of Augustine's Neoplatonism enables us easily to understand, which restores the connection with the divine *bonum esse*. He had long been convinced that " not only the greatest but also the smallest good things can not be, except from him from whom are all good things, that is, from God;" and it might well seem to him to follow from this that faith, which is certainly a good thing, could proceed from the operation of God alone. This explains the idea that grace works like a law of nature, drawing the human will to God with a divine omnipotence. Of course this Neoplatonic coloring must not be exaggerated; it is more consistent with itself in his earlier writings than in the later, and he would never have arrived at his predestinarian teaching without the New Testament. With this knowledge, we are in a position to estimate the force of a difficulty which now confronted Augustine for the first time, but never afterward left him, and which has been present in the Roman Catholic teaching even down to the Councils of Trent and the Vitican. If faith depends upon an action of our own, solicited but not caused by vocation, it can only save a man when, *per fidem gratiam accipiens*, he becomes one who not merely believes in God but loves him also. But if faith has been already inspired by grace, and if, while the Scripture speaks of justification by faith, it is held (in accordance with the

definition of grace) that justification follows upon the *infitsio caritatis,* -then either the conception of the faith which is God-inspired must pass its fluctuating boundaries and, approach nearer to that of caritas, or the conception of faith which is unconnected with caritas will render the fact of its inspiration unintelligible and justification by faith impossible. Augustine's anti-Pelagian writings set forth this doctrine of grace more clearly in some points, such as the terms " election," " predestination," " the gift of perseverance," and also more logically; but space forbids us to show this here, as the part taken in this controversy by Augustine is so fully detailed elsewhere.

ACTIVITY AGAINST DONATISM. In order to arrive at a decision as to what influence the Donatist controversy had upon Augustine's intellectual development, it is necessary to see how long and how intensely he was concerned with it. We have seen that even before he was a bishop he was defending the catholic Church against the Donatists; and after his consecration he took part directly or indirectly in all the important discussions of the matter, some of which have been already mentioned, and defended the cause of the Church in letters and sermons as well as in his more formal polemical writings. The first of these which belongs to the period of his episcopate, *Contra partem Donati,* has been lost; about 400 he wrote the two cognate treatises *Contra epistulam Parmeniani* (the Donatist bishop of Carthage) and *De baptismo contra Donatistas*. He was considered by the schismatics as their chief antagonist, and was obliged to defend himself against a libelous attack on their part in a rejoinder now lost. From the years 401 and 402 we have the reply to the Donatist bishop of Cirta, *Contra epistulam Petiliani*, and also the *Epistula ad catholicos de unitate ecclesioe*. The conflict was now reaching its most acute stage. After the Carthaginian synod of 403 had made preparations for a decisive debate with the Donatists, and the latter had declined to fall in with the plan, the bitterness on both sides increased. Another synod at Carthage the following year decided that the emperor should be asked for penal laws against the Donatists. Honorius granted the request; but the employment of force in matters of belief brought up a new point of discord between the two sides. When these laws were abrogated (409), the plan of a joint conference was tried once more in June, 411, under imperial authority, nearly 300 bishops being present from each side, with Augustine and Aurelius of Carthage as the chief representatives of the Catholic cause. In the following year, the Donatists proving insubordinate, Honorius issued a new and severer edict against them, which proved the beginning of the end for the schism. For these years from 405 to 412 we have twenty-one extant letters of Augustine's bearing on the controversy, and there were eight formal treatises, but four of these are lost. Those which we still have are: *Contra Cresconium grammaticum* (about 406*); De unico baptismio* (about 410 or 411), in answer to a work of the same name by Petilian; the brief report of the conference (end of 411); and the *Liber contra Donatistas post collationem* (probably 412).

DEVELOPMENT OF HIS VIEWS. The earliest of the extant works against the Donatists present the same views of the Church and its sacraments which Augustine developed later. The principles which he represented in this conflict are merely those which, in a simpler form, had either appeared in the anti-Donatist polemics before his time or had been part of his own earlier belief. What he did was to formulate them with more dogmatic precision,. and to permeate the ordinary controversial theses with his own deep thoughts on *unitas, caritas,* and *inspiratio gratice* in the Church, thoughts which again trace their origin back to his Neoplatonic foundations. In the course of the conflict he changed his, opinion about the methods to be employed; he had at first been opposed to the employment of force, but later came to the " Compel them to come in " point of view. It may well be doubted, however, if the practical struggle with the schismatics had as much to do with Augustine's development as has been supposed. Far more weight must be attached to the

fact that Augustine had become a presbyter and a bishop of the catholic Church, and as such worked continually deeper into the ecclesiastical habit of thought. This was not hard for the son of Monnica and the reverent admirer of Ambrose. His position as a bishop may fairly be said to be the only determining factor in his later views besides his Neoplatonist foundation, his earnest study of the Scripture, and the predestinarian conception of grace which he got from this. Everything else is merely secondary. Thus we find Augustine practically complete by the beginning of his episcopate-about the time when he wrote the Confessiones. It would be too much to say that his development stood still after that; the Biblical and ecclesiastical coloring of his thoughts becomes more and more visible and even vivid; but such development as this is no more significant than the effect of the years seen upon a strong face; in fact, it is even less observable here-for while the characteristic features of his spiritual mind stand out more sharply as time goes on with Augustine, his mental force shows scarcely a sign of age at seventy. His health was uncertain after 386, and his body aged before the time; on Sept. 26, 426, he solemnly designated Eraclius (or Heraclius) as his successor, though without consecrating him bishop, and transferred to him such a portion of his duties as was possible. But his intellectual vigor remained unabated to the end. We see him, as Prosper depicts him in his chronicle, " answering the books of Julian in the very end of his days, while the on-rushing Vandals were at the gates, and gloriously persevering in the defense of Christian grace." In the third month of the siege of Hippo by the barbarian invaders, lie fell ill of a fever and, after lingering more than ten days, died Aug. 28, 430. He was able to read on his sick-bed; he had the Penitential Psalms placed upon the wall of his room where he could see them. Meditating upon them, he fulfilled what he had often said before, that even Christians revered for the sanctity of their lives, even presbyters, ought not to leave the world without fitting thoughts of penitence.

MISCELLANEOUS WORKS. Of works not yet mentioned, those written after 395 and named in the Retractationes, may be classified under three heads-exegetical works; minor dogmatic, polemical, and practical treatises; and a separate class containing four more extensive works of special importance. The earliest of the minor treatises *is De catechizandis rudibus* (about 400), interesting for its connection with the history of catechetical instruction and for many other reasons. A brief enumeration of the others will suffice; they are: *De opera monachorum* (about 400); *De bono conjugali and De sancta virginitate* (about 401), both directed against Jovinian's depreciation of virginity; *De deviation damonum* (between 406 and 411); *De fide et operibus* (413), a completion of the argument in the *De spiritu et litera*, useful for a study of the difference between the Augustinian and the Lutheran doctrines of grace; *De cura pro mortuis*, interesting as showing his attitude toward superstition within the Church; and a few others of less interest. We come now to the four works which have deserved placing in a special category. One is the *De doctrina christiana* (begun about 397, finished 426), important as giving his theory of scriptural interpretation and homiletics; another is *the Enchiridion de fide, spe, et caritate* (about 421), noteworthy as an attempt at a systematic collocation of his thoughts. There remain the two doctrinal masterpieces, the *De trinitate* (probably begun about 400 and finished about 416) and the *De civitate Dei* (begun about 413, finished about 426). The last-named, beginning with an apologetic purpose, takes on later the form of a history of the City of God from its beginnings,

Francis Bacon (1516-1626)

LIFE. Francis Bacon was born in London on January 22, 1561, at York House off the Strand. He was the younger of two sons of Sir Nicholas Bacon, Lord Keeper of the Great Seal under Queen Elizabeth I. Bacon had a virtual dualistic upbringing. His mother was a zealous Puritan. Bacon's father hoped Francis would become a diplomat and taught him the ways of a courtier.

In 1573, Bacon entered Trinity College, Cambridge and studied there until 1575. His father died when Bacon was eighteen and, because Bacon was the youngest, he remained virtually penniless. The only way he saw for a poor man to get out and establish himself, both financially and socially, was to study law. In 1576, Bacon was admitted as a senior governor of Gray's Inn, an institution for legal education. He became one of the leading lawyers in England, thus earning the queen's notice. In 1584, at the age of twenty-three, he established a seat for himself in the House of Commons. While in position to obtain the office of attorney general to Queen Elizabeth, he criticized a taxation policy in Parliament. This event destroyed any chance he might have had for the position under Elizabeth. Bacon's closest friend was the Earl of Essex, who, unlike Bacon, was looked upon with favor by the queen. Bacon used the Earl to help regain the status necessary to gain the position of attorney general. However, this plan did not work, and Essex also fell out of her favor. The Earl was accused of going against the queen's orders, brought to trial and eventually to the scaffold, with Bacon as prosecutor. Bacon later defended his own actions in "An Apology in Certain Imputation Concerning the late Earl of Essex."

With the death of Elizabeth and the succession of James I, Bacon was established as solicitor general. He later achieved attorney general, and eventually took over his father's old position of the Lord Keeper of the Great Seal. Bacon rose in rank again when a long time rival, Sir Edward Coke, was removed from his position after refusing to force a confession out of a prisoner and pronounce him guilty. In 1602, Bacon was knighted, and in 1605 he married Alice Barnham, the daughter of a London alderman. He rose through various posts in the public service until he reached the Lord Chancellorship in 1618. Later that year, at the age of fifty-seven, he was established as Baron Verulam. In 1621, he was made Viscount St. Albans. That same year, he was charged with accepting bribes, tried and found guilty. His offices were taken from him and he was sentenced to: a fine of ,40,000, imprisonment during the king's pleasure, expatriation from parliament and coming within twelve miles of the court. Feeling utter disgrace, he went into retirement and devoted the remainder of his life to study and literary work. The parliamentary sentence, however, was not imposed, and King James I practically remitted his fine. In 1622, Bacon was allowed to come to London and, eventually, to kiss the king's hand.

In March 1626, Bacon bought a chicken in order to see how long its flesh could be preserved by stuffing it with snow. He caught cold and went to stay at the Earl of Arundel's house nearby. Bacon preferred the nobleman's best room, where there was a damp bed, to a more modest room in which there was a dry bed. On April 9, 1626, due to complications arising from bronchitis, Francis

Bacon died at Highgate, in the Earl of Arundel's house.

NOVUM ORGANUM. During his years of political service, Francis Bacon published a collection of essays and several works on reorganizing the natural sciences. The most important of the latter was the *Novum Organum,* written in 1620. The title is taken from Aristotle's *Organum,* meaning "logical works", and accordingly signals a radical departure from the traditional method of scientific inquiry. This work, along with the rest of his published and unpublished philosophical writings, can be seen as part of his grandiose plan to reorganize the sciences. This reorganization involved a projected, and largely unfinished, six-part work entitled *Instauratio*. The plan involved:

1. **A new division of the sciences,**
2. **A new method of scientific inquiry,**
3. **A collection of scientific observations and facts,**
4. **Examples of the new method,**
5. **Philosophical precursors to the new philosophy, and**
6. **The new philosophy itself resulting from the application of the new method.**

The *Novum Organum,* a work which may be viewed as a preliminary of division two of the *Instauratio*, is divided into two parts. The first part, Book I, deals with the need for an inductive system, and the second, Book II, deals with the applications of such a method.

In Book I, Bacon grounds the human understanding in observation and experience which leads to a harsh rejection of the popular Aristotelian a priori, deductive method. The alternative he proposes is an *a posteriori,* inductive approach.

Bacon's idea of such an approach is made metaphorically in one of his aphorisms (XCV). Commonly used symbols for understanding nature are those of the ant and spider. The ant experiments by collecting and using. This method symbolizes the human tendency to use facts without clearly understanding them. The spider, on the other hand, does not experiment but produces webs from its own substance, symbolizing the tendency to formulate ideas and facts by thought alone. The method for understanding nature Bacon holds to be the most significant is that of the bee which gathers the pollen of the flower, changes it through its own efforts, and then uses it. According to Bacon, we must observe and collect experiences, analyze exactly what we know, then act on the most reliable facts.

Bacon also distinguishes between the *Anticipation of Nature* and the *Interpretation of Nature*. Few reasons exist for believing in the *Anticipations*. They are generalizations which are easily believed. The *Interpretations* are based on various data which enables one to master things. The *Interpretations* are not easily accepted, but are clearly the most stable method of analyzing nature.

One of the most important of Bacon's beliefs, and the one for which he was most widely known, is his idea of the *Four Idols*. These Idols are what he believes to be the primary hindrance to our efforts in studying nature. The first are the *Idols of the Tribe*. These have their foundation in human nature. Humans falsely assume their perceptions are based on universals when in fact their perceptions are based purely on individual views. The second are *The Idols of the Cave*. These are distinguished from the *Idols of the Tribe* and deal with the individual, for every person perceives things by means of his own individual nature. One's personality and experiences make them see things in ways which they may not be. The third are *The Idols of the Marketplace*. These Idols deal with the language of people. Because of the errancy in choosing which words to use in order to convey a certain meaning, one may express the wrong idea to another. The fourth are *The Idols of*

***the Theatre*. These Idols deal with the dogmas of all philosophies. What is already established and believed to be true may not be. One cannot be biased toward any popular belief system.**

In Book II, Bacon describes the part of his method involved with gathering facts. Aristotle contended that science involves the discovery of a phenomenon's causes. For example, to understand the nature of heat, we must discover the causes of heat. For Aristotle, this process involves uncovering all four of its causes: formal, material, efficient, and final. In spite of Bacon's harsh rejection of Aristotle's deductive syllogism, Bacon follows Aristotle by seeing science as the discovery of causes, and, specifically, formal causes. According to Bacon, the formal causes of a thing (that is to say, its "forms") are its physical properties. For example, the form of heat is the violent, irregular motion of particles. Thus, by discovering this form of heat, we reveal the scientific nature of heat itself. For Bacon a good set of rules of scientific method will reveal the forms of a thing. He notes four things that we should expect from a good set of such rules. First, it will not deceive him; second, it will not tie him down to any particular mode of operation; third, it leads to action; and fourth it will lead to the discovery of the necessary and sufficient conditions of a given nature (such as heat). The forms, then, are just those necessary and sufficient conditions (such as violent, irregular motion of particles).

Having maintained the job of science is to uncover a thing's forms, Bacon finally explains the inductive method by which this uncovering is performed. Bacon's specific inductive methodology is presented in what he describes as the three "Tables of Comparative Instances" which involve presence, absence, and degrees. The "Table of Presence" (agreement) involves examining instances in which the same phenomena are present, and noting what other circumstances are in common. For example, to understand the forms involved with heat, we examine all hot things and see what circumstance is in common, such as irregular motion of particles. The second table, the "Table of Absence," involves examining instances in which a phenomenon is absent, and noting what circumstances are in common. Thus, to understand heat, for example, we must also examine a list of cold things and discern what features are irrelevant to the production of heat, such as density. Finally, the "Table of Degrees" involves examining instances in which a phenomenon is present in varying degrees, noting what circumstances also vary. For example, to understand heat we must observe things at different temperatures and note what circumstances are present in varying degrees, such as varying speeds in the irregular motion of particles. By constructing the three "Tables of Comparable Instances" we eliminate irrelevant properties, such as density, and pinpoint the essential properties, such as the irregular motion of particles. This, according to Bacon, is true induction. Bacon recognized that we cannot examine an endless number of instances for the three tables. At some point we must stop and survey the instances so far. This review he calls the "first vintage."

The Bakhtin Circle

The Bakhtin Circle was a contemporary school of Russian thought which centered on the work of Mikhail Mikhailovich Bakhtin (1895-1975). The circle addressed the social and cultural issues posed by the Russian Revolution and its degeneration into the Stalin dictatorship in philosophical terms. Their work focused on the centrality of questions of signification in social life in general and artistic creation in particular, examining the way in which language registered the conflicts between social groups. The key views of the circle are that linguistic production is essentially *dialogic*, formed in the process of social interaction and that this leads to the iteraction of different social values being registered in terms of reaccentuation of the speech of others. While the ruling stratum tries to posit a single discourse as exemplary, the subaltern classes are inclined to subvert this *monologic* closure. In the sphere of literature, poetry and the epic represent the centripetal forces within the cultural arena while the novel is the structurally elaborated expression of popular *ideologiekritik*. Members of the circle included Matvei Isaevich Kagan (1889-1937); Pavel Nikolaevich Medvedev (1891-1938); Lev Vasilievich Pumpianskii (1891-1940); Ivan Ivanovich Sollertinskii (1902-1944); Valentin Nikolaevich Voloshinov (1895-1936) and others.

M.M. Bakhtin and his circle began meeting in the Belorussian towns of Nevel and Vitebsk in 1918 before moving to Leningrad in 1924. Their group meetings were terminated due to the arrest of many of the group in 1929. From this time until his death in 1975, Bakhtin continued to work on the topics which had occupied his group, living in internal exile first in Kustanai (Kazakhstan, 1930-36), Savelovo (about 100 km from Moscow, 1937-45), Saransk (Mordovia, 1936-7, 1945-69) and finally moving in 1969 to Moscow, where he died at the age of eighty. In Saransk Bakhtin worked at the Mordov Pedagogical Institute (now University) until retirement in 1961.

The Bakhtin circle is reputed to have been initiated by Kagan on his return from Germany, where he had studied philosophy in Leipzig, Berlin and Marburg. He had been a pupil of the founder of Marburg Neo-Kantianism Herman Cohen and had attended lectures by Ernst Cassirer. Kagan established a 'Kantian Seminar' at which various philosophical, religious and cultural issues were discussed. Kagan was a Jewish intellectual who had been a member of the Social Democratic Party (the precursor of the Bolsheviks and Mensheviks) and he may have been attracted to Cohen's philosophy for its supposed affinity with Marxism (Cohen regarded his ethical philosophy as completely compatible with that of Marx), while rejecting the atheism of Russian Communism. Whatever the truth of the matter, the members of the circle did not restrict themselves to academic philosophy but became closely involved in the radical cultural activities of the time, activities which became more intense with the movement of the group to Vitebsk, where many important avant-garde artists such as Malevich and Chagall had settled to avoid the privations of the Civil War. One of the group, Pavel Medvedev, a graduate in law from Petrograd University, became rector of the Vitebsk Proletarian University, editing the town's cultural journal *Iskusstvo* (Art) to which he and Voloshinov contributed articles, while Bakhtin and Pumpianskii both gave public lectures on a variety of philosophical and cultural topics, student notes from which have been

published recently. Pumpianskii, it is known, never finished his studies at Petrograd university, while it is doubtful whether Bakhtin had any formal higher education at all despite his claims, now disproven, to have graduated from the same University in 1918. It seems that Bakhtin attempted to gain acceptance in academic circles by adopting aspects of his older brother's biography. Nikolai Bakhtin had a solid classical education from his German governess and graduated from Petrograd University, where he had been a pupil of the renowned classicist F.F. Zelinskii. Bakhtin had therefore been exposed to philosophical ideas since his youth. After Nikolai's departure for the Crimea, and Mikhail's move to Nevel, it seems that Kagan took the place of his brother as unofficial mentor, having an important influence on Bakhtin's philosophy in a new and exciting cultural environment, although the two friends went their separate ways in 1921, the year Bakhtin married.

Kagan, however, moved to take up a teaching position at the newly established provincial university in Orel in 1921. While there he published the only sustained piece of philosophy to be published by a member of the group before the late 1920s entitled '*Kak vozmozhna istoria*'(How Is History Possible) in 1922. The same year he produced an obituary of Hermann Cohen in which he stressed the historical and sociological aspects of Cohen's philosophy and wrote other unpublished works. 1922 also saw the publication of Pumpianskii's paper '*Dostoevskii i antichnost´*' (Dostoevskii and Antiquity), a theme that was to recur in Bakhtin's work for many years. While Bakhtin himself did not publish any substantial work until 1929, he was clearly working on matters related to Neo-Kantian philosophy and the problem of authorship at this time. Bakhtin's earliest published work is the two page '*Iskusstvo i otvetstvennost´*' (Art and Answerability) from 1919 and fragments of a larger project on moral philosophy written between 1920 and 1924, now usually referred to as *K filosofii postupka* (Towards a Philosophy of the Act).

Most of the group's significant work was produced after their move to Leningrad in 1924. It seems that there the group became acutely aware of the challenge posed by Saussurean linguistics and its development in the work of the Formalists. Thus there emerges a new awareness of the importance of the philosophy of language in philosophy and poetics. The most significant work on the philosophy of language was published in the period 1926-1930 by Voloshinov: a series of articles and a book entitled *Marksizm i filosofia iazyka* (Marxism and the Philosophy of Language) (1929). Medvedev, who had been put in charge of the archive of the symbolist poet Aleksandr Blok, participated in the vigorous discussions between Marxist and formalist literary theorists with a series of articles and a book, *Formal´lnyi metod v literaturovedenii* (The Formal Method in Literary Scholarship) (1928) and the first book-length study of Blok's work. Voloshinov also published an article and a book (1925, 1926) on the debate which raged around Freudianism at the time. In 1929 Bakhtin produced the first edition of his famous monograph *Problemy tvorchestva Dostoevskogo* (Problems of Dostoevskii's Work), but many other works dating from 1924-9 remained unpublished and usually unfinished. Among these was a critical essay on formalism called '*Problema soderzheniia i formy v slovesnom khudozhestvennom tvorchestve*' (The Problem of Content, Material and Form in Verbal Artistic Creation) (1924) and a book length study called 'Avtor i geroi v esteticheskoi deiatel´nosti' (Author and Hero in Aesthetic Activity) (1924-7).

Since the 1970s the works published under the names of Voloshinov and Medvedev have often been ascribed to Bakhtin, who neither consented nor objected. A voluminous, ideologically motivated, often bad-tempered and largely futile body of literature has grown up to contest the issue one way or another, but since there is no concrete evidence to suggest that the published authors were not responsible for the texts which bear their names, there seems no real case to answer. It seems much

more likely that the materials were written as a result of lively group discussions around these issues, which group members wrote up according to their own perspectives afterwards. There are clearly many philosophical, ideological and stylistic discrepancies which, despite the presence of certain parallels and points of agreement, suggest these very different works were largely the work of different authors. In accordance with Bakhtin's own philosophy, it seems logical to treat them as rejoinders in ongoing dialogues between group members on the one hand and between the group and other contemporary thinkers on the other.

The sharp deterioration in the situation of unorthodox intellectuals in the Soviet Union at the end of 1928 effectively broke the Bakhtin circle up. Bakhtin, whose health had already begun to deteriorate, was arrested, presumably because of his connection with the St. Petersburg Religious-Philosophical society, and was sentenced to ten years on the Solovetskii Islands. After vigorous intercession by Bakhtin's friends, a favourable review of his Dostoevskii book by Commissar of Enlightenment Lunacharskii and a personal appeal by Maksim Gor´kii, this was commuted to six years exile in Kazakhstan. With the tightening of censorship at the time, very little was published by Voloshinov, while Medvedev published a book on theories of authorship *V laboratorii pisatelia* (In the Laboratory of the Writer) in 1933 and a new version of the Formalism study, revised to fit in more closely with the ideological requirements of the time, in 1934. Medvedev was appointed full professor at the Leningrad Historico-Philological Institute but was arrested and disappeared during the terror of 1938. Voloshinov worked at the Herzen Pedagogical Institute in Leningrad until 1934 when he contracted tuberculosis. He died in a sanitorium two year later leaving unfinished a translation of the first volume of Ernst Cassirer's *The Philosophy of Symbolic Forms,* a book which is of considerable importance in the work of the circle. Kagan died of angina in 1937 after working as editor of an encyclopedic atlas of energy resources in the Soviet Union for many years. Pumpianskii pursued a successful career as Professor of Literature at Leningrad University, but published only short articles and introductions to works of Russian authors, most notably Turgenev. Sollertinskii joined the Leningrad Philharmonic in 1927 as a lecturer, but soon established himself as one of the leading Soviet musicologists, producing over two hundred articles, books and reviews. He died of a heart attack, probably resulting from the privations of the Leningrad blockade, in 1944.

While in Kazakhstan Bakhtin began work on his now famous theory of the novel which resulted in the now famous articles *Slovo v romane* (Discourse in the Novel) (1934-5)*, Iz predystorii romannogo slovo* (From the Prehistory of Novelistic Discourse) (1940), *Epos i roman* (Epic and Novel) (1941), *Formy vremeni i khronotopa v romane* (Forms of Time and Chronotope in the Novel) (1937-8). Between 1936 and 1938 he completed a book on the *Bildungsroman* and its significance in the history of realism which was lost when the publishing house at which the manuscript was lying awaiting publication was destroyed in the early days of the German invasion of the Soviet Union in 1941. Voluminous, most still unpublished, preparatory material still exists, although part is lost, allegedly because Bakhtin used it for cigarette papers during the wartime paper shortage. Bakhtin's exceptional productiveness at this time is further accentuated when one considers that one of his legs was amputated in February 1938. He had suffered from inflammation of the bone marrow, osteomyelitis, for many years, which gave him a lot of pain, high temperatures, and often confined him to bed for weeks on end. This had been a factor in the appeals of his friends and acquaintances for clemency when he was internally exiled, a factor that may well have saved his life. This did not, however, prevent him from presenting a now famous doctoral thesis on Rabelais to the Gor´kii Institute of World Literature in 1940. The work proved extremely controversial in

the hostile ideological climate of the time and it was not until 1951 that Bakhtin was eventually granted the qualification of *kandidat*. It was not published in book form until 1965.

The period between the completion of the Rabelais study and the second edition of the Dostoevskii study in 1963 is perhaps the least well known of Bakhtin's life in terms of work produced. This has been recently (1996) rectified with the publication of archival materials from this period, when Bakhtin was working as a lecturer at the Mordov Pedagogical Institute. The most substantial work dating from this period is *Problema rechevykh zhanrov* (The Problem of Speech Genres) which was most likely produced in response to the reorganisation of Soviet linguistics in the wake of Stalin's article *Marksizm i voprosy iazykoznaniia* (Marxism and Questions of Linguistics) of 1953. Many other fragments exist from this time, including notes for a planned article about Maiakovskii and more methodological comments on the study of the novel.

In the more liberal atmosphere of the so-called 'thaw' following Khruschev's accession, Bakhtin's work on Dostoevskii came to the attention of a group of younger scholars led by Vadim Kozhinov who, upon finding out that he was still alive, contacted Bakhtin and tried to convince him to republish the 1929 Dostoevskii book. After some initial hesitation, Bakhtin responded by significantly expanding and fundamentally altering the overall project. It was accepted for publication in September 1963 and received a generally favourable reception. Publication of the Rabelais study, newly edited for purposes of acceptability (mainly the toning down of scatology and an analysis of a speech by Lenin) followed soon after. As Bakhtin's health continued to decline, he was taken to hospital in Moscow in 1969 and in May 1970 he and his wife, who died a year later, were moved into an old people's home just outside Moscow. Bakhtin continued to work until just before his death in 1975, producing work of a mainly methodological character.

Since Bakhtin's death, several collections of his work have appeared in Russian and many translations have followed. English language translations have been appearing since 1968, although the quality of translation and systematicity of publication has been uneven. Up to ten different translators have published work by a writer whose terminology is very specific, often rendering key concepts in a variety of different ways. This has exacerbated problems of interpretation and questions of theoretical heritage, especially since there is a quite sharp distinction between works written before and after the 1929 Dostoevskii study. Another problem has been the questions of authorship of the Bakhtin circle and the extent to which a Marxist vocabulary in the works of Voloshinov and Medvedev should be taken at face value. Those, for example, who argue Bakhtin was the author of these works also tend to argue that the vocabulary is mere 'window dressing' to facilitate publication, while those who support the authenticity of the original publications also tend to take the Marxist arguments seriously. As a result writers about Bakhtin have tended to choose one period of Bakhtin's career and treat it as definitive, a practice which has produced a variety of divergent versions of 'Bakhtinian' thought. The recent appearance of the first volume of a collected works in Russian might help to overcome the problems which have dogged Bakhtin studies.

THE EARLY WORKS 1919-1927. The work of the Bakhtin Circle should be regarded as a philosophy of culture. Questions which seem to be of very specific relevance such as the modality of author-hero relations actually involve questions of a much more general nature encompassing the value-laden relations between subject and object, subjects and other subjects. The phenomenological arguments presented by the young Bakhtin are directed against the abstractions of rationalist philosophy and contemporary positivism. He draws much of his conceptual structure from the work of the Marburg School (most notably Hermann Cohen (1842-1918), Paul Natorp

(1854-1924) and Nicolai Hartmann (1882-1950)) and German phenomenologists such as Max Scheler (1874-1928) and Heinrich Rickert (1863-1936). However, it is particularly difficult to trace the precise influence of these writers because Bakhtin was notoriously inconsistent in crediting his sources and was not averse to copying whole passages which he had translated from German into Russian in his works without reference to the original. This has led many commentators either to guess at influences on the young Bakhtin or to credit him with the invention of a philosophical vocabulary almost from nothing. However, recent archival work by Brian Poole has uncovered notebooks in which Bakhtin made copious notes from various German idealist philosophers which give us a better idea both of the sources of his ideas and the originality of the philosophical work which resulted from his fusion of disparate ideas.

The ideas of the Marburg School were undoubtedly filtered to Bakhtin through the works of Matvei Kagan on his return from Germany at the end of the First World War. In his obituary of Cohen Kagan stressed the religious, messianic aspects of the former's philosophy, which emerges in his later work. For the late Cohen, 'the unity of objective being, as an unending large process of the unity of being and concept demands the unending small unity of the singular individuum.... The whole problem of religion is contained in the problem of the individuum as in the question of God'. The continual relationship between the individuum and God is the absolute element of subjectivity and is the unity of monotheism. The individual does not combine with God but continually relates to God. This has social significance, for religion grows out of ethics: 'the religion of the unity of humanity is monotheism.... Religion is everywhere, in all regions of culture.... Religion itself is philosophy'. Problems of intersubjectivity must be related to questions of historical development: 'in our opinion, the problem of individual relationships, the problem of subjective consciousness, ontological subjectivity can be based on the pathos of the individual condition of the struggle of the historical life of culture, the person and humanity'. Kagan stresses the parallels between Cohen's ethics and the traditions of Russian populism, a factor which recurs later in Bakhtin's career when the novel becomes linked with a populist political process. (M. Kagan, *German Kogen*, 1922) The unity of the individual is dependent on the unity of the people and this is in turn dependent on the unity of God.

Whatever the difficulties of tracing his more immediate precursors there is no doubt that Bakhtin's philosophical project maintained a fundamental connection with the traditions of Enlightenment aesthetics and with Kantianism in particular. As for Kant, the aesthetic is distinguished by its 'disinterestedness', the uncoupling of purposiveness from representation of the end. Where Kant concentrated on aesthetic judgement, however, Bakhtin was interested in aesthetic *activity* which can help to establish a mode of reciprocal intersubjective relationships necessary to produce an intimate unity of individuals whose specificity is in no way endangered. This project, which remains constant throughout his work, adopts various forms. The aesthetic is the realm where now detached from the 'open event of being' and 'finalised' by virtue of the author's 'exteriority' (*vnenakhodimost´*), the value-laden essence of the hero's deed is manifested. If the hero's activity were not objectified by the author then he or she would remain in some perpetual stream of consciousness, completely oblivious to the wider significance of those deeds. However, in order to visualise the meaningful nature of those deeds, the author must also have an insight into the subjective world of the hero, his or her horizon, sphere of views and interests (*krugozor*). Only the appropriate mode of empathy and objectification can produce the sort of productive whole Bakhtin envisages.

Several problems arise from this model. The first is that Bakhtin seems to want to use the

author-hero model as a reciprocal principle within society and as a model of relations in literary composition. In the first model authors and heroes change their roles constantly, the unique perspective of each subject allows the objectification of others except oneself, who is objectified by others. Although the concept hardly appears in the early works, from 1928 onwards *dialogue* becomes the model of such interactions: one gains an awareness of one's own place within the whole through dialogue, which helps to bestow an awareness on others at the same time. A very pleasant model as long as relationships remain equal. Yet the author-hero model also assumes a fundamental inequality in that the hero of a work can never have a reciprocal vantage point from which to objectify the author and thus the creator. There is a crucial difference between a person-to-person and a person-to-God relationship which Bakhtin's model seems to obscure.

Furthermore, Bakhtin's model of the unique perspective of each author/hero, which is drawn from the Kantian model of an individual consciousness bearing a-priori categories encountering and giving form to the manifold of sense impressions, is seriously compromised when one admits a socio-linguistic dimension into the equation. This happens in Voloshinov's 1926 article on discourse in life and poetry. The alternative adopted by Voloshinov foregrounds the *intonational* dimension of language which manifests the unique evaluative connections between subject and object. Language enmeshed within everyday practical activity is extracted, or liberated, from its connection with the 'open event of being' by the author who then reflects upon it, from his or her own unique vantage point, manifesting its total intonational meaning. The hero's language is *alien* to the author and therefore ripe for objectification; the crucial category is the latter's exteriority. Stress on this intonational dimension allows the encounter of the two consciousnesses to be spoken about in phenomenological rather than linguistic terms and therefore allows Bakhtin to counter what he calls 'theoreticism', the tendency to consider the inner meaning of an action and its historical specificity in isolation from each other. This might include Hegel's tendency to view the particular incident as meaningful only as an instance of the unfolding of reason, Husserl's sublation of inter-subjective relations in transcendental subjectivity or the positivistic assumption that categorisation of a phenomenon is sufficient to explain that phenomenon.

The distinctively Bakhtinian approach to language only really begins to emerge in Voloshinov's 1926 essay *Slovo v zhizni i slovo v poezii: k voprosam sotsiologicheskoi poetiki* (Discourse in Life and Discourse in Poetry: Questions of Sociological Poetics), written during his postgraduate studies at the Institute of Material, Artistic and Verbal Culture in Leningrad where L.P. Iakubinskii, the pioneer of the study of dialogic speech, was among his advisers. This work, which has been seen as the earliest example of pragmatics by more than one commentator, is the first work of the circle to be presented as an explicitly Marxist text. The author attempts to define the aesthetic as a specific form of social interaction characterised by its 'completion by the creation of the artistic work and by its continual recreations in cocreative perception and it does not require any other objectifications'. In the artistic work unspoken social evaluations are 'condensed' and determine artistic form. The deeper structural features of a particular social interaction are made manifest in a successful artistic work; as Voloshinov puts it, 'form should be a convincing evaluation of the content' (*Bakhtin School Papers* ed. Shukman, Colchester 1983 p.9, 19, 20). The early Bakhtinian phenomenology is now recast in terms of discursive interaction, with a specifically sociological frame of reference.

Another of Voloshinov's projects was a critical response to incipient psychoanalysis and contemporary attempts to attempt a fusion of Marxism and Freudianism. In 1927 he published his first book called *Freidizm: Kriticheskii ocherk* (Freudianism a Critical Sketch), which continued the

theme of an earlier article from 1925 *Po tu storonu sotsial´nogo* (Just Beyond the Social) in which Freud was accused of a biological reductionism and subjectivism quite alien to the spirit of Marxism. Leaning upon a sociological analysis of language and culture, Voloshinov stresses that intersubjectivity precedes subjectivity as such and that all meaning production and thus repression of meanings are socio-ideological rather than individual and biological as Freud supposed. It must be noted, however, that Voloshinov does not pay any attention to Freud's later work on cultural phenomena and thus presents a rather one-sided view of contemporary psychology. Furthermore, Freudianism is treated as a manifestation of 'bourgeois decay' very much in the spirit of the later Lukács. This indicates a turning towards a more Hegelian approach to questions of cultural and philosophical development, while the recasting of the Freudian *superego* in terms of the repression of unofficial ideologies by an official ideology anticipates one of the central themes that would occupy Bakhtin in the 1930s and 1940s.

THE CONCLUDING WORKS OF THE BAKHTIN CIRCLE 1928-1929. In the late 1920s the sociological and linguistic turn signalled by Voloshinov's article on discourse had begun to form into a distinct school of thought in which language was the index of social relations and embodiment of ideological worldview. While Voloshinov's linguistic studies were undoubtedly crucial to this reorientation, one of the central influences on the group at the time was the work of Ernst Cassirer, whose ground-breaking *Philosophy of Symbolic Forms* (3 Vols) was published between 1923 and 1929. One of Voloshinov's unfinished projects, which he began while at University, was a translation of the first volume of Cassirer's work on language. This volume marked the culmination of Cassirer's move away from Marburg Neo-Kantianism to a Hegelian rectification of Kant. Adopting Hegel's dialectical orientation, evolutionary approach to human knowledge and existence and concentration of the totality of human activities, Cassirer sought to overcome the exclusivity of the Kantian focus on mankind's rational thought processes. At the same time, however, Cassirer strove to resist the Hegelian subsumption of all realms of the human spirit into the Absolute by retaining the Kantian distinction between the 'languages' of the human spirit. To this end Cassirer drew upon Herder and von Humboldt's identification of thought and signification, viewing the 'symbolic function' as the common element to all areas of knowledge, but which took a specific form in each of them. The truth, agreed Cassirer and Hegel, is whole, but the former understood this to mean that each of the perspectives offered by various symbolic forms is equally valid and must be progressively 'unfolded' so as to fully articulate itself. This formulation, as we shall see, had a far reaching effect on the later work of Bakhtin, but there are signs of its influence almost immediately in the work of the group.

In 1928 P.N. Medvedev published a book-length critique of Russian Formalism. This work begins with a definition of literary scholarship as 'one branch of the study of ideologies', a study which 'embraces all areas of man's ideological creativity'. Medvedev goes on to argue that while Marxism has established the bases of such a study, including its relationship to economic factors, the study of 'the distinctive features and qualitative individuality of each of the branches of ideological creation - science, art, ethics, religion, etc. - is still in the embryonic stage' (p.3). Despite the replacement of 'symbolic forms' with 'branches of ideological creation' the continuity of approach is clear. Where Cassirer sought to examine the symbolic function as 'a factor which recurs in each basic cultural form but in no two takes exactly the same shape' (vol. 1, p.84), Medvedev sought to investigate the 'sociological laws of development' which can be found in each 'branch' of 'ideological creation' but which manifests itself in specific ways. This sociological adaption of Cassirer's work was to feature largely in Bakhtin's work from the 1930s and 1940s, where, as Poole has demonstrated, many

unattributed passages from the former's work appear in Russian translation within the body of the latter's work. Medvedev felt that the Formalists were correct in attempting to define the specific features of literary creation but fundamentally mistaken in the positivistic approach they took towards literary *devices* which tended to efface the ideological, meaning-bearing and thus sociological aspect of literary form. In conclusion Medvedev recommended that the formalists be treated respectfully and seriously, even if their fundamental premises were erroneous. Marxist criticism, he argued, should value Formalism as an object of serious criticism through which the bases of the former can be clarified.

While subjecting the Russian Formalists to intense criticism on the basis of their partisan alliance with the Futurist movement and their sharing its tendency towards a nihilistic destruction of meaning, Medvedev particularly praised Western 'formalist art scholarship' such as the work of Hildebrand, Wölfflin and Worringer. These theorists were important for the development of the Bakhtin circle because they treated changes of artistic forms and styles as changes of 'artistic volition', i.e. having ideological significance. Worringer saw art history to be marked by an alternation of naturalism (empathy) and abstraction (estrangement) which correlated to the harmony or otherwise in the relationship of man and his environment. While formal and evaluative aspects are not identical, they do tend to maintain a close affiliation and this, Medvedev concluded, can be applied to literary form as well as visual art. This particular chapter, along with some shorter extracts of the book were omitted from the second edition of the book published with the title *Formalizm I formalisty* (Formalism and the Formalists) in 1934. By this time a tolerant attitude towards the Formalists or Western scholarship was not permitted, and thus an additional and extremely hostile chapter called 'The Collapse of Formalism' was included. Earlier writers on the Bakhtin Circle tended to ascribe the first edition to Bakhtin and the second to Medvedev, but it is clear that the body of the second edition is an expurgated version of the first.

Medvedev's formulation was carried over into Bakhtin's now famous study *Problemy tvorchestva Dostoevskogo* (Problems of Dostoevskii's Work) published in 1929. Here the great nineteenth-century novelist's own verbally affirmed and often reactionary ideology is downplayed in favour of his 'form-shaping ideology' which is seen to be imbued with a profoundly democratic spirit. Bakhtin attacks those critics, such as Engelgardt, who characterised Dostoevskii's creative method as Hegelian. In such a scheme two positions struggle for ascendancy but are transformed into a synthesis at the end; however, according to Bakhtin, there is no merging of voices into a final, authoritative voice as in the Hegelian absolute. Dostoevskii does not present an abstract dialectic but an unmerged *dialogue* of voices, each given equal rights. Bakhtin follows the nineteenth-century German novelist and critic Otto Ludwig in terming this type of dialogue 'polyphonic dialogue', which allows Cassirer's insistence on a plurality of cultural forms to be extended to a plurality of discourses in society and the novel. In the course of Dostoevskii's novels, argues Bakhtin, very much in the spirit of Cassirer, the worldviews of Dostoevskii's heroes 'unfold', presenting their own unique perspective upon the world. The novelist does not, as is the case with Tolstoi, submerge all positions beneath a single authoritative perspective, but allows the voice of the narrator to reside beside the voices of the characters, bestowing no greater authority on that voice than on any of the others. Voices intersect and interact, mutually illuminating their ideological structures, potentialities, biases and limitations.

Bakhtin's early phenomenology is now translated into discursive terms. Where Bakhtin was initially concerned with intersubjective relations and the modality of authorial and heroic interaction, this is now examined in terms of the way in which one language encounters another,

reporting and modifying the utterance by reaccentuating it. Modes of interaction range from stylisation to explicit parody, which Bakhtin spends a considerable proportion of the book cataloguing. As only the later edition of the book (1963) has been published in English, there is a tendency to confuse the chronology of the emergence of Bakhtin's key concepts. It should be noted that there is no reflection on carnival or on the Menippean Satire in the first edition of the Dostoevskii study. These features only emerged in the next decade in relation to the history of the novel as a genre. The first edition of the Dostoevskii study is a monograph on the work of the famous novelist in terms which in many respects embody the poetics of a significant portion of contemporary 'fellow-traveller' writing. When considered in its historical context, the Dostoevskii study can be seen as a sort of rearguard defence of liberality in the cultural arena against the encroachment of political control. The book was published on the eve of the destructive RAPP dictatorship, when bellicose advocates of 'proletarian culture' were granted free reign by the newly victorious Stalinist leadership of the Soviet Communist Party. Formal experimentation and an inadequately tendentious narrative position was branded as reactionary, while Bakhtin's work defended the presentation of a plurality of perspectives free from 'monologic' closure. The formal characteristics of a work were themselves of ideological significance, but the reactionary tendency was in the imposition of a unitary perspective on a varied community of opinion.

The semiotic dimension of the new orientation of the Bakhtin Circle was developed at the same time by Voloshinov. In a series of articles between 1928 and 1930 punctuated by the appearance of the book-length *Marksizm i filosofiia iazyka* (Marxism and the Philosophy of Language) in 1929 (2nd edition 1930) Voloshinov published an analysis of the relationship between language and ideology unsurpassed for several decades. Voloshinov examines two contemporary accounts of language, what he calls 'abstract objectivism', whose leading exponent is Saussure, and 'individualistic subjectivism', developed from the work of Wilhelm von Humboldt by the romantic idealists Benedetto Croce (1866-1952) and Karl Vossler (1872-1942). Voloshinov argues that the two trends derive from rationalism and romanticism respectively and share both the strengths and weaknesses of those movements. While the former identifies the systematic and social character of language it mistakes the 'system of self-identical forms' for the source of language usage in society; it abstracts language from the concrete historical context of its utilisation (Bakhtin's 'theoreticism'); the part is examined at the expense of the whole; the individual linguistic element is treated as a 'thing' at the expense of the dynamics of speech; a unity of word meaning is assumed to the neglect of the multiplicity of meaning and accent and language is treated as a ready-made system whose developments are aberrations. The latter trend is correct in viewing language as a continuous generative process and asserting that this process is meaningful, but fundamentally wrong in identifying the laws of that creation with those of individual psychology, viewing the generative process as analogous with art and treating the system of signs as an inert crust of the creative process. These partial insights, Voloshinov argues that a stable system of linguistic signs is merely a scientific abstraction; the generative process of language is implemented in the social-verbal interaction of speakers; the laws of language generation are sociological laws; although linguistic and artistic creativity do not coincide, this creativity must be understood in relation to the ideological meanings and values that fill language and that the structure of each concrete utterance is a sociological structure.

Several commentators have noted how Voloshinov's approach to language anticipates many of the criticisms of linguistic philosophy levelled by present day Poststructuralists, but does so without invoking the relativism of much of the latter or the nullity of Derrida's '*hors texte*'. Voloshinov

firmly establishes the sign-bound nature of consciousness and the shifting nature of the language system, but instead of viewing the subject as fragmented by the reality of difference, he poses each utterance to be a microcosm of social conflict. This allows sociological structure and the plurality of discourse to be correlated according to a unitary historical development. In this sense Voloshinov's critique bears a strong resemblance to the Italian Communist leader Antonio Gramsci's account of hegemony in his *Prison Notebooks*. Like Voloshinov and Bakhtin, Gramsci drew upon the work of Croce and Vossler and Matteo Bartoli's Saussurean 'spatial linguistics', and combined it with a Hegelian reading of Marxism. As we have seen, however, Voloshinov was heavily influenced by the work of Cassirer, whose admiration for the work of von Humboldt, the founder of generative linguistics, was substantial. Voloshinov's critique thus tended towards the romantic pole of language study rather than taking up the equidistant position he claimed in his study. This can be seen in the tendency to see social groups as collective subjects rather than institutionally defined collectives and such assertions as those which suggest the meaning of a word is 'totally determined' by its context. What Voloshinov effectively does is to supplement Humboldt's recognition of individual and national linguistic variability with a sociological dimension. Humboldt's 'inner-form' of language is recast as the relationality of discourse, *dialogism*. Abandoning the Marxist distinction between base and superstructure, Voloshinov follows Cassirer and Hegel in seeing the variety of linguistic forms as expressions of a single essence. It is significant that Gramsci, who adopted a consistently pragmatist epistemology followed the same course and emerged with startlingly similar formulations.

This suggests that the relations between the work of the Bakhtin school and Marxism are ones which are complex and worthy of close scrutiny. Those who have tried to set up a Chinese wall between the two tendencies or who have tried to identify them, have consistently failed to do justice to this philosophical dialogue. Some have even gone so far as to see the work of the group as fundamentally anti-Hegelian, a charge which collapses as soon as one traces the use of terminology in the works from the late 1920s.

BAKHTIN AND THE THEORY OF THE NOVEL 1933-1941. The shift in Bakhtin's thought from Kant towards Hegel is nowhere clearer than in his central works on the novel. This can be seen in the new centrality Bakhtin grants to the *history* of literature to which Kant had been largely indifferent. As if to stress his indebtedness to German idealism, Bakhtin adopts all of the characteristics of the novel as a genre catalogued by Goethe, Schlegel and Hegel with little modification and traces how the 'essence' of the genre 'appears' over a course of time. The development of the novel is described in a way distinctly reminiscent of Cassirer's 'symbolic forms' which unfold to present their unique view of the world which is itself a modified version of Hegel's characterisation of the *Phenomenology of Spirit* as the representation of 'appearing knowledge'. At the same time, however, the novel adopts many of the features of the role of Hegel's philosophy in its Cassireran guise as the philosophy of culture. Such a philosophy, argued Cassirer, does not attempt to go behind the various image worlds created by the human spirit but 'to understand and elucidate their basic formative principle' (*The Philosophy of Symbolic Forms vol. 1, Language* p.113). The novel, according to the scheme developed by Bakhtin, elucidates this principle with regard both to other literary genres and socio-ideological discourses. The old idealist formulation of the novel's imperative that it be a 'full and comprehensive reflection of its era' is reformulated as 'the novel must represent all the ideological voices of its era... all the era's languages that have any claim to being significant' (411). The novel is a symbolic form, but a specific one in which the 'basic formative principle' of symbolic forms becomes visible. The socially stratified national

language, *heteroglossia* in itself, becomes heteroglossia *for-itself* rather as thought perceives itself as its own object at the climax of Hegel's *Phenomenology*.

The novel, for Bakhtin, uncovers the formative principle of discourse, its relationality, dialogism, without presenting some final *absolute* language of truth such as that which constitutes Hegelian conceptualism. The novel develops into something akin to a '*visio intellectualis* of the sort Cassirer found in the work of Nicholas Cusanus. This is a whole which includes all various viewpoints in its accidentiality and necessity, 'the thing seen and the manner and direction of the seeing' (Cassirer *The Individual and the Cosmos in Renaissance Philosophy* 1963, p.32). No individual perspective is adequate to the whole in itself, for only the concrete totality of perspectives can present the whole:

> **Languages of heteroglossia, like mirrors that face each other, each of which in its own way reflects a little piece, a tiny corner of the world, force us to guess at and grasp behind their inter-reflecting aspects for a world that is broader, more multi-levelled and multi-horizoned than would be available to one language, one mirror. (Bakhtin *Voprosy literatury i estetiki* pp.225-26)**

While this aspect of Bakhtin's theory of the novel is most likely based on the philosophy of Cassirer, who developed his work as a defence of liberal values in the context of an increasingly chauvinistic atmosphere in Weimar Germany, a different political slant becomes markedly more apparent in Bakhtin's work of the 1930s. The novelist now becomes the heir of an anti-authoritarian popular cultural strategy to deflate the pretensions of the official language and ideology and institute a popular-collective learning process. The antecedent of this strategy is not German bourgeois liberalism but Russian populism (*narodnichestvo*). Thus the dialectic of mythical and critical symbolic forms which Cassirer outlined in his philosophy now becomes fused with a dialectic of official and popular socio-cultural forces. On one side stand the forces of cultural centralisation and stabilisation: the 'official strata', unitary language, the literary canon and so on. On the other side stands the decentralising influence of popular culture: popular festivity and collective ridicule, literary parody, and the anti-canonic novel. The rise of the novel is correlated with the collapse of antique unity and the breaking down of cultural boundaries. Where the official culture developed a canon of poetic genres which posited a rarified language in opposition to the common spoken language, presented a monolithically serious worldview and epic accounts of a golden age and heroic beginnings, the novel parodies these features, ridiculing the official culture's claims to universal validity and the ossified conventionality of canonic forms and language.

The novel is thus a literary expression of a whole socio-cultural process, but this process is rather too broad to be incorporated under the label Bakhtin gives to it without considerable problems with regard to conceptual accuracy. The adjective *poetic* becomes shorthand for the whole complex of institutional and cultural forms which can be included on the side of officialdom. Thus *poetic* denotes both a type of discourse used in artistic texts and a hierarchical relation between discourses which constitutes the hegemonic relationships of an unequal society. Correspondingly, *novelistic* describes both the character of a genre, multi-accented artistic discourse, and an anti-authoritarian relationship between discourses. Another pair of terms which is often used interchangeably with these two is *monologic* and *dialogic*. The former denotes a mono-accentual type of discourse *and* an authoritarian stance towards another discourse. The latter describes a multi-accentual discourse, the relationality of discourse, and an orientation on a monologic discourse which seeks to reveal the ideological structure lurking behind surface appearances. The ground between formal and political terms shifts before the reader, who is constantly reminded of

the institutional co-ordinates for all discursive phenomena but is never presented with a sociological account of those co-ordinates. This might be explained both by the ideological restrictions placed on any writer in Stalin's Russia and by the idealist frame of Bakhtin's own theory. This ambiguity has allowed very different interpretations of Bakhtin's work to be drawn, ranging from a tendency to reduce the whole argument to one of artistic forms, leading to a liberalistic formal criticism and attempts to correlate Bakhtin's argument with the institutional forms of modern capitalist society. Bakhtin's work has thus become a battleground between (mainly American) liberal academics and (mainly British) anti-Stalinist Marxists.

In its classical phase, Russian populism was, according to Walicki, 'opposed to the "abstract intellectualism" of those revolutionaries who tried to teach the peasants, to impose on them the ideals of Western socialism, instead of learning what were their real needs and acting in the name of such interests and ideals of which the peasants had already become aware'. Yet it also suggested an opposition to those Second International Marxists who argued that capitalism was an unavoidable stage in the development of Russia (*The Controversy Over Capitalism* 1989 p.3). In one sense, then, it was a political ideology compatible with Third International Marxism, but in another it sought to reverse the hegemony of intellectuals over 'the people'. Bakhtin's *poet* is a hegemonic intellectual whose language relates in an authoritative fashion to the discourse of the masses, while the *novelist* aims to break and indeed reverse that hegemonic relationship. In Bakhtin's formulation, the locus of critical forces of culture is *the people*, while the mythological forces of culture emerge from the official stratum.

Many of the central works on the novel were at least partially written in response to the theory of the novel developed by Georg Lukács. Bakhtin had begun to translate Lukács' *Theory of the Novel* in the 1920s but abandoned the project upon learning that Lukács no longer liked the book but in the 1930s, when Lukács accommodated to the Stalin regime and essentially became a *right Hegelian*, his theory of the novel became canonical. Bakhtin agreed with Lukács that the novel represented the 'essence of the age' and that irony constituted a central factor of the novelistic method, but rejected the latter's assertion that unless the novel revealed the thread of rationality running through a seemingly anarchic world, i.e. presented an authoritative perspective, the author had succumbed to bourgeois decadence. Modernist formal experimentation and the dominance of parody in modernist literature Lukács found to be a reflection of 'bourgeois decay', while Bakhtin strove to reveal its popular-democratic roots. The novel should not be seen as a compensation for the restlessness of contemporary society, uncovering the assured road to progress, but the embodiment of the dynamic forces that could shape society in a popular-democratic fashion. Thus where Lukács championed epic closure, Bakhtin highlighted novelistic openendedness; where Lukács advocated a strong narrative presence, Bakhtin advocated the maximalisation of multilingual intersection and the testing of discourse. Bakhtin takes a stance against Lukács; *dialogism* becomes analogous to Hegel's *Geist*, both describing the social whole and standing in judgement over those eras in which the dialogic imperative is not realised.

CARNIVAL, HISTORY AND POPULAR CULTURE: RABELAIS, GOETHE AND DOSTOEVSKII AS PHILOSOPHERS. The high point of Bakhtin's populism can be seen in his now famous 1965 study of Rabelais and the heavily revised second edition of the 1929 Dostoevskii book (1963). The former had been composed as Bakhtin's doctoral dissertation which had been written in the late 1930s but was only prepared for publication when he emerged from obscurity in the 1960s. *Tvorchestvo Fransua Rable i narodnaia kul´tura srednevekov´ia i renessansa* (The work of François Rabelais and the Popular Culture of the Middle Ages and the Renaissance) is a

remarkable work. Bakhtin concentrates on the collapse of the strict hierarchies Middle Ages and the beginning of the Renaissance by looking at the way in which ancient modes of living and working collectively, in accordance with the rhythms of nature, re-emerge in the forms of popular culture opposed to official culture. In *Problemy poetiki Dostoevskogo* (Problems of Dostoevskii's Poetics) Bakhtin summarises the essence of the question thus:

> **It could be said (with certain reservations, of course) that a person of the Middle Ages lived, as it were, *two lives*: one that was the *official* life, monolithically serious and gloomy, subjugated to a strict hierarchical order, full of terror, dogmatism, reverence and piety; the other was the *life of the carnival square*, free and unrestricted, full of ambivalent laughter, blasphemy, the profanation of everything sacred, full of debasing and obscenities, familiar contact with everyone and everything. Both these lives were legitimate, but separated by strict temporal boundaries. (p.129-30)**

The activities of the carnival square: collective ridicule of officialdom, inversion of hierarchy, violations of decorum and proportion, celebration of bodily excess and so on embody, for Bakhtin, an implicit popular conception of the world. This conception is not, however, able to become ideologically elaborated until the radical laughter of the square entered into the 'world of great literature' (Rabelais p.96). The novel of Rabelais is seen as the epitome of this process of breaking down the rigid, hierarchical world of the Middle Ages and the birth of the modern era. Rabelais is much more than a novelist for Bakhtin: his work embodies a whole new philosophy of history, in which the world is viewed in the process of becoming. The grotesque is the image of this becoming, the boundaries between person and person, person and thing, are erased as the individual merges with the people and the whole cosmos. As the individual body is transcended, the biological body is negated and the 'body of historical, progressing mankind' moves to the centre of the system of images. In the carnival focus on death and rebirth the individual body dies, but the body of the people lives and grows, biological life ends but historical life continues.

The carnivalesque becomes a set of image-borne strategies for destabilising the official worldview. In a recently published article written for inclusion in the Soviet *Literaturnaia entsiklopediia* (Literary Encyclopaedia) in 1940, Bakhtin defines the satirical attitude as the 'image-borne negation' of contemporary actuality as inadequacy, which contains within itself a positive moment in which an improved actuality is affirmed. This affirmed actuality is the historical necessity implicit in contemporary actuality and which is implied by the grotesque image. The grotesque, argues Bakhtin, 'discloses the potentiality of an entirely different world, of another order, another way of life. It leads man out of the confines of the apparent (false) unity, of the indisputable and stable' (Rabelais p.48). The grotesque image of the body, as an image which reveals incomplete metamorphosis no longer represents itself, it represents what Hegel called the 'universal dialectic of life'.

The Renaissance birth of the historical world led to a new development in the Enlightenment. Where Rabelais was presented as the high point of Renaissance literary and philosophical development, the Enlightenment reaches one of its high points in the work of Goethe. The process dispersing the 'residue of otherworldly cohesion and mythical unity' was completed at this time, helping 'reality to gather itself together and condense into the visible whole of a new world' (*Speech Genres and Other Late Essays* p.45). The Enlightenment, argues Bakhtin in a section which draws heavily on Cassirer (the corresponding passage is *The Philosophy of the Enlightenment* p.197), should no longer be considered an a-historical era, but 'an epoch of great awakening of a sense of time, above all ... in nature and human life' (p.26). But, argues Bakhtin 'this process of preparing

for the disclosure of historical time took place more rapidly, completely, and profoundly in *literary creativity* than in the abstract philosophical, ideological views of Enlightenment thinkers' (p.26). Goethe's imagination was fundamentally *chronotopic*, he visualised time in space:

> **Time and space merge ... into an inseparable unity ... a definite and absolutely concrete locality serves at the starting point for the creative imagination... this is a piece of human history, historical time condensed into space. Therefore the plot (sum of depicted events) and the characters ... are like those creative forces that formulated and humanised this landscape, they made it a speaking vestige of the movement of history (historical time), and, to a certain degree, predetermined its subsequent course as well, or like those creative forces a given locality needs in order to organise and continue the historical process embodied in it. (p.49)**

Goethe wanted to 'bring together and unite the present, past and future with the ring of necessity' (p.39), to make the present creative. Like Rabelais, Goethe was as much a philosopher as a writer.

The same pattern of analysis shapes the 1963 version of the Dostoevskii study. Here Dostoevskii is no longer treated, as in the 1929 version, as a totally original innovator, but as the heir to a tradition rooted in popular culture. The novelist stood poised at the threshold of a new era, as the rigidly hierarchical Russian Empire was poised to give way to the catastrophic arrival of capitalist anarchy and ultimately revolution. Dostoevskii thus intersected with the threshold poetics of carnival at a different stage in its development, he sought to present the voices of his era in a 'pure simultaneity' unrivalled since Dante. In contradistinction to that of Goethe this *chronotope* was one of visualising relations in terms of space not time and this leads to a philosophical bent that is distinctly messianic:

> **Only such things as can conceivably be linked at a single point in time are essential and are incorporated into Dostoevskii's world; such things can be carried over into eternity, for in eternity, according to Dostoevskii, all is simultaneous, everything coexists.... Thus there is no causality in Dostoevskii's novels, no genesis, no explanations based on the past, on the influences of the environment or of upbringing and so forth. Every act a character commits is in the present, and in this sense is not predetermined; it is conceived of and represented by the author as free. (p.29)**

The roots of such a conception lie in carnival and, according to Bakhtin, in the carnivalised philosophical dialogues that constituted the Menippean Satire. This philosophico-literary genre reaches a new stage in Dostoevskii's work, where the roots of the novel as a genre stands out particularly clearly. One of those roots was the Socratic Dialogue, which was overwhelmed by the monologic Aristotelian treatise, but which continued to lead a subterranean life in the non-canonical minor satirical genres and then became a constitutive element of the novel form and, implicitly, literary modernism. This accounts for its philosophical importance

BAKHTIN'S LAST WORKS. In his last years Bakhtin returned to the methodological questions that had preoccupied his earlier years, though now with a rather different perspective. This began with his work on speech genres in the 1950s, though apart from this study, did not yield any sustained texts until the 1970s. Bakhtin now began to stress the dialogic character of all study in the 'human sciences', the fact that one needs to deal with another 'I' who can speak for and about his or herself in a fundamentally different way than with an inanimate and voiceless object. To this end he sought to differentiate his position from that of incipient Soviet structuralism, which adopted the 'abstract objectivist' approach to language and the constitution of the subject.

Bakhtin's approach to subjectivity is dialogic, referring to the exchange of utterances rather than narrowly linguistic, and this extends to the analysis of texts which are always intertextual, meeting and illuminating each other. Just as texts have genres, 'definite and relatively stable typical *forms of construction of the whole*' so too does speech. Thus the boundaries between complex genres such as those commonly regarded as literary and other less formalised genres should be seen as porous and flexible, allowing a dialogue of genres as well as styles.

CONCLUSION. The work of the Bakhtin circle is multifaceted and extremely pertinent to contemporary philosophical concerns. Yet their work moves beyond philosophy narrowly defined to encompass anthropology, literary studies, historiography and political theory. The vicissitudes of intellectual life in the Soviet Union have complicated assessment of the work of the circle, as has the way in which the works have been published and translated in recent years. On top of this, the works of the group have been read into a theoretical position framed by present-day concerns over poststructuralism and the fate of the subject in modern philosophy. A proper historical assessment of the work of the Bakhtin Circle will be much aided by the publication of Bakhtin's Complete Works which will appear over the next few years. This will hopefully be followed by a harmonised English translation which will facilitate an informed assessment in the English speaking world.

The work of the Bakhtin Circle are currently being published in a seven-volume Russian edition. Details of Russian and English language editions as well as a considerable amount of secondary material is available at the The Bakhtin Centre Web Site.

Cesare Beccaria (1738-1794)

LIFE. Cesare Beccaria (1738-1794) was born the eldest son in an aristocratic family and educated at a Jesuit school. In his mid twenties Beccaria became close friends with Pietro and Alessandro Verri, two brothers who formed an intellectual circle called "the academy of fists" which focused on reforming the criminal justice system. Through this group Beccaria became acquainted with French and British political philosophers, such as Hobbes, Hume, Diderot, Helvetius, Montesquieu, and Hume. At the encouragement of Pietro, Beccaria wrote *On Crimes and Punishments* (1764). Some background information was provided by Pietro, who was in the process of authoring a text on the history of torture, and Alessandro was an official at a Milan prison had first hand experience of the prison's appalling conditions. The brief work relentlessly protests against torture to obtain confessions, secret accusations, the arbitrary discretionary power of judges, the inconsistency and inequality of sentencing, using personal connections to get a lighter sentence, and the use of capital punishment for serious and even minor offenses. Almost immediately, the work was translated into French and English and went through several editions. Philosophers of the time hailed it, and several European emperors vowed to follow it. With great hesitation, Beccaria acted on an invitation to Paris to meet the great thinkers of the day. A chronically shy person, Beccaria made a poor impression at Paris and returned to Milan after three weeks. Beccaria continued to gain official recognition and held several nominal political positions in Italy. Separated from the invaluable input from his friends, though, he failed to produce another text of equal importance. Outside Italy, an unfounded myth grew that Beccaria's literary silence owed to Italian restrictions on free expression.

ON CRIMES AND PUNISHMENTS. Editions of Beccaria's text follow two distinct arrangements of the material: that by Beccaria himself, and that by French translator Andre Morellet (1765) who imposed a more systematic order to Beccaria's original text. Beccaria opens his work describing the great need for reform in the criminal justice system, and he observes how few studies there are on the subject of such reform. Throughout his work, Beccaria develops his position by appealing to two key philosophical theories: social contract and utility. Concerning the social contract, Beccaria argues that punishment is justified only to defend the social contract and to ensure that everyone will be motivated to abide by it. Concerning utility (perhaps influenced by Helvetius), Beccaria argues that the method of punishment selected should be that which serves the greatest public good.

Contemporary political philosophers distinguish between two principle theories of justifying punishment. First, the retributive approach maintains that punishment should be equal to the harm done, either literally an eye for an eye, or more figuratively which allows for alternative forms of compensation. The retributive approach tends to be retaliatory and vengeance-oriented. The second approach is utilitarian which maintains that punishment should increase the total amount of happiness in the world. This often involves punishment as a means of reforming the criminal, incapacitating him from repeating his crime, and deterring others. Beccaria clearly takes

a utilitarian stance. For Beccaria, the purpose of punishment is to create a better society, not revenge. Punishment serves to deter others from committing crimes, and to prevent the criminal from repeating his crime.

Beccaria argues that Punishment should be swift since this has the greatest deterrence value. He defends his view about the swiftness of punishment by appealing to the theory of the association of ideas (developed most notably by David Hume and David Hartley). According to associationists, if we know the rules by which the mind connects together two different ideas (such as the ideas of crime and punishment), then we can strengthen their association. For Beccaria when a punishment quickly follows a crime, then the two ideas of "crime" and "punishment" will be more quickly associated in a person's mind. Also, the link between a crime and a punishment is stronger if the punishment is somehow related to the crime. Given the fact that the swiftness of punishment has the greatest impact on deterring others, Beccaria argues that there is no justification for severe punishments. In time we will naturally grow accustomed to increases in severity of punishment, and, thus, the initial increase in severity will lose its effect. There are limits both to how much torment we can endure, and also how much we can inflict.

Beccaria touches on an array of criminal justice practices, recommending reform. For example, he argues that dueling can be eliminated if laws protected a person from insults to his honor. Laws against suicide are ineffective, and thus should be eliminated, leaving punishment of suicide to God. Bounty hunting should not be permitted since it incites people to be immoral and shows a weakness in the government. He argues that laws should be clear in defining crimes so that judges do not interpret the law, but only decide whether a law has been broken. Punishments should be in degree to the severity of the crime. Treason is the worst crime since it harms the social contract. This is followed by violence against a person or his property, and, finally, by public disruption. Crimes against property should be punished by fines. The best ways to prevent crimes are to enact clear and simple laws, reward virtue, and improve education.

AGAINST CAPITAL PUNISHMENT. In *On Crimes and Punishments* Beccaria presents one of the first sustained critiques of the use of capital punishment. Briefly, his position is that capital punishment is not necessary to deter, and long term imprisonment is a more powerful deterrent since execution is transient. He starts by describing the connection between the social contract and our right to life. Locke argued that people forfeit their right to life when they initiate a state of war with other people. Beccaria disagrees. Following Hobbes, Beccaria believes that, in the social contract, we negotiate away only the minimal number of rights necessary to bring about peace. Thus, people hold onto their right to life, and do not hand this over to the public good. Given the fact that capital punishment cannot be justified by Locke's reasoning, Beccaria argues that the only other justification is that it is either necessary or useful for public good. He contests both of these claims. For Beccaria, history shows that capital punishment fails to deter determined criminals. What we know about human nature also suggests that it has minimal deterrence value. A steady example over a long period of time is more effective in creating moral habits than is a single shocking example of an execution. Beccaria argues that perpetual slavery is a more effective deterrent than capital punishment. Since we should choose the least severe punishment which accomplishes our purpose (i.e., deterrence), then perpetual slavery is the preferred mode of punishment for the worst crimes. From the spectator's perspective, observing perpetual slavery will have a more lasting impression than capital punishment. Perpetual slavery will also seem more terrible from the vantage of the spectator, than from the criminal himself. Beccaria explains the psychology of the criminal who wishes to return to the state of nature in view of the gross inequity

between the rich and the poor. Again, perpetual slavery is the best deterrence against this motivation. Beccaria argues further that the death penalty in fact has bad effects on society by reducing their sensitivity to human suffering. Potential criminals see it as one more method of perpetuating tyranny. Although capital punishment is practiced in most countries, it is still an error which in time will become rare. He urges rulers to adopt his stance against capital punishment, and predicts that this will give them a lasting fame as peacemakers.

Behaviorism

Behaviorism is a theory in the philosophy of mind which maintains that talk of mental events should be translated into talk about observable behavior. Behaviorism parts company with dualistic traditions which hold that mind is a distinct substance from material bodies. Further, behaviorism resists attempts to define mental expressions such as "pain" in reference to introspective reports by the subject. There are different degrees of behaviorist conviction which are often described as *hard* and *soft* behaviorism. Hard behaviorism is an ontological position that immaterial minds do not exist. Soft behaviorism is the view that mental events (whether an immaterial mind exists or not) cannot be characterized independently from overt physical behaviors. There may be mental states, but methodologically scientists can explain everything without referring to mental states. Related to soft behaviorism is what is sometimes called *methodological* behaviorism, the view that the behaviorist approach is used for instrumental purposes, but mental life consists of more than behavior.

In addition to these distinctions, there are three separate schools of behaviorist thought which represent its philosophical development, particularly in the first half of the 20th century. *Psychological* or *scientific* behaviorism was championed by psychologist J. B. Watson who wanted make to psychology follow the "hard sciences" by only dealing with publicly observable features of human activity. For Watson, a true scientific account of the mind is one which rests on publicly observable stimuli and responses. The term "behavior" refers to the way in which such stimuli and responses interact. B.F. Skinner contributed to psychological behaviorism by conducting experiments which linked behaviors with many of the terms commonly use to describe mental states.

Behaviorism took a decidedly philosophical turn with logical positivists such as Carnap, Hempel, and Ayer who argued that meaningful terms about mental states must trace back to some verifiable behavior. This follows directly from the logical positivist principle of verifiability which holds that only empirically verifiable statements are meaningful. Indeed, the meaning of a statement *is* its method of verifiability. The behaviorism of logical positivism declined with the logical positivist movement itself and its problematic principle of verification.

The most philosophically important type of behaviorism, often called *logical* or *philosophical* behaviorism, is associated with Gilbert Ryle in his book, *The Concept of the Mind* (1949). Ryle begins with a critique of Cartesian dualism, which he characterizes as the ghost in the machine dogma. According to this dogma, publicly observable events are inseparably linked with physical bodies; by contrast, private events are inseparably linked with spiritual minds. For Ryle, this dogma commits a category mistake by placing "mind" in a category of "privateness" to which it does not belong. Instead, mental terms refer to the way people do things, not to private spiritual states. Ryle argues that, with the exception of pain, all of our mental states can be analyzed through our behavior, and he denies that our mental states reflect anything more than a

predictable way of acting. For instance, the belief that "it is sunny" does not correspond to any immaterial thing in one's mind. That particular belief only describes dispositions to behave in certain ways, such as wearing suntan lotion, sunbathing, and saying "it's sunny."

Central to Ryle's account is the notion of a *disposition*. A disposition in general can be illustrated in the tendency of glass is to break. Human dispositions are expressed in the form of conditional (if-then) statements. For example, the disposition of Jones to be hungry might be expressed in the following complex conditional: IF Jones has food set before him, and it is not poisoned, and the situation is socially appropriate ... THEN Jones will eat the food. Ryle explains that the description must remain open (as represented in the ellipses above) since, for complex creatures and complex dispositions, we will never have the complete list of conditions relevant to the disposition. Most importantly, inner states are not causally relevant to explaining dispositions. Thus, to name a mental event is to make a prediction about a person's behavior given dispositions to behave in certain ways.

Behaviorism is open to several criticisms. First, we commonsensically think that mental events such as pain, seeing bright light, or hearing a song all involve more than predicted behavior. To an extent, Ryle recognizes this in the case of pain. Second, by restricting their analysis of mental events to only stimuli and dispositional responses, behaviorism may be engaged in overkill. In reacting against flaws of Cartesian dualism, other more moderate – yet thoroughly materialistic -- alternatives are available for explaining mental states. These include linking mental states with neural activity (i.e., identity theory), or explaining a given mental state in terms of its causal relation to other inner states (i.e., functionalism).

Belief

Belief is the acceptance of something as true, or thinking that something could be true. There are two distinct notions of belief: belief in x, and belief that x. Regarding *belief in*, we can *believe in* the existence, truth, or value of something, or believe in something that we think ought to be. The notion of *believe in* is usually used to designate believe in good things. For example, we believe in Jones's cheery attitude but not his selfishness. Philosophers are principally concerned with *belief that*, and describe this as doxastic belief. This kind of belief is one of several types propositional attitudes; others are thinking that x, wishing that x, and feeling that x.

There are limits to propositions in which we can believe. It is questionable as to whether an individual can believe contradictions, such as "that p exists and also that p does not exist at the same time." It is also uncertain whether a person can believe something that she knows is false or thinks is improbable. To study belief is to study its connections with long-term dispositions, actions, and inner experiences, not just the short-term idea that a person claims to accept. Other issues with belief concern how far belief is voluntary, and whether a person has a moral duty to believe certain things.

William James argued that acceptance of truth sometimes requires an act of the will which goes beyond what the facts present and is based on feelings. Belief in divine revelation is an example of this type. Ortega y Gasset thought of belief as the power behind ideas insofar as ideas need to be founded in pre-rational belief. Together, ideas and belief make *vital reason.* In contrast to this approach, William Crawford argues that one must not accept something unless all evidence supports it.

The theological use of the term *belief* is the closest to its common usage. A theologian distinguishes between two different meanings. The first is more like an opinion, which is belief in the probably of something. The second is the belief in the certainty of something. Catholic theologians distinguish between explicit and implicit belief. When someone believes a truth that she *knows*, the belief is explicit; when she believes the consequences of a truth which she cannot know, the belief becomes implicit.

Jeremy Bentham (1748-1832)

LIFE. A leading theorist in Anglo-American philosophy of law and one of the 'founders' of utilitarianism, Jeremy Bentham was born in Houndsditch, in London, on 15 February 1748. He was the son and grandson of attorneys, and his early family life was coloured by a mix of pious superstition (on his mother's side) and Enlightenment rationalism (from his father). Bentham lived during a time of major social, political and economic change. The 'industrial revolution,' with the massive economic and social shifts that it brought in its wake, the rise of the middle class, revolutions in France and America--all were reflected in Bentham's reflections on existing institutions. In 1760 Bentham entered Queen's College, Oxford and, upon graduation in 1764, studied law at Lincoln's Inn. Though qualified to practice law, he never did so. Instead, he devoted most of his life to writing on matters of legal reform--though, curiously, he made little effort to publish much of what he wrote.

Bentham spent his time in intense study, often writing some eight to twelve hours a day. While most of his best known work deals with theoretical questions in law, Bentham was an active polemicist and he was engaged for some time in developing projects that proposed various 'practical' ideas for the reform of social institutions. Although his work came to have an important influence on political philosophy, Bentham did not write any single text gave the essential principles of his views on this topic. His most important theoretical work is the *Introduction to the Principles of Morals and Legislation* (1789), in which much of his moral theory--which he said reflected 'the greatest happiness principle'--is described and developed.

In 1781, Bentham became associated with the Earl of Shelburne and, through him, came into contact with a number of the leading Whig politicians and lawyers. Although his work was admired by some, at the time Bentham's ideas were still largely unappreciated. In 1785, he briefly joined his brother Samuel, in Russia, where he pursued his writing with even more than his usual intensity, and devised a plan for the now infamous 'Panopticon'- -a model prison where all prisoners would be observable by (unseen) guards at all times--a project which he had hoped would interest the Czarina Catherine the Great. After his return to England in 1788, and for some 20 years thereafter, Bentham pursued--fruitlessly and at great expense--the idea of the panopticon. Fortunately, an inheritance received in 1796 provided him with financial stability. By the late 1790s, Bentham's theoretical work came to have a more significant place in political reform. Still, his influence was, arguably, still greater on the continent. (Bentham was made an honorary citizen of the fledgling French Republic in 1792 and his *The Theory of Legislation* was published first, in French, by his Swiss disciple, Etienne Dumont, in 1802.)

The precise extent of Bentham's influence in British politics has been a matter of some debate. While he attacked both Tory and Whig policies, both the Reform bill of 1832 (promoted by Bentham's disciple, Lord Henry Brougham) and later reforms in the century (such as the secret ballot, advocated by Bentham's friend, George Grote, who was elected to parliament in 1832) reflected Benthamite concerns. The impact of Bentham's ideas goes further still. Contemporary

philosophical and economic vocabulary (e.g., 'international,' 'maximize,' 'minimize,' and 'codification') is indebted to Bentham's proclivity for inventing terms and, among his other disciples were James Mill, and his son, John (who was responsible for an early edition of some of Bentham's manuscripts), as well as the legal theorist, John Austin.

At his death in London, on 6 June 1832, Bentham left literally tens of thousands of manuscript pages--some of which was work only sketched out, but all of which he hoped would be prepared for publication. He also left a large estate--used to finance the newly-established University College, London (for those individuals excluded from university education--i.e., non-conformists, Catholics and Jews)--and his cadaver which, *per* his instructions, was dissected, embalmed, dressed, and placed in a chair, and resides in a cabinet in a corridor of the main building of University College to this day. The Bentham Project, set up in the early 1960s at University College, has, as its aim, the publishing of a definitive, scholarly edition of Bentham's works and correspondence.

METHOD. Influenced by the '*philosophes*' of the Enlightenment (such as Beccaria, Helvétius, Diderot, D'Alembert, and Voltaire), but also by Locke and Hume, Bentham's work combined an empiricist approach with a rationalism that emphasized conceptual clarity and deductive argument. Locke's influence was primarily as the author of the *Enquiry Concerning Human Understanding*--and Bentham saw in him a model of one who emphasised the importance of reason over custom and tradition and who insisted on precision in the use of terms. Hume's influence was not so much on Bentham's method as on his account of the underlying principles of psychological associationism and on his articulation of the principle of utility which was then still often annexed to theological views.

Bentham's analytical and empirical method is especially obvious when one looks at some of his main criticisms of the law and of moral and political discourse in general. His principal target was the presence of 'fictions'--in particular, legal fictions. On his view, to consider any part or aspect of a thing in abstraction from that thing, was to run the risk of confusion or cause positive deceit. While, in some cases, such 'fictional' terms such as 'relation,' 'right,' 'power,' and 'possession' were of some use, in many cases their original warrant had been forgotten, so that they survived as the product of either prejudice or inattention. In those cases where the terms could be 'cashed out' in terms of the properties of real things, they could continue to be used but, otherwise, they were to be abandoned. Still, Bentham hoped to eliminate legal fictions as far as possible from the law--including the legal fiction that there was some original contract that explained why there was any law at all. He thought that, at the very least, clarifications and justifications could be given that avoided the use of such terms.

HUMAN NATURE. For Bentham, morals and legislation can be described scientifically, but such a description requires an account of human nature. Just as nature is explained through reference to the laws of physics, so human behaviour can be explained by reference to the two primary motives of pleasure and pain; this is the theory of psychological hedonism.

There is, Bentham admits, no direct proof of such an analysis of human motivation--though he holds that it is clear that, in acting, all people implicitly refer to it. At the beginning of the *Introduction to the Principles of Morals and Legislation*, Bentham writes that "[n]ature has placed mankind under the governance of two sovereign masters, pain and pleasure. It is for them alone to point out what we ought to do, as well as to determine what we shall do. On the one hand the

standard of right and wrong, on the other the chain of causes and effects, are fastened to their throne. They govern us in all we do, in all we say, in all we think: every effort we can make to throw off our subjection, will serve but to demonstrate and confirm it". From this we see that, for Bentham, pleasure and pain serve not only as explanations for action, but also define one's good. It is, in short, on the basis of pleasures and pains, which can exist only in individuals, that Bentham thought one could construct a calculus of value.

Related to this fundamental hedonism is a view of the individual as exhibiting a natural rational self-interest-- a psychological egoism. In his "Remarks on Bentham's Philosophy," (1833) Mill cites Bentham's *The Book of Fallacies* (London: Hunt, 1824, pp. 392-3) that "[i]n *every* human breast... self-regarding interest is predominant over social interest; each person's own individual interest over the interests of all other persons taken together." Fundamental to the nature and activity of individuals, then, is their own well-being, and reason--as a natural capability of the person--is considered to be subservient to this end.

Bentham believed that the nature of the human person can be adequately described without mention of social relationships. To begin with, the idea of "relation" is but a "fictitious entity", though necessary for 'convenience of discourse.' And, more specifically, he remarks that "the community is a fictitious body," and it is but "the sum of the interests of the several members who compose it". Thus, the extension of the term 'individual' is, in the main, no greater and no less than the biological entity. Bentham's view, then, is that the individual--the basic unit of the social sphere--is an "atom" and there is no 'self' or 'individual' greater than the human individual. A person's relations with others--even if important--are not essential and describe nothing that is, strictly speaking, necessary to its being what it is.

Finally, the picture of the human person presented by Bentham is based on a psychological associationism indebted to David Hartley and David Hume; Bentham's analysis of 'habit' (which is essential to his understanding of society and, especially, political society) particularly reflects associationist presuppositions. On this view, pleasure and pain are objective states and can be measured in terms of their intensity, duration, certainty, proximity, fecundity and purity. This allows, then, both for an objective determination of an activity or state and for a comparison with others.

Bentham's understanding of human nature reveals, in short, not only a psychological and ontological, but a moral, individualism where, to extend the critique of utilitarianism made by Graeme Duncan and John Gray, ("The Left Against Mill," in *New Essays on John Stuart Mill and Utilitarianism*, Eds. Wesley E. Cooper, Kai Nielsen and Steven C. Patten, 1979) "the individual human being is conceived as the source of values and as himself the supreme value."

MORAL PHILOSOPHY. As Elie Halévy notes, there are three principal characteristics of which constitute the basis of Bentham's moral and political philosophy: the greatest happiness principle, universal egoism and the artificial identification of one's interests with those of others. Though these characteristics are present throughout his work, they are particularly evident in the *Introduction to the Principles of Morals and Legislation*, where Bentham is concerned with articulating rational principles that would provide a basis, and guide, for legal, social and moral reform.

To begin with, Bentham's moral philosophy reflects what he calls at different times 'the greatest happiness principle' or 'the principle of utility'--a term which he borrows from Hume. In adverting

to this principle, however, he was not referring to just the usefulness of things or actions, but to the extent to which these things or actions promote the general happiness. Specifically, then, what is morally obligatory is that which produces the greatest amount of happiness for the greatest number of people, happiness being determined by reference to the presence of pleasure and the absence of pain. Thus, Bentham writes, "By the principle of utility is meant that principle which approves or disapproves of every action whatsoever, according to the tendency which it appears to have to augment or diminish the happiness of the party whose interest is in question: or, what is the same thing in other words, to promote or to oppose that happiness." And Bentham emphasises that this applies to "every action whatsoever." That which does not maximize the greatest happiness (such as an act of pure ascetic sacrifice) is, therefore, morally wrong. (Unlike some of the previous attempts at articulating a universal hedonism, Bentham's approach is thoroughly naturalistic.)

Bentham's moral philosophy, then, clearly reflects his psychological view that the primary motivators in human beings are pleasure and pain. Bentham admits that his version of the principle of utility is something that does not admit of direct proof--but he notes that this is not a problem as some explanatory principles do not admit of any such proof, and all explanation must start somewhere. But this, by itself, does not explain why another's happiness--or the general happiness--should count. And, in fact, he provides a number of suggestions that could serve as answers to the question of why we should be concerned with the happiness of others.

First, Bentham says, the principle of utility is something to which individuals, in acting, refer either explicitly or implicitly--and this is something that can be ascertained and confirmed by simple observation. Indeed, Bentham held that all existing systems of morality can be "reduced to the principles of sympathy and antipathy"--which is precisely that which defines utility. A second argument found in Bentham is that, if pleasure is the good, then it is good irrespective of whose pleasure it is. Thus, a moral injunction to pursue or maximize pleasure has force independently of the specific interests of the person acting. Bentham also suggests that individuals would reasonably seek the general happiness simply because the interests of others are inextricably bound up with their own--though he recognised that this is something that is easy for individuals to ignore. Nevertheless, Bentham envisages a solution to this as well. Specifically, he proposes that making this identification of interests obvious and, when necessary, bringing diverse interests together, would be the responsibility of the legislator.

Finally, there are, Bentham held, advantages to a moral philosophy based on a principle of utility. To begin with, the principle of utility is (compared to other moral principles) clear, allows for objective and disinterested public discussion, and enables decisions to be made where there seem to be conflicts of (*prima facie*) legitimate interests. Moreover, in calculating the pleasures and pains involved in carrying out a course of action-- the 'hedonic calculus'--there is a fundamental commitment to human equality. The principle of utility presupposes that 'one man is worth just the same as another man' and so there is a guarantee that, in calculating the greatest happiness "each person is to count for one and no one for more than one."

For Bentham, then, there was no inconsistency between his psychological hedonism and egoism, and the greatest happiness principle. Thus, moral philosophy or ethics can be simply described as "the art of directing men's action to the production of the greatest possible quantity of happiness, on the part of those whose interest is in view".

POLITICAL PHILOSOPHY. Bentham was regarded as the central figure of a group of intellectuals called, by Elie Halévy, "the philosophic radicals"; both J. S. Mill and Herbert Spencer can be counted among the 'spiritual descendants' of this group. While it would be too strong to claim that the ideas of the philosophic radicals reflected a common political theory, it is nevertheless correct to say that they agreed that many of the social problems of late eighteenth and early nineteenth century England were due to an antiquated legal system and to the control of the economy by a hereditary landed gentry opposed to modern capitalist institutions. As discussed in the preceding section, for Bentham, the principles that govern morals also govern politics and law, and political reform required a clear understanding of human nature. While he develops a number of principles already present in Anglo-Saxon political philosophy, he breaks with that tradition in significant ways.

In his earliest work, *A Fragment on Government* (1776) (an excerpt from a longer work published only in 1928 as *Comment on Blackstone's Commentaries*), Bentham attacked the legal theory of Sir William Blackstone. Bentham's target was, primarily, Blackstone's defense of tradition in law. Bentham advocated the rational revision of the legal system, a restructuring of the process of determining responsibility and of punishment and a more extensive freedom of contract. This, he believed, would favour not only the development of the community, but the personal development of the individual.

Bentham's attack on Blackstone targeted more than the latter's use of tradition, however. Against Blackstone and against a number of earlier thinkers, including Locke, Bentham repudiated many of the concepts underlying their political philosophies, such as natural right, state of nature, and 'social contract'. Bentham's work, then, attempted to outline positive alternatives to the preceding 'traditionalisms.' Not only did he work to reform and restructure existing institutions but he promoted broader suffrage and self (i.e., representative) government.

Law, Liberty and Government: The notion of liberty present in Bentham's account is what is now generally referred to as 'negative' liberty--freedom from external restraint or compulsion. Bentham says that "[l]iberty is the absence of restraint" and, so, to the extent that one is not hindered by others, one has liberty and is 'free'. Bentham denies that liberty is 'natural' (in the sense of existing 'prior to' social life and as thereby imposing limits on the state) or that there is an *a priori* sphere of liberty in which the individual is sovereign. In fact, Bentham holds that people have always lived in society, and so there can be no state of nature (though he does distinguish between political society and 'natural society') and no 'social contract' (a notion which he held was not only unhistorical but pernicious). Nevertheless, he does note that there is an important distinction between one's public and private life that has morally significant consequences, and he holds that liberty is a good--that, even though it is not something that is a fundamental value, it reflects the greatest happiness principle.

Correlative with this account of liberty, Bentham (as Hobbes before him) viewed law as 'negative.' Given that pleasure and pain are fundamental to--indeed, provide--the standard of value for Bentham, liberty, because 'pleasant', was a good and its restriction, because 'painful', was an evil. Law, which is by its very nature a restriction of liberty and painful to those whose freedom is restricted, is a *prima facie* evil. It is only so far as control by the state is limited that the individual is free. Law is, Bentham recognized, necessary to social order and good laws are clearly essential to good government. Indeed, perhaps more than Locke, Bentham saw the positive role to be played by law and government, particularly in achieving community well-being. To the extent that law advances and protects one's economic and personal goods, and that what government there is, is

self- government, law reflects the interests of the individual.

Unlike many earlier thinkers, Bentham held that law is not rooted in a 'natural law' but is simply a command an expression of the will of the sovereign. (This account of law, later developed by Austin, is characteristic of legal positivism.) Thus, a law that commands morally questionable or morally evil actions, or that is not based on consent, is still 'law.'

Rights: Bentham's views on rights are, perhaps, best known through the attacks on the concept of 'natural rights' that appear throughout his work. These criticisms are especially developed in his *Anarchical Fallacies* (a polemical attack on the declarations of rights issued in France during the French Revolution), written between 1791 and 1795, but not published until 1816, in French. Bentham's criticisms here are rooted in his understanding of the nature of law. Rights are created by the law, and law is simply a command of the sovereign. The existence of law and rights, therefore, requires government. Rights are also usually (though not necessarily) correlative with duties determined by the law and, as in Hobbes, are either those which the law explicitly gives us, or those where, within a legal system, the law is silent. The view that there could be rights, not based on sovereign command, and which pre-exist the establishment of government, is rejected.

According to Bentham, then, the term 'natural right' is a "perversion of language." It is "ambiguous," "sentimental" and "figurative" and it has anarchical consequences. At best, such a 'right' may tell us what we ought to do; it cannot serve as a legal restriction on what we can or cannot do. The term 'natural right' is ambiguous, Bentham says, because it suggests that there are general rights--that is, rights over no specific object--so that one would have a claim on whatever one chooses. The effect of exercising such a universal, natural 'right' would be to extinguish the right altogether, since "what is every man's right is no man's right." No legal system could function with such a broad conception of rights. Thus, there cannot be any general rights in the sense suggested by the French declarations.

The notion of 'natural rights' is, moreover, figurative. Properly speaking, there are no rights anterior to government. The assumption of the existence of such rights, Bentham says, seems to be derived from the theory of the social contract. Here, individuals form a society and choose a government through the alienation of certain of their `rights'. But such a doctrine is not only unhistorical, according to Bentham, it does not even serve as a useful fiction to explain the origin of political authority. Governments arise by habit or by force and, for contracts (and, specifically, some 'original contract') to bind, there must already be a government in place to enforce them .

Finally, the idea of a natural right is "anarchical." Such a right, Bentham claims, entails a freedom from all restraint and, in particular, from all legal restraint. Since a natural right would be anterior to law, it could not be limited by law and, since human beings are motivated by self interest, if everyone had such freedom, the result would be pure anarchy. To have a right in any meaningful sense entails that others cannot legitimately interfere with one's rights, and this implies that rights must be capable of enforcement. Such restriction, as noted earlier, is the province of the law.

Bentham concludes, therefore, that the term "[n]atural rights is simple nonsense: natural and imprescriptible rights, rhetorical nonsense,--nonsense upon stilts." Rights--what Bentham calls "real" rights--then, are fundamentally legal rights. All rights must be legal and specific (that is, having both a specific object and subject). They ought to be made because of their conduciveness to "the general mass of felicity" and, correlatively, when their abolition would be to the advantage of society, rights ought to be abolished. So far as rights exist in law, they are protected; outside of law,

they are at best "reasons for wishing there were such things as rights." While Bentham's essays against natural rights are largely polemical, many of his objections continue to be influential in contemporary political philosophy.

Nevertheless, Bentham did not dismiss talk of rights altogether. There are some services that are essential to the happiness of human beings and that cannot be left to others to fulfill as they see fit, and so these individuals must be compelled, on pain of punishment, to fulfill them. They must, in other words, respect the rights of others. Thus, although Bentham was generally suspicious of the concept of 'right,' he does allow that the term is useful and, in such work as *A General View of a Complete Code of Laws*, he enumerates a large number of rights. While the meaning he assigns to these 'rights' is largely stipulative rather than descriptive, they clearly reflect principles defended throughout his work.

There has been some debate over the extent to which the rights that Bentham defends are based on, or reducible to, duties or obligations, whether he can consistently maintain that such duties or obligations are based on the principle of utility, and whether the existence of what Bentham calls 'permissive rights'--rights one has where the law is silent--is consistent with his general utilitarian view. (This latter point has been discussed at length by H.L.A. Hart and David Lyons.)

BIBLIOGRAPHY OF BENTHAM'S WORKS.

- **The standard edition of Bentham's writings is *The Works of Jeremy Bentham*, (ed. John Bowring), London, 1838-1843; Reprinted New York, 1962. The contents are as follows:**
  - **Volume 1: Introduction; *An Introduction to the Principles of Morals and Legislation*; *Essay on the Promulgation of Laws, Essay on the Influence of Time and Place in matters of Legislation, A Table of the Springs of Action, A Fragment on Government: or A Comment on the Commentaries; Principles of the Civil Code*; *Principles of Penal law***
  - **Volume 2: *Principles of Judicial Procedure, with the outlines of a Procedural Code*; *The Rationale of Reward*; *Leading Principles of A Constitutional Code, for any state*; *On the Liberty of the Press, and public discussion; The Book of Fallacies, from unfinished papers*; *Anarchical Fallacies*; *Principles of International Law*; *A Protest Against law taxes*; *Supply without Burden*; *Tax with Monopoly*.**
  - **Volume 3: *Defence of Usury*; *A Manual of Political Economy*; *Observations on the Restrictive and Prohibitory Commercial System*; *A Plan for saving all trouble and expense in the transfer of stock*; *A General View of a Complete Code of Laws*; *Pannomial Fragments*; *Nomography, or the art of inditing laws*; *Equal Dispatch Court Bill*; *Plan of parliamentary Reform, in the form of a catechism*; *Radical Reform Bill*; *Radicalism not Dangerous*.**
  - **Volume 4: *A View of the Hard Labour Bill*; *Panopticon, or, the inspection house*; *Panopticon versus New South Wales*; A *Plea for the Constitution*; *Draught of a Code for the Organisation of Judicial establishment in France*; *Bentham's Draught for the Organisation of Judicial establishments, compared with that of a national assembly*; *Emancipate your colonies*; *Jeremy Bentham to his fellow citizens of France, on houses of peers and Senates*; *Papers Relative to Codification and Public Instruction*; *Codification Proposal***
  - **Volume 5: *Scotch Reform*; *Summary View of the Plan of a Judiciary, under the name of***

the court of lord's delegates; *The Elements of the Art of Packing*; *"Swear Not At All,"*; *Truth versus Ashhurst; The King against Edmonds and others*; *The King against Sir Charles Wolseley and Joseph Harrison*; *Optical Aptitude Maximized, expense minimized*; *A Commentary on Mr Humphreys' Real Property Code; Outline of a Plan of a General Register of Real Property*; *Justice and Codification Petitions*; *Lord Brougham Displayed*;

- **Volume 6:** *An Introductory View of the rationale of Evidence*; *Rationale of Judicial Evidence, specially applied to English Practice*, **Books I-IV**
- **Volume 7:** *Rationale of Judicial Evidence, specially applied to English Practice*, **Books V-X**
- **Volume 8:** *Chrestomathia*; *A Fragment on Ontology*; *Essay on Logic*; *Essay on language*; *Fragments on Universal Grammar*; *Tracts on Poor Laws and pauper management*; *Observations on the Poor Bill*; *Three Tracts Relative to Spanish and Portuguese Affairs*; *Letters to Count Toreno, on the proposed penal code*; *Securities against Misrule*
- **Volume 9:** *The Constitutional Code*
- **Volume 10:** *Memoirs of Bentham*, **Chapters I-XXII**
- **Volume 11:** *Memoirs of Bentham*, **Chapters XXIII-XXVI;** *Analytical Index*

- **A new edition of Bentham's Works is being prepared by The Bentham Project at University College, University of London. This edition includes:**
  - *The correspondence of Jeremy Bentham*, **Ed. Timothy L. S. Sprigge, 10 vols., London : Athlone Press, 1968-1984. [Vol. 3 edited by I.R. Christie; Vol. 4-5 edited by Alexander Taylor Milne; Vol. 6-7 edited by J.R. Dinwiddy; Vol. 8 edited by Stephen Conway].**
  - *An Introduction to the Principles of Morals and Legislation*, **Ed. J.H. Burns and H.L.A. Hart, London: The Athlone Press, 1970.**
  - *Of laws in general*. **London: Athlone Press, 1970.**
  - *A Comment on the Commentaries and A Fragment on Government*, **Ed. J.H. Burns and H.L.A. Hart, London: The Athlone Press, 1977.**
  - *Chrestomathia*, **Ed. M. J. Smith, and W. H. Burston, Oxford/New York : Clarendon Press ; Oxford University Press, 1983.**
  - *Deontology* **; together with** *A table of the springs of action ;* **and the** *Article on Utilitarianism.* **Ed. Amnon Goldworth, Oxford/New York : Clarendon Press ; Oxford University Press, 1983.**
  - *Constitutional code : vol. I* **. Ed. F. Rosen and J. H. Burns, Oxford/New York : Clarendon Press; Oxford University Press, 1983.**
  - *Securities against misrule and other constitutional writings for Tripoli and Greece.* **Ed. Philip Schofield, Oxford/New York : Clarendon Press ; Oxford University Press, 1990.**
  - *Official aptitude maximized : expense minimized*. **Ed. Philip Schofield, Oxford : Clarendon Press, 1993.**
  - *Colonies, commerce, and constitutional law : Rid yourselves of Ultramaria and other writings on Spain and Spanish America*. **Ed. Philip Schofield, Oxford/New York : Clarendon Press ; Oxford University Press, 1995.**

George Berkeley (1685-1753)

Life and Writings. **Berkeley was born at Dysert Castle, near Thomastown, Ireland, on March 12, 1685. He studied at Trinity College Dublin and received a B.A. (1704), M.A. and fellow (1707). He filled various college offices includ ing tutor, Junior Dean, and Junior Greek Lecturer. He lived there in an atmosphere "charged with the elements of reaction against traditional scholasticism in physics and metaphysics." His *Philosophical Commentaries* (first printed in 1871 under the title *Common-Place Book*) was written from time to time during his undergraduate years as a kind of scrapbook of thoughts. The work indicates the great formative influence of Locke's *Essay* which was a text book at Trinity College, and appear s to have excited Berkeley to independent critical activity. In 1709 he published an *Essay toward a New Theory of Vision*, an examination of visual consciousness to prove that it affords no ground for belief in the reality of the objects apparently seen. In 1710 appeared a *Treatise concerning the Principles of Human Knowledge*, which presents the theory of idealism, for which he is best remembered.**

Berkeley took holy orders, and, in 1713, he left Dublin, went to London and formed acquaintances. The same year he published *Three Dialogues Between Hylas and Philonous*, a popularized and lively account of the theory of idealism as appears in his *Principles*. He visited continental Europe in 1713-14 and again in 1716-20. During this period he did little literary work. Although he made some progress with the second part of his *Principles*, the manuscript was lost in his travels and the work was never resumed. His Latin treatise *De motu* was written as he was on his way home and published in 1721. Back in England, he became concerned with what he witnessed as a nationwide decline in religion, decay of public spirit, and corrupt ion of manners. The result was his *Essay towards preventing the ruin of Great Britain,* published anonymously in 1721. That same year he returned to Ireland, earned his B.D. and D.D. (1721), and again filled college offices including Divinity Lectur er, Senior Lecturer, Hebrew Lecturer, Proctor, Dean of Dromore, and Dean of Derry.

He now became devoted to a plan of establishing a college in the Bermuda Islands, went to London to further the project in 1724, and in 1725 published *A Proposal for the Better Supplying of Churches in our Foreign Plantations, and for converting t he savage Americans to Christianity by a college to be erected in the Summer Islands, otherwise called the Isles of Bermuda*. By his enthusiasm and persuasiveness, he won many expressions of sympathy, and came to believe that the government would suppo rt the plan. In September 1728, he sailed for America and landed at Newport, Rhode Island. On arrival he bought a farm near Newport and built a house which he called "Whitehall" after the English palace. The shoreline, about a mile from the house, had a cleft in the rocks which became a retreat for writing and reflection. He helped found a philosophical society at Newport and preached there in Trinity Church, a old wooden structure. He influenced Reverend Samuel Johnson, episcopal missionary and later fi rst president of Columbia College, New York. The new world affected Berkeley's imagination and led to a set of *Verses on the prospect*

***of planting arts and learning in America*.**

Three years of waiting on funding for his project convinced him that his hopes were futile, and in February 1732 he returned to London. He published immediately *Alciphron or the Minute Philosopher*, the result of his studies in America. It is a polemic against deists whom he identifies with atheists, and designates as "minute philosophers" because of their inability to take large views of things. In 1733 appeared his *Theory of Vision, or Visual Language Vindicated and Explained*. In the f ollowing year he published *The Analyst*, in which he criticized the positions of the new mathematics which, in his view, were connected with a materialistic conception of the world. This bold attempt to carry the war into the enemy's country prompte d many pamphlets in response. In 1734 he was made bishop of Cloyne. After this, his literary work was divided between questions of social reform and religious reflection. His concern for reform is represented in *The Querist* (1735). Other writings e xpress his faith in tar-water as a universal medicine, specifically his *Siris, a Chain of Philosophical Reflections, and Inquiries concerning the Virtues of Tar-water* (1744), in which he also revises his earlier views of idealism. Berkeley lived wi th his family in Cloyne until 1752, when he went to Oxford to end his days with his son, a senior student at Christ Church.

Early Views. **Berkeley's principal metaphysical position is idealism: nothing, including material objects, exists apart from perception; external objects are ultimately collections of ideas and sensations. From his earliest writin gs in the *Philosophical Commentaries*, Berkeley's idealism is evident. There he refers to his doctrine of "the immaterial hypothesis". Only persons exist: "all other things are not so much existences as manners of the existence of persons." He antic ipates that "a mighty sect of men will oppose me," that he will be called young, and upstart, a pretender, vain; but his confidence is not shaken: "Newton begs his principles; I demonstrate mine."**

In his earliest publications, he did not openly reveal his idealism to the world. *An Essay towards a New Theory of Vision* deals with one point only: the relation between the objects of sight and those of touch. William Molyneux had once set th e problem to Locke, whether a man born blind, if he recovered his sight, would be able by sight alone to distinguish from one another a cube and a sphere, with both which he had been previously acquainted by touch. Molyneux answered his own question negat ively, and Locke agreed with his answer. Berkeley also agreed with them about the answer, but for a more fundamental reason. If extension is an idea common to sight and touch (as Locke held), then visible squareness must be the same as, or have something in common with, tangible squareness. In virtue of this, the man born blind, so soon as he is made to see, should be able to distinguish between a visible square and a visible circle, and to identify this distinction with the distinction between the square and the circle already known by touch. if he is unable to do so, it is because there is nothing in common between the visible object and the tangible. And this is Berkeley's view. "The objects of sight and touch," he says, "make, if I may so say, two set s of ideas which are widely different from each other.... A man born blind, being made to see, would at first have no idea of distance by sight: the sun and stars, the remotest objects as well as the nearer, would all seem to be in his eye, or rather in h is mind.

Much of the *Essay* is devoted to explaining the apparent immediateness with which the distance of an object is seen. But the essence of the whole consists in two propositions: (1) that the object (or ideas) of sight have nothing in common with the objects of touch, and (2) that the connection of sight and touch is "arbitrary" and learned by experience only. The connection is arbitrary; but it

is regular and constant. What we see suggests to us what we may expect to touch and handle. The whole v isible world -- as was further enforced in his *Theory of Vision or Visual Language* -- consists of a set of signs which, like a language, have for their purpose to convey a meaning; though, like the words in a language, they neither resemble nor cau se that meaning, nor have any necessary connection with it. In using sight to guide our movements we interpret the language of God.

***The Principles* and *The Three Dialogues*. Berkeley's early theory of idealism -- the version now associated with his name -- is found in his *Principles of Human Knowledge*, and *Three Dialogues Between Hylas and Philonous*. In both of these Berkeley argues that no existence is conceivable (and therefore not possible) which is not either conscious spirit or the ideas (i.e. objects) of which such spirit is conscious. Locke affirmed secondary and primar y qualities of the material world. Secondary qualities, including color and taste, do not exist apart from sensations; primary qualities exist irrespective of our knowledge. Berkeley denies this distinction, and holds that external objects exist only as t hey are perceived by a subject. Thus, the mind produces ideas, and these ideas are things; to *be*, then, is to be *perceived*. There are, however, two classes of ideas: (1) the less regular and coherent, arising in the imagination, and (2) the more vivid and permanent, learned by experience "imprinted on the senses by the Author of nature" which are the real things. According to Berkeley, matter is not an objective reality but a composition of sensible qualities existing in the mind. "No object exists apart from the mind; mind is therefore the deepest reality; it is the *prius*, both in thought and existence, if for a moment we assume the popular distinction between the two."**

Locke had attributed our ignorance of the real essence of things to the imperfection of our human faculties. He accounted for the limitations of our knowledge by reference to the practical uses which it is intended to serve and for which, in spite of its theoretical inadequacy, is entirely sufficient. In Berkeley's judgment it is not the defect of our faculties, but our misuse of them that is the cause of our ignorance of reality.

> **It is said the faculties we have are few, and those designed by nature for the support and pleasure of life, and not to penetrate into the inward essence and constitution of things.... But, perhaps, we may be too partial to ourselves in placing the fault originally in our faculties, and not rather in the wrong use we make of them.... Upon the whole, I am inclined to think that the far greater part, if not all, of those difficulties which have hitherto amused philosophers, and blocked up the way to knowled ge, are entirely owing to ourselves. We have first raised a dust, and then complain we cannot see. (*Principles*, Introduction, Sections 2, and 3).**

For Berkeley, the great obstacle to knowledge is the misuse of words, particularly the substitution of words for ideas. It is "the mist and veil of words" that has chiefly obscured from us the true nature of reality. All our ideas are really particular an d concrete; it is only because we have been content to accept words in place of ideas that we have imagined the possibility of "abstract" general ideas. Locke himself is the victim of such verbalism and abstraction; for what else is his "material substanc e" but an abstract idea, or a mere word which represents no idea at all?

Berkeley's discussion of abstract ideas in the Introduction to the *Principles* is calculated to refute Locke. For Locke, an idea is "whatsoever is the *object* of the understanding when a man thinks;

hence the term expresses "whatever is meant by *phantasm, notion, species,* or whatever it is which the mind can be employed about in thinking." For Berkeley, "idea" means an objected presented to the senses, or represented in imagination. An abstract idea, t herefore, is a contradiction in terms, since it is equivalent to an abstract image. It is impossible to imagine color in general, or a triangle which is neither equilateral, isosceles, or scalenon. While all ideas are, in themselves, particular, an idea m ay acquire generality by being used to represent other particular ideas or the element common to a number of particular ideas.

> **It is, I know, a point much insisted on, that all knowledge and demonstration are about universal notions, to which i fully agree. But then it does not appear to me that those notions are formed by abstraction in the manner premised -- *universality* , so far as I can comprehend, not consisting in the absolute, positive nature or conception of anything, but in the relation it bears to the particulars signified or represented by it; by virtue whereof it is that things, names, or notions, being in their own nature *particular*, are *rendered universal*. Thus, when I demonstrate any proposition concerning triangles, it is supposed that I have in view the universal idea of a triangle: which ought not to be understood as if I could frame an *id ea* of a triangle which was neither equilateral, nor scalenon, nor equicrural; but only that the particular triangle I consider, whether of this or that sort it matters not, doth equally stand for and represent all rectilineal triangles whatsoever, and is in that sense universal. (*Principles*, Introduction, Sect. 15)**

It is not part of Berkeley's polemical purpose in the discussion of abstract ideas to develop the realistic implications of his position, or to show how it is that an idea, in itself particular, is qualified to represent other particular ideas of the same class. The abstract terms which he is concerned to invalidate are *merely* general. Of these the best example is Locke's abstract "matter", from which all particular, and therefore all general qualities have been removed.

The reality of all external things, then, consists in the particular sensations from which they derive their names, and by which they are distinguished from one another; think away these particular ideas, and the idea of the thing vanishes with them. And if it be objected that Matter must still be postulated as the *substratum* or support of the qualities, Berkeley retorts with the question, What can be the support of ideas or sensations but percipient mind? The thing is nothing but the sum of i ts qualities; what is true of each of these qualities is true of their sum. The thing itself, so far as we can intelligently speak of it, depends for its existence upon percipient mind.

Existence of Self, Other Minds, and God.

In the *Third Dialogue between Hylas and Philonous* Berkeley anticipates Hume's criticism that the same objection which Berkeley has urged against the existence of material substance are applicable to his own conception of spiritual substance:

> **You acknowledge you have, properly speaking, no *idea* of your own soul. You even affirm that spirits are a sort of beings altogether different from ideas. Consequently that no idea can be like a spirit. We have therefore no idea of any spirit. You a dmit nevertheless that there is a spiritual Substance, although you have no idea of it; while you deny there can be such a thing as material Substance, because you have no notion or idea of it. Is this fair dealing? To act consistently, you must either ad mit Matter or**

> **reject Spirit. What say you to this?**

Berkeley's answer is that the cases differ in two all-important respects. First, the notion of matter, as the unthinking support of ideas, is "repugnant" or self contradictory, whereas "it is no repugnancy to say that a perceiving thing should be the subj ect of ideas, or an active thing the cause of them." Secondly, while "I have no reason for disbelieving the existence of Matter," "the being of my Self, that is, my own soul, mind, or thinking principle, I evidently know by reflexion." Hylas still objects :

> **Notwithstanding all you have said, to me it seems that, according to your own way of thinking, and in consequence of your own principles, it should follow that *you* are only a system of floating ideas, without any substance to support them. Words ar e not to be used without a meaning. And, as there is no more meaning in *spiritual Substance* than in *material Substance*, the one is to be exploded as well as the other.**

Berkeley's reply, in the person of Philonous, is as follows:

> **How often must I repeat, that I know or am conscious of my own being; and that *I myself* am not my ideas, but somewhat else, a thinking, active principle that perceives, knows, will,s and operates about ideas. I know that I, one and the same self, p erceive both colours and sounds: that a colour cannot perceive a sound, nor a sound a colour: that I am therefore one individual principle, distinct from colour and sound; and, for the same reason, from all other sensible things and inert ideas. But, I am not in like manner conscious either of the existence or essence of Matter. On the contrary, I know that nothing inconsistent can exist, and that the existence of matter implies an inconsistency. Farther, I know what I mean when I affirm that there is a s piritual substance or support of ideas, that is, that a spirit knows and perceives ideas. But, I do not know what is meant when it is said that an unperceiving substance hath inherent in it and supports either ideas or the archetypes of ideas. There is th erefore upon the whole no parity of case between Spirit and Matter.**

In the second place, Berkeley finds in Spirit the only real cause or power. In this case also we have no "idea", but a "notion":

> **Such is the nature of Spirit, or that which acts, that it cannot be of itself perceived, but only by the effects which it produceth.... I find I can excite ideas in my mid at pleasure, and vary and shift the scene as oft as I think fit. It is no more than *willing*, and straightway this or that idea arises in my fancy.... Thus much is certain and grounded on experience: but when we talk of unthinking agents, or of exciting ideas exclusive of volition, we only amuse ourselves with words. (*Principle s*, Sects. 27, 28)**

Similarly, the existence of other finite spirits is at least a probable inference, "if we see signs and effects indicating distinct finite agents like ourselves, and see no sign or symptom whatever that leads to a rational beli ef of Matter." The most convincing ground of belief in the existence of our fellow-men is their speaking to us, and we have the same ground for believing in the existence of God, who speaks to us in the universal sense-symbolism of Nature. The test of rea lity is externality, in the sense that the ideas are produced in our minds by no activity of our own, but by another Spirit, and produced in such a constant and uniform manner that, arbitrary as the connection between them is, we learn to predict what wil l actually happen, and find that we are living in a world that is identical with, in the sense of similar to, that of our fellow humans.The significant and interpretable character of the ideas presented to us in sense-experience points to

reason, as well as will, in its Author. The permanence and continuity that characterize our changing experience find their explanation in the reasonable constancy of the divine Will which is actively present in it all. The world is a constant creation; the infinite Spir it is ever speaking to the spirits of men.

Later Idealism: *Siris.* **Thirty-five years after the *Essay on Vision,* in the comparative quite and seclusion of his later years at Cloyne, he found time and opportunity to "weigh and revise" his earlier views. The uni on of his practical and speculative interests is illustrated in his final work, *Siris: a Chain of Philosophical Reflexions and Inquiries concerning the Virtues of Tar-water and divers other subjects connected together and arising one from another.* The work is more like a series of unconnected notes, such as we find in the youthful *Philosophical Commentaries,* than a sustained philosophical argument, and it is often difficult to separate Berkeley's own views from the mass of quotations and all usions to older writers with which its pages are crowded. Its primary concern is with the body and its ills, but its ultimate concern is with the soul.**

> **If the lute be not well tuned, the musician fails of his harmony. And, in our present condition, the operations of the mind so far depend on the right tone or good condition of its instrument, that anything which greatly contributes to preserve or recover the health of the Body is well worth the attention of the mind. These considerations have moved me to communicate to the public, the salutary virtues of Tar-water; to which I thought myself indispensably obliged by the duty every man owes to mankind. And , as effects are linked with their causes, my thoughts on this low but useful theme led to farther inquires, and those on to others; remote perhaps and speculative, but I hope not altogether useless or unentertaining.**

Living, he says, "in a remote corner among poor neighbours who for want of a regular physician have often recourse to me, I have had frequent opportunities of trial". The result of these trials of its virtues was the conviction that he had found in this s imple drug the panacea for all the bodily ills of humans. The purpose of the book is at once to describe the nature of this panacea and to develop the metaphysical and religions reflections which are suggested by the marvellous properties of a thing appar ently, and in itself, so simple and so "low".

In *Siris* Berkeley moves more in the direction of Platonic idealism than that which is seen in his *Principles* (which followed the Lockean heritage of the origin of knowledge from our senses). We find accordingly a new critique of the sen ses and a new exaltation of purely intellectual insight. Sense is only the first and lowest step in the ascent of the soul from the world to God, the meanest link in the Golden Chain that unites the finite to the infinite Spirit.

> **The perceptions of sense are gross; but even in the sense there is a difference. Though harmony and proportion are not objects of sense, yet the eye and the ear are organs which offer to the mind such materials by means whereof she may apprehend both the one and the other. By experiments of sense we become acquainted with the lower faculties of the soul; and from them, whether by a gradual evolution or ascent, we arrive at the highest. Sense supplies images to memory. These become subjects for fancy to wo rk upon. Reason considers and judges of the imaginations. And these acts of reason become new objects to the understanding. In this scale, each lower faculty is a step that leads to one above it. And the uppermost naturally leads to the Deity; which**

> **is ra ther the object of intellectual knowledge than even of the discursive faculty, not to mention the sensitive. There runs a Chain throughout the whole system of beings. In this Chain one link drags another. The meanest things are connected with the highest. (Sect. 303)**

The extreme links of this Chain are the "grossly sensible" and the "purely intelligible". His earlier distinction between the idea and the notion is now developed into the contrast between *phenomena* or *appearances* on the one hand and Ideas (in the Platonic sense) or Reality on the other. The senses, instead of being regarded as the medium of the self-revelation of the divine Spirit to the human, are condemned as veiling the divine Reality from our spirits. The mind is "depressed by the heavi ness of the animal nature to which it is chained"; we are "oppressed and overwhelmed by the senses," the world of which is a "region of darkness and dreams". Our senses at first beset and overbear our mind. Until intellect begins to dawn and cast a ray on this shadowy scene, our sensible appearances are all in all and we look no farther for realities or causes. We then perceive the "true principle of unity, identity and existence. Those beings that before seemed to constitute the whole of Being, upon taki ng an intellectual view of things, prove to be but fleeting phantoms" (Sect. 249)

While Berkeley's earlier view of reality, so far at least as the external world is concerned, was expressed in the statement that *the being of things is their perception,* the view which we find in *Siris* might rather be expressed in the statement that "the being of things is their conception". Reality, being rationally constituted, can be apprehended only by intellect or reason. "We know a thing when we understand it; and we understand it when we can interpret or tell what it signifies. Strictly, the sense knows nothing. We perceive indeed sounds by hearing, and characters by sight.But we are not therefore said to understand them" (Sect. 253).

> **As understanding perceiveth not, that is, doth not hear or see, or feel, so sense knoweth not: and although the mind may use both sense and fancy, as means whereby to arrive at knowledge, yet sense or soul, so far forth as sensitive, knoweth not: and alth ough the mind may use both sense and fancy, as a means whereby to arrive at knowledge, yet sense or soul, so far forth as sensitive, knoweth nothing. (Sect. 305)**

In such passages as these we see how Berkeley's center of speculative interests has changed from the world of the senses to that of intellect or reason, and yet how closely his later Idealism is related to his earlier doctrine of Immaterialism; how the on e is rather a development than a negation of the other. Even in the *Principles* he had insisted upon the interpretability of the data of sensation, upon their symbolic or significant character, as the feature which makes possible science, on the one hand, and the practical conduct of life. Even in the *Principles* he had insisted upon the necessity of supplementing the "idea" with the "notion", the perceptual with the conceptual apprehension of reality, holding that only through such notions ca n we apprehend relations or penetrate to spiritual substance and true causes. But his early doctrine of Immaterialism, or of the sensational character of external reality, has lost interest for him, in view of the higher truth, which now preoccupies him, of the rational constitution of the universe. In a new and deeper sense he now holds that God speaks to humans, not merely in the simple language of Vision and of Sense, but in the deeper and more intimate communication of the divine with the human Reason .

Ethics. Scholars often contend that there is no real connection between Berkeley's metaphysical position and anything he says on the subject of ethics. However, Berkeley has himself suggested that his war against abstractions migh t have been carried into the sphere of ethics as well as into that of natural philosophy and of metaphysics:

> What it is for a man to be happy, or an object good, every one may think he knows. But to frame an abstract idea of happiness, prescinded from all particular pleasure, or of goodness from everything that is good, this is what few can pretend to. So likewi se a man may be just and virtuous without having precise ideas of justice and virtue. The opinion that those and the like words stand fro general notions, abstracted from all particular persons and actions, seems to have rendered morality difficult and th e study thereof of less use to mankind. And in effect one may make a great progress in school-ethics without ever being the wiser or better man for it, or knowing how to behave himself in the affairs of life more to the advantage or himself or his neighbo urs than he did before. (Principles, Sect. 100)

Berkeley never carried out the hint here conveyed of a reform of the science of ethics on his own lines of thought about external reality. However, in the discourse on *Passive Obedience*, directed against Locke's view of sovereignty in the *Treati se of Civil Government*, he investigates the relation of our duty to the sovereign to "the principles of the Law of Nature". Here he develops the analogy between moral laws and the laws of divine government of Nature. Also, the Third Dialogue of *Alc iphron or the Minute Philosopher* is devoted to the question of the nature of virtue, and is directed against Shaftesbury's theory. While the discussion is vitiated by misrepresentation of his opponent's position, it supplies interesting suggestions as to Berkeley's ethical views.

Berlin Circle

Group of philosophers and scientists who gathered round Hans Reichenbach in late 1920s. Among its members were H. Reichenbach, K. Grelling, C. G. Hempel, D. Hilbert, R. von Mises. Berlin Circle -- its name was Die Gesellschaft für empirische Philosophie (Society for empirical philosophy) -- joined up with the Vienna Circle; together they published the journal *Erkenntnis* edit by R. Carnap and H. Reichenbach, and organized several congresses on scientific philosophy, the first of which held in Prague in 1929.

Members of Berlin Circle were particularly active in analyzing contemporary physics, especially the theory of relativity, and in developing the frequency interpretation of the probability. After the rise of Nazism, several of them emigrated from Germany. Reichenbach moved to Turkey in 1933 and to USA in 1938; Hempel to Belgium in 1934 and to USA in 1939; Grelling was killed in a concentration camp. Hence the Berlin Circle was dispersed.

See also Hempel, Reichenbach, Logical positivism.

Best Reasons Morality

The "Best Reasons" approach to moral decision making advocates a rational search for the best reasons for or against a course of action. Moral reasoning, then, parallels legal reasoning which involves collecting relevant facts, weighing arguments on both sides of the issue, and then judging. Accordingly, this view of ethics is often called the best reasons approach. Advocates of this position are Stephen Toulmin in Reason in Ethics (1950), Kurt Baier in The Moral Point of View: A Rational Basis of Et hics (1958), and James Rachels in Elements of Moral Philosophy (1993).

BAIER'S FORMULATION. The heart of Baier's position is presented in Chapter three of The Moral Point of View, titled "The Best Thing to Do." In this chapter, Baier explains that morality involves an answer to the question, "What shall I do." The answe r we give to this question is the course of action which is supported by the best reasons. Baier begins by criticizing rival interpretations of the role of reason in morality. He attacks the noncognitivist view that moral pronouncements are simply command s or orders. Instead, Baier argues that the moral question, "What shall I do?" is request for information, and not a request for orders. Baier also attacks Aristotle's account of moral reasoning, which maintains that moral reasoning involves calculating t he best means of attaining our ultimate highest good. For Baier, the moral question, "What shall I do?" requests a decision about which specific goal or good I should pursue, and not a request for the best means of attaining an ultimate goal. Plato's acco unt of a rational and intuitive moral faculty is attacked, since there is no such faculty and, strictly speaking, such a faculty would only involve a blind intuition, and not thinking through an issue. Hume's restrictive account of moral reasoning (which involves merely calculating consequences) is also attacked. Baier also considers the view of C.L. Stevenson, that moral reasoning merely means believing in certain facts which give us a desire to act. Stevenson's view fails since it improperly restricts t he notion of reason to that of desire.

For Baier, then, moral reasoning involves two features: surveying the facts, and weighing the facts. Errors of moral reasoning can occur in both of these steps: we may make mistakes in our initial survey, and we may not locate the correct considerati ons when weighing the facts. When weighing the facts, Baier notes that we typically appeal to moral principles, such as self-interest, pleasure, law and religion. Some of these principles have greater weight than others. He concludes noting that the moral conclusion we arrive at is only presumptively valid, pending future deliberations.

In theory, the advantage of Baier's approach is that we are not required to either devise or systematize lists of normative principles. We simply weigh the supporting principles and explanations as they are relevant to the moral choice under consideration. However, the best reasons approach does assume that the principles we offer have validity -- otherwise it would make no sense to appeal to them when justifying our choice of action. If we then ask why these principles have validity, we must we fall back on either consequentialist or non-consequentialist explanations. Thus, the best reasons approach may only be a disguised -- and less systematized --

consequentialist or non-consequentialist normative theory.

Henry St. John Bolingbroke(1678-1751)

LIFE. Henry St. John Bolingbroke was born in Battersea in 1678. He was educated at Eton and Oxford, after which he traveled about two years on the continent. In 1700, shortly after his return, he married the daughter of Sir Henry Winchcomb, from whom he soon separated. Up to this period, he was chiefly known for his extreme dissipation but, after entering parliament in 1701, he devoted himself to politics, joined the Tory party, and soon made himself prominent as an orator. In 1704 he was made secretary of war and retained this office until 1708 when the Whigs came into power, after which he retired from politics and applied himself to study. After resignation, Bolingbroke retained great influence as the queen's favorite counselor. On the fall of the Whig party in 1710, he was made secretary of state for foreign affairs. In 1712, he was called to the house of lords by the title of Viscount Bolingbroke and in 1713, against the wishes of nearly the entire nation, concluded the peace of Utrecht. Having previously quarreled with his old friend Harley, now the Earl of Oxford and his most powerful rival, he contrived his dismissal in July 1714. Bolingbroke immediately proceeded to form a strong Jacobite ministry in accordance with the well-known inclinations of his royal mistress, whose death a few days after threw into disorder his dangerous and unprincipled schemes. The accession of George I was a deathblow to Bolingbroke's political prospects, on August 28 he was deposed from office, in March 1715 he fled to France and, in August 1715 he was attainted. For some time he held the office of secretary of state to the Pretender, but his restless and ambitious spirit yearned for the 'large excitement' of English politics. Bolingbroke's efforts to obtain a pardon were not successful and he retired to a small estate which he had purchased near Orleans. In 1718 his first wife died and, in 1720, he married the rich widow of the Marquis de Vilette.

A prudent use of this lady's wealth enabled him to return to England in September 1724. His property was restored to him, but he was never permitted to take his seat in parliament. He therefore removed himself to his villa at Dawley, near Uxbridge, where he occasionally enjoyed the society of Swift, Pope, and others of his old friends with whom he had corresponded in his exile. It was at Dawley where Bolingbroke diversified his moral and metaphysical studies by his attacks on the ministry in his periodical the *Craftsman*, in which the letters forming his *Dissertation on Parties* first appeared. In 1735, finding his political hopes clouded forever, he went back to France and continued to live there until 1742. During his second residence abroad, he wrote his *Letters on the Study of History* in which he violently attacked the Christian religion. He died on October 1, 1751, after a long illness. His talents were brilliant and versatile; his style of writing was polished and eloquent; but his fatal lack of sincerity and honest purpose, and the low and unscrupulous ambition which made him scramble for power with a selfish indifference to national security, hindered him from looking wisely and deeply into any question. His philosophical theories are not profound, nor his conclusions solid, while his criticism of passing history is worthless.

PHILOSOPHY. Bolingbroke's philosophical writings were mostly unprinted until after his death, when David Mallet published a five-volume collection of Bolingbroke's works. The philosophical

portions of this collection display his dependence on Locke, who Bolingbroke acknowledged as his "master." Using Locke's ideas and his own, Bolingbroke attempts to explain how one attains knowledge and what its limits are, as well as asserting his own beliefs about God and religion. In doing so, he makes virulent attacks on previous philosophers such as Plato, Malebranche, and Berkley.

Following Locke, Bolingbroke distinguishes between ideas of sensation and ideas of reflection. Borrowing further from Locke, he calls these "simple ideas" and says they are the materials out of which complex ideas are made. He goes on to say that although one may not understand the process by which objects produce sensory perceptions, one can know they do so. Likewise, one may not know how the will causes action, such as the movement of an arm, but this does not hinder one from knowing it is the will which causes it. He presents these beliefs as clear and obvious and in no need of being questioned. Bolingbroke gives less power, than does Locke, to the mind concerning its ability to combine ideas within itself, putting this power in nature instead. Bolingbroke also maintains that nature (the observable world) serves as a reliable guide, and error comes when one uses one's faculties out of accordance with nature.

Bolingbroke is known for being a Deist. He asserts there is a God, and proving this by reason is possible. However, this God is not at all like humans, and Bolingbroke speaks of anthropomorphism with contempt. Instead, he says God is so dissimilar to human beings, the distance between them is unimaginable and no comparison between the two is possible. Bolingbroke uses the cosmological argument to demonstrate there is a God, but goes on to assert that this God is omnipotent and omniscient and always does what is best. (Bolingbroke even claims this is the best of all possible worlds.) In order to defend his view of God's transcendence, Bolingbroke says that while one can be certain God knows everything, one can never comprehend the way in which He knows things, and goes as far as to say God's manner of knowing cannot be understood by human beings. God's morality is equally beyond human understanding. Our moral values are based solely on our existence as social beings who cannot live lives of isolation or follow a path of pure selfishness. These morals can be discovered by reason. While they arise out of the nature of things created by God, they are in no way indicative of a divine sense of morality. God created the world, and the nature of the world determines morality. However, this nature does not reflect the character or nature of God.

Bolingbroke states Christianity was originally a "complete" and "very plain system of religion," was actually no more than the "natural religion," and Jesus did not teach anything more than could be discovered by reason. Bolingbroke expresses regret that Christian teachings did not remain at their initial, simple level, and wishes they had never been corrupted by such systems as Platonism, which he regards as the product of mere imagination. His understanding of religion furthermore denies the validity of prayer by insisting one could not come into contact with one's deity, denigrates the importance of the crucifixion in Christianity, and suggests one cannot know whether or not there is a soul which survives the death of the body.

Joseph Butler (1692-1752)

LIFE. Joseph Butler was born into a Presbyterian family at Wantage. He attended a dissenting academy, but then converted to the Church of England intent on an ecclesiastical career. Butler expressed distaste for Oxford's intellectual conventions while a student at Oriel College; he preferred the newer styles of thought, especially those of Locke, Shaftesbury and Hutcheson, leading Hume to characterize Butler as one of those "who have begun to put the science of man on a new footing, and have engaged the attention, and excited the curiosity of the public." . Butler benefited from the support of Samuel Clarke and the Talbot family.

In 1719, Butler was appointed to his first job, preacher to the Rolls Chapel in Chancery Lane, London. Butler's anonymous letters to Clarke had been published in 1716, but a selection of his Rolls sermons (1726) was the first work published under his name. These sermons are still widely read and have held the attention of secular philosophers more than any other sermons in history. Butler moved north and became rector of Stanhope in 1725. Only at this point is his life documented in any detail, and his tenure is remembered mainly for the *Analogy of Religion* (1736). Soon after publication of that work, Butler became Bishop of Bristol. Queen Caroline had died urging his preferment, but Bristol was one of the poorest sees, and Butler expressed some displeasure in accepting it. Once Butler became dean of St. Paul's in 1740, he was able to use that income to support his work in Bristol. In 1750, not long before his death, Butler was elevated to Durham, one of the richest bishoprics. The tradition that Butler declined the See of Canterbury was conclusively discredited by Norman Sykes (1936), but continues to be repeated uncritically in many reference works. Butler's famous encounter with John Wesley has only recently be reconstructed in as full detail as seems possible given the state of the surviving evidence, and we are now left with little hope of ever knowing what their actual relationship was. They disagreed, certainly, on Wesley's right to preach without a license, and on this point Butler seems entirely in the right, but Butler may have supported Wesley more than he opposed him, and Wesley seems entirely sincere in his praise of the *Analogy*.

Butler has become an icon of a highly intellectualized, even rarefied, theology, "wafted in a cloud of metaphysics," as Horace Walpole said. Ironically, Butler refused as a matter of principle to write speculative works or to pursue curiosity. All his writings were directly related to the performance of his duties at the time or to career advancement. From the Rolls sermons on, all his works are devoted to pastoral philosophy.

A pastoral philosopher gives philosophically persuasive arguments for seeing life in a particular way when such a seeing-as may have a decisive effect on practice. Butler had little interest in and only occasionally practices natural theology in the scholastic sense; his intent is rather defensive, to answer those who claim that morals and religion, as conventionally understood, may be safely disregarded. Butler tried to show, as a refutation of the practice of his day (as he perceived it) that morals and religion are natural extensions of the common way of life usually taken for granted,

and thus that those who would dispense with them bear a burden of proof they are unable to discharge. In arguing that morals and religion are favored by a presumption already acknowledged in ordinary life, Butler employs many types of appeal, at least some of which would be fallacious if used in an attempted demonstrative argument. Butler's philosophy possesses a unity often neglected by those who read him selectively.

The totality of his work addresses the questions: why be moral? why be religious? and which morality?, which religion?

HUMAN NATURE AS MADE FOR VIRTUE. Butler's argument for morality, found primarily in his sermons, is an attempt to show that morality is a matter of following human nature. To develop this argument, he introduces the notions of nature and of a system. There are, he says, various parts to human nature, and they are arranged hierarchically. The fact that human nature is hierarchically ordered is not what makes us manifestly adapted to virtue, rather it is that what Butler calls conscience is at the top of this hierarchy. Butler does sometimes refer to the conscience as the voice of God, but contrary to what is sometimes alleged, he never relies on divine authority in asserting the supremacy, the universality or the reliability of conscience. Butler clearly believes in the autonomy of the conscience as a secular organ of knowledge.

Whether the conscience judges principles, actions or persons is not clear, perhaps deliberately since such distinctions are of no practical significance. What Butler is concerned to show is that to dismiss morality is in effect to dismiss our own nature, and therefore absurd. As to which morality we are to follow, Butler seems to have in mind the common core of civilized standards. He stresses the degree of agreement and reliability of conscience without denying some differences remain. All that is required for his argument to go through is that the opponent accept in practice that conscience is the supreme authority in human nature and that we ought not to disregard our own nature.

The most significant recent challenge to Butler's moral theory is by Nicholas Sturgeon (1976), a reply to which appears in Stephen Darwall (1995).

Besides the appeal to the rank of conscience, Butler offered many other observations in his attempt to show that we are made for, i.e., especially suited to, virtue. In his famous refutation of Hobbes, one of them, he shows that benevolence is as much a part of human nature as self-love. Butler also shows how various other aspects of human nature are adapted to virtue, sometimes in surprising ways, for example, that resentment is needed to balance benevolence. He also deals forthrightly with self-deception. Only three of the fifteen sermons deal with explicitly religious themes: the sermons on the love of God and the sermon on ignorance.

HUMAN LIFE AS IN THE PRESENCE OF GOD. Butler's views on our knowledge of God are among the most frequently misstated aspects of his philosophy. Lewis White Beck's exposition (1937) of this neglected aspect of Butler's philosophy has itself been generally neglected, and both friends and foes frequently assert that Butler "assumed" that God exists. Butler never assumes the existence of God, rather, at least after his exchange with Clarke, he takes it as granted that God's existence can be and has been proved to the satisfaction of those who were party to the discussion in his time. The charge, frequently repeated since the mid-nineteenth century, that Butler's position is reversible once an opponent refuses to grant God's existence is therefore groundless. Butler does not expound any proof of God's existence, a fact that makes his identification with Cleanthes in Hume's *Dialogues* problematic, but he does endorse many such proofs, using common names rather than citing specific texts. The sermons on the love of God are rarely read today, but

they provide abundant evidence that Butler's God is not some remote deity who created the world and then lost interest in it. On the contrary, the difference that God makes to us is the difference that a lively sense of God's presence makes.

THIS LIFE AS A PRELUDE TO A FUTURE LIFE. Butler considered the expectation of a future life to be the foundation of all our hopes and fears. He does not state exactly why this is so, and most commentators have concluded that he is referring to hopes and fears regarding what will happen to us as individuals when we die. Such an intention would be contrary to Butler's general line of thought. More consonant with what Butler does say is the Platonic point that one cannot truly benefit by acting viciously and then escaping punishment. Since that is what appears to happen in this world, appearances must be denied. Secondly, and here Butler would agree with Hume, in this world there is an appearance that the superintendence of the universe is not entirely just. Given the three logical options (1) the universe is ultimately unjust, (2) contrary to appearances, this world is somehow just and (3) the universe is just, but only when viewed more broadly than we are able to see now, Butler thinks there are good practical reasons for accepting the third in practice.

The first chapter of the *Analogy* is devoted to the argument that what little we know of the nature of death is insufficient to warrant an assurance that death is the end of us, and when we lack sufficient warrant for acting on the presumption of a change, we must act on the presumption of continuance. The recurrent objection, offered by such otherwise sympathetic readers as Swinburne, is that in the physical destruction of the body, we do have sufficient warrant. Chisholm (1986) has proposed a counter to this criticism.

Butler appends to his discussion of a future life a brief essay on personal identity, and this is the only part of the *Analogy* widely read today. That it is read independently is perhaps just as well since it is difficult to see how it is related to the general argument. Butler says he needs to answer objections to personal identity continuing after death, which he certainly must do, but the view that he proposes to refute is Locke's, and Locke seemed not to see that his theory personal identity presented a problem for expectation of a future life. Locke's theory was that memory is constitutive of personal identity, and even if Butler is right in his objection to Locke's theory, he certainly needs personal memories to be retained since they are presupposed by his theory of rewards and punishments after death.

THE WORLD AS A MORAL ORDER. Butler's work is directed mainly against sceptics and those inclined toward scepticism and as an aid for those who propose to argue with sceptics. The general motivation for his work is to overcome intellectual embarrassment at accepting the received systems of morals and religion. To succeed, Butler most present a case that is plausible if not fully probative, and he must do so without resorting to an overly reductive account of morals and religion. Butler's strategy is to naturalize morals and religion. Although generally scorning scholastic methods, Butler does accept the ontological proof of God's existence, the appeal to the unity and simplicity of the soul and the distinction of natural and revealed religion. The fundamental doctrine of natural religion is the efficacy of morals, that the categories of virtue and vice already discussed in terms of human nature, have application to the larger world of nature. To some, fortune and misfortune in this world seem not to be correlated with any moral scheme, but with numerous examples, Butler shows that the world as we ordinarily experience it does have the appearance of a moral order.

Butler takes up two objections: the possibility that the doctrine of necessity is true and the familiar

problem of evil. With regard to necessity, he argues that even if such is the case, we are in no position to live in accord with necessity since we cannot see our own or others actions as entirely necessitated. Butler's approach to the problem of evil is to appeal to human ignorance, a principal theme in various aspects of his work. What Butler must show is that we do not know of the actual occurrence of any event such that it could not be part of a just world. Since he does appeal to our ignorance, Butler cannot be said to have produced a theodicy, a justification of the ways of God to us, but his strategy may show a greater intellectual integrity, and may be sufficient for his purposes.

THE CHRISTIAN SCRIPTURES AS A REVELATION. Butler's treatment of revealed religion is less satisfactory, since he had only a partial understanding of modern biblical criticism. Butler does insist on treating the Bible like any other book for critical purposes, and he maintains that if any biblical teaching appears immoral or contrary to what we know by our natural faculties, that alone is sufficient reason for seeking another interpretation of the scripture. The point of a revelation is to supplement natural knowledge, not to overrule it. Far from compromising the role of religion, this view is entailed by the fact that nature, natural knowledge and revelation all have a common source in God. It is only in the second part of his *Analogy* that Butler argues against the deists. The characterization of his work as on the whole a reply to the deists is entirely a modern invention and is not found anywhere in the first century of reactions.

Only one chapter of the *Analogy* is devoted to the "Christian evidences" of miracles and prophecy, and even there Butler confines himself to some judicious remarks on the logical character of the arguments, especially with regard to miracles. In general, Butler presents revelation as wholly consistent with, but also genuinely supplemental of, natural knowledge. Hume says he castrated his Treatise out of regards for Butler, but based on the texts that survive, there is no reason to think Hume would have gotten the better of the argument. Charles Babbage eventually showed why Hume had no valid objection to Butler.

Unfortunately, Butler's account of scripture is entirely two-dimensional. He does not doubt the point that scripture was written in terms properly applicable to a previous state of society, but he has little sense of the canonical books themselves being redactions of a multitude of oral and literary traditions and sources.

PUBLIC INSTITUTIONS AS MORAL AGENTS. In the six sermons preserved from the years he served as the Bishop of Bristol, Butler defends the moral nature of various philanthropic and political institutions of his day, and in his Charge to the Clergy at Durham, he presents a concise rationale for the Church.

BUTLER'S INFLUENCE. Ernest Mossner (1936) is still the most useful survey of Butler's influence. Mossner claims that Butler was widely read in his own time, but his evidence may be insufficient to convince some. However that may be, there is no doubt that by the late eighteenth century Butler was widely read in Scottish universities, and from the early nineteenth century at Oxford, Cambridge and many American colleges, perhaps especially because the Scottish influence was so strong in America. Butler's work impressed Hume and Wesley, and Reid, Smith and Hartley considered themselves butlerians. Butler was a great favorite of the Tractarians, but the association with them may have worked against his ultimate influence in England, especially since Newman attributed his own conversion to the Roman Church to his study of Butler. S. T. Coleridge was among the first to urge study of the sermons and to disparage the *Analogy*. The decline of interest in the *Analogy* in the late nineteenth century has never been satisfactorily

explained, but Leslie Stephen's critical work was especially influential.

The editions most frequently cited today appeared only after wide interest in Butler's *Analogy* had evaporated. The total editions are sometimes said to be countless, but this is true only in the sense that there are no agreed criteria for individuating editions. The numerous ancillary essays and study guides are still useful as evidence of how Butler was studied and understood. At its height, Butler's influence cut across protestant denominational lines and party differences in the Church of England, but serious interest in the *Analogy* is now concentrated among certain Anglican writers.

BIBLIOGRAPHY. Butler's first biography appeared in the supplement to the *Biographia Britannica* (London, 1766). The most frequently reprinted biography is by Andrew Kippis and appeared in his second edition of the *Biographia Britannica* (London, 1778-93). This second edition is often confused with the supplement to the first edition. The only full biography is Bartlett (1839).

The best modern edition of Butler's works is J.H. Bernard's, but it is a modernized text, as of 1900, and contains errors. Serious readers may consult the original editions, now available on microfilm.

Works by Butler:

- *Several Letters to the Reverend Dr. Clarke.* London: Knapton, 1716.
- *Fifteen Sermons Preached at the Rolls Chapel.* London:second edition, 1729; six sermons added in the 1749 edition.
- *Analogy of Religion, Natural and Revealed, to the Constitution and Nature.* London: Knapton, 1736.
- *Charge Delivered to the Clergy.* Durham: Lane, 1751.

Edward Caird (1835-1908)

Scottish philosopher of the latter half of the nineteenth century, Edward Caird was one of the key figures of the idealist movement that dominated British philosophy from 1870 until the mid 1920s. Best known for his studies of Kant and Hegel, Caird exercised a strong influence on the 'second generation' of idealists, such as John Watson and Bernard Bosanquet. During his long and productive life, Caird was active in university and local politics and in educational and social reform. In his two series of Gifford lectures, he developed an important ‘evolutionary' account of religion.

Edward Caird was born in Greenock, Scotland, on March 23, 1835. A younger brother of the theologian John Caird (1820-1898), Edward began his studies at the University of Glasgow (which he briefly abandoned due to ill health), later moving to Balliol College, Oxford, from which he graduated in 1863. Following his graduation, he became Tutor at Merton College, Oxford (1864-1866), but soon left for the Professorship of Moral Philosophy at Glasgow (1866-1893). There, in addition to carrying out his academic duties, Caird was active in university and local politics, and was responsible for establishing the study of political sciences at the University. Following the death of Benjamin Jowett (1817-1893), Caird returned to Oxford, where he served as Master of Balliol College until 1907. He was a founding fellow of the British Academy (1902), a corresponding member of the French Academy, and held honorary doctorates from the Universities of St Andrews (1883), Oxford (1891), Cambridge (1898) and Wales (1902).

Along with T.H. Green (1836-1882), Caird was one of the first generation of 'British idealists,' whose philosophical work was largely in reaction to the then-dominant empiricist and associationist views of Alexander Bain (1818-1903) and J.S. Mill. He had, however, an ability of literary expression which Green did not possess; he was also more inclined to discuss questions by the method of tracing the historical development of the ideas involved. But while Green died at the early age of 47, Caird enjoyed a relatively long and productive life. It is, in part, for this reason that he exercised such a strong influence--particularly on the relation of philosophy and religion--on later idealists such as John Watson (1847-1939) and Bernard Bosanquet (1848-1923). Though often considered to be 'Hegelian,' Caird was arguably more profoundly influenced by Kant--though he was far from an uncritical reader.

Caird's first major work was *A Critical Account of the Philosophy of Kant* (1877), focussing on the *Critique of Pure Reason* and the *Prolegomena to any Future Metaphysics*. It was superseded in 1889 by *The Critical Philosophy of Immanuel Kant* (two volumes) in which Caird wished to show the relation of the three Critiques and the continuity in the movement of Kant's thought. In general, Caird was convinced that, though Kant had inaugurated a new era in philosophy with his attempt to integrate the *a priori* and the *a posteriori*, he failed to carry out this task fully. It was here that Caird's idealism took over. In these volumes on Kant, Caird sought "to display in the very argument of the great metaphysician, who was supposed to have cut the world in two with a hatchet, an almost involuntary but continuous and inevitable regression towards objective organic unity." Thus, he argued that "Kantian

philosophy is only a first stage, though of course a necessary stage, in the transition of philosophy to higher forms of Idealism." (1877, p. 667)

A sympathetic exposition of Hegel's philosophy is contained in his monograph on *Hegel* (1883) and, in 1885, his *Social Philosophy and Religion of Comte* (based on a collection of articles that had been previously published in the magazine, *Contemporary Review*) appeared. In these two works, Caird critically interprets these authors on lines of his own. Concerning Comte, for example, Caird writes that there cannot be a 'religion of Humanity' that is not, at the same time, a religion of God. In his treatment of Hegel, as of Kant, Caird's purpose was to show that there is a center of unity to which the mind must come back out of all differences, however varied and alien in appearance. The analysis was preliminary to reconstruction.

Caird's way of philosophizing differed from that of many of his contemporaries. It was consistently and even obtrusively constructive. According to Caird, "the true manner of honoring a thinker is to force oneself to understand him from his own point of view," and only then "to submit his ideas to as objective an examination as possible." Thus, he seized on the truths contained in the authors with whom he dealt, and was only incidentally concerned with their errors. One of the results of this, however, was that Caird's own views are often to be found only indirectly--that is, in his exposition and commentary of the views of others.

Like many other idealists, such as D.G. Ritchie (1853-1903), Caird was concerned to show the relation of evolutionary theory to the development of thought and culture. His first set of Gifford lectures, *The Evolution of Religion* (2 volumes, 1893), deals less than his other works with an exposition of the views of other philosophers. These lectures focussed on the possibility of a science of religion and the nature of religion from Greek times, but were especially centered on the development of the Christian faith through to the Reformation. Caird shows the spiritual sense of humanity as at first dominated by the object, but constrained by its own abstractions to swing around so as to fall under the sway of the subject.

In 1904 Caird's second set of Gifford lectures, *The Evolution of Theology in the Greek Philosophers*, appeared. Here, he provides again an evolutionary account of religious conceptions (e.g., the idea of the good, the soul, God, and the relation of God to humanity) toward a 'reflective religion' or theology. The story of Greek philosophy, which Caird considered mainly (but not exclusively) in its relation to theology, was carried from Plato through Aristotle, the Stoics, and Philo, to Plotinus and--in the final lecture--to Christian theology and St. Augustine.

In general, Caird's views on religion were importantly related to his understanding of ethics, and Caird borrows from Hegel (and Goethe) the ethical idea of self sacrifice, or 'dying to live,' which was to have an important role in the work of Bosanquet. Caird consistently emphasized the importance of religion, and that a genuine metaphysics must be able to provide an account of it.

Like many of the British idealists, Caird had a strong interest in classical literature. In his two volumes of *Essays on Literature and Philosophy* (1892), he brought together critical essays on Goethe, Rousseau, Carlyle, Dante and Wordsworth, with a discussion (in Volume II) of Cartesianism (Descartes, Malbranche and Spinoza) and metaphysics.

Caird's politics were generally liberal and progressive. He supported the education of women, opposed the Anglo-Boer War (1899-1902) and, like Green, was involved in the 'university settlement' programs--particularly in Glasgow and in London--where recent university graduates and professionals

attempted to narrow the gap between social classes by living and working among and with the poor.

In 1907, Caird resigned his position as Master of Balliol, and died the following year on November 1. He is buried in St Sepulchre's Cemetery, Oxford, alongside Jowett and Green.

Capital Punishment

The applied ethics issue of capital punishment involves determining whether the execution of criminals is ever justified, and, if so under what circumstances it is permissible. Philosophical defenses of capital punishment typically draw from more general discussions of punishment. The issue of *corrective justice* in legal philosophy distinguishes between two principal theories of punishment: utilitarian and retributive. Accordingly, defenses of capital punishment are usually either utilitarian or retributive in nature. By contrast, most criticisms of capital punishment seek to expose flaws in popular justifications of capital punishment. Thus, in the absence of any good reason for executing a criminal, the critic of capital punishment concludes that the criminal should be allowed to live.

UTILITARIAN ARGUMENTS CONCERNING CAPITAL PUNISHMENT. Perhaps the most common defenses of capital punishment are on utilitarian grounds. For utilitarians, punishment in general is justified only insofar as it creates a greater balance of happiness vs. unhappiness. From the utilitarian perspective, then, capital punishment is justified if it (1) prevents the criminal from repeating his crime; or (2) deters crime by discouraging would-be offenders. For, both of these contribute to a greater balance of happiness in society. There are several immediate problems with this line of reasoning. First, the burden of proof is on the defender of capital punishment to show that the same effects could not be accomplished with less severe punishment, such as life imprisonment. This is especially pertinent since the goal of utilitarianism is to reduce as much unhappiness as possible and this entails imposing the least severe of two possible punishments when everything else is equal. Italian political theorist Cesare Beccaria (1738-1794) argues this point in *On Crimes and Punishment* (1764), one of the first systematic critiques of capital punishment from the utilitarian point of view. According to Beccaria, capital punishment is not necessary to deter, and long term imprisonment is a more powerful deterrent since execution is transient.

A second and more basic problem with utilitarian defenses of capital punishment involves the fact gathering process. Since the utilitarian is making a factual claim about the beneficial social consequences of capital punishment, then his claim should be backed by empirical evidence. In the absence of such reliable empirical evidence, the utilitarian position must be dismissed, as is the case with any unverified factual claim. "Empirical evidence" in general is of two varieties: anecdotal evidence and scientific evidence. Anecdotal evidence involves isolated observations which appear to correlate two states of affairs, which, in this case, would be (a) capital punishment, and (b) improved social conditions. Given the gravity of the issue at stake with capital punishment, namely, people's lives, anecdotal evidence is an insufficient ground for establishing a causal connection between capital punishment and improved social conditions. Instead, scientific studies are needed. Several studies have been conducted in the past few decades regarding such a connection, but, unfortunately, the methodology used on social questions of this nature is

necessarily imprecise. Ideally, a truly scientific study of the question would involve a comparison between two otherwise identical societies in which capital punishment was not used in the control group but was used in the test group. The problem, though, is that it is a practical impossibility to isolate two otherwise identical societies upon which to conduct the study. An almost endless variety of differing factors in the respective groups will make the results inconclusive. Not surprisingly, the recently conducted empirical studies in fact draw conflicting conclusions. This basic problem in the fact gathering process not only applies to the utilitarian defender of capital punishment, but also to the utilitarian critic of capital punishment who might, for example, argue that society benefits more from life imprisonment sentences.

A third problem with utilitarian justifications of punishment, as pointed out by contemporary political philosopher Adam Bedeau, concerns the ratio of innocent lives saved per execution. Perhaps, in the best possible situation, executing five of the most dangerous convicts will result in saving five innocent lives in the future. As the number of executions increases, however, the number of innocent lives saved will not increase proportionally. Eventually, it may take one thousand additional executions to save only one additional innocent life. So, eventually it must be determined how many executions justify the saving of one innocent life. This, though, is virtually impossible to determine, yet utilitarians need this information to successfully calculate the overall social benefit of capital punishment.

Finally, critics of capital punishment sometimes argue on utilitarian grounds that the expense involving executions is substantially greater than the cost of life imprisonment. The costs of appeals and legal counseling are the principal expenses. Thus, the extra financial burden of capital punishment contributes to a greater balance of unhappiness vs. happiness. There are three problems with this argument. First, such financial calculations typically do not take into account that much of the legal counseling for death row inmates is *pro bono* which does not cost the taxpayer. Second, even if this is a true description of the cost of capital punishment in the United States and other developed countries, it is not representative of the cost of criminal executions world wide. Indeed, one might reasonably expect that in many developing countries executions are substantially cheaper than life imprisonment costs. Assuming that critics of capital punishment object to its practice in any country, this argument not only lacks universal application, but might in fact be used as an argument in favor of capital punishment in countries with less expensive appeals processes. Finally, even if executing criminals is more costly than life imprisonment, it is not immediately obvious that the extra expense either contributes to a greater balance of social unhappiness or even tips the balance towards unhappiness. Society may actually be pleased with, or at least content with, the value it is getting for its capital punishment dollar.

RETRIBUTIVE ARGUMENTS CONCERNING CAPITAL PUNISHMENT. The retributive notion of punishment in general is that (a) as a foundational matter of justice, criminals deserve punishment, and (b) punishment should be equal to the harm done. In determining what counts as "punishment equal to harm," theorists further distinguish between two types of retributive punishment. First, *lex talionis* retribution involves punishment in kind and is commonly expressed in the expression "an eye for an eye." Second, *lex salica* retribution involves punishment through compensation, and the harm inflicted can be repaired by payment or atonement. Historically, capital punishment is most often associated *lex talionis* retribution. One of the most early written statements of capital punishment from the *lex talionis* or "eye for an eye" perspective is from the 18th century BCE Babylonian *Law of Hammurabi*:

> **If a builder builds a house for someone, and does not construct it properly, and the**

> **house which he built falls in and kills its owner, then that builder shall be put to death. If it kills the son of the owner, then the son of that builder shall be put to death.**

Critics of classic *lex talionis*-oriented capital punishment point out several problems with this view. First, as a practical matter, *lex talionis* retribution cannot be uniformly applied to every harm committed. The second sentence in the above quote from the *Law of Hammurabi* shows the inherent absurdity of consistent application: "If it [i.e., a collapsed house] kills the son of the owner, then the son of the builder shall be put to death." Second, as a strict formula of retribution, *lex talionis* punishment may even be inadequate. For example, if a terrorist or mass murderer kills ten people, then taking his single life is technically not punishment in kind. Third, foundational beliefs in general have the unfortunate consequence of appearing arbitrary. If a belief in *lex talionis* retribution is foundational, then, by definition, it cannot be defended by appealing to a prior set of reasons. The arbitrary nature of this is particularly clear when we see that there is an alternative retributive view of punishment which is equally foundational, yet which does not require capital punishment, namely *lex salica* retribution. Finally, critics of capital punishment argue that the true basis of retributive justifications of capital punishment is not at all foundational, but instead rooted in psychological feelings of vengeance. Even if we grant that vengeance is a natural human emotion, critics argue that it is an impulse which should be tempered, just as we do natural feelings of fear, lust, and greed. Laws about punishment, then, should not be grounded in our extreme feelings, but should instead be based on our more tempered ones. When we moderate our natural feelings of vengeance, there should be little inclination to execute criminals.

Immanual Kant offered an alternative retributive justification of capital punishment which is not rooted in vengeance. Instead, for Kant, capital punishment is based on the idea that every person is a valuable and worthy of respect because of their ability to make rational and free choices. The murder, too, is worthy of respect; we, thus, show him respect by treating him the same way he declares that people are to be treated. Accordingly, we execute the murderer. A key problem with Kant's justification of capital punishment is that it tells us what to do with only ideally rational killers, although many killers are not rational.

OTHER ARGUMENTS FOR CAPITAL PUNISHMENT. **Some standard arguments for capital punishment do not fall neatly into either the retributive or utilitarian categories. For example, John Locke's famous defense of capital punishment has both a retributive and utilitarian component. Locke argued that a person forfeits his rights when committing even minor crimes. Once rights are forfeited, Locke justifies punishment for two reasons: (1) from the retributive side, criminals deserve punishment, and, (2) from the utilitarian side, punishment is needed to protect our society by deterring crime through example. Thus, society may punish the criminal any way it deems necessary so to set an example for other would-be criminals. This includes taking away his life. Under the influence of Locke's theory of the forfeiture of rights, English law had some 200 capital offenses by 1800. Critics of Locke argue that there are alternatives to his assumption that criminals forfeit their right to life. It may be, instead, that criminals forfeit other rights (such as freedom to travel), yet the right to life is simply not forfeitable. Beccaria, for example, argued that people did not sacrifice their rights to life when entering into the social contract.**

Another defense of capital punishment is based on an analogy that capital punishment is to the political body just as self-defense is to the individual. The reasoning is that, in dangerous circumstances, the individual is justified in protecting himself by self-defense with deadly force.

Since society (or the political body) is like a large person, society, too, is justified in using deadly force through capital punishment. However, for this analogy to be a successful, it must parallel the accepted principle that self-defense with deadly force is justified only when there is no alternative open to us (such as fleeing). This means we must see whether any alternative to capital punishment is open (such as long term imprisonment). Further, the self-defense with deadly force is grounded in the moral right of self-preservation. However, only people, properly speaking, have moral rights; abstract entities and institutions such as governing bodies do not. Consequently, the analogy between capital punishment and self-defense fails it a basic level.

DIRECT ATTACKS ON CAPITAL PUNISHMENT. As noted, most arguments against capital punishment are based on exposing flaws in defenses of capital punishment. However, some are more direct attacks, such as that capital punishment should be abolished since it is undignified, inhumane, or contrary to love. Corporal punishment, such as flogging, and extreme types of capital punishment, such as burning at the stake, are no longer accepted practices because of their indignity. By parity of reasoning, capital punishment should be abolished too. However, even if we grant that capital punishment violates our duty to treat people with dignity, humanity, and love, that alone may not be a sufficient reason for abolishing the practice. Dignity, humanity and love are foundational moral goods and as such are *prima facie* in nature. That is, they are each morally binding on face value until a stronger duty emerges with which it conflicts, thereby creating a moral dilemma. Defenders of capital punishment argue that retributive justice is one such conflicting duty. For, even though we are duty bound to acknowledge a criminal's dignity, the duty of retribution is also present and is in fact outweighs the other duties.

A second direct attack on the practice of capital punishment is that, at least at present, it is virtually impossible to apply death sentences fairly. People on death row are typically poor and thus could not afford the best defense at their initial trial. They are also predominately Afro-American or Hispanic which raises larger issues of racial inequality in the US. As ethnic minorities, they are also likely to receive more strict judgments from juries than their white counterparts who commit the same crime. These considerations recently prompted a US Supreme Court Justice to change his own views on capital punishment and reject the practice. In addition to problems of class bias, the practice of capital punishment is further tainted by the tragic fact that innocent people are sometimes executed. Eliminating capital punishment not only prevents their wrongful execution, but gives them more time to to clear their names and return to society.

Rudolf Carnap (1891-1970)

Contents.

LIFE. Carnap wrote an intellectual autobiography published in *The Philosophy of Rudolf Carnap*, ed. by Paul Arthur Schillp, La Salle, Ill. : Open Court Pub. Co., 1963. That autobiography is the main source of the following biographical notes.

Rudolf Carnap was born on May 18, 1891, in Ronsdorf, Germany. In 1898, after his father's death, his family moved to Barmen, where Carnap studied at the *Gymnasium*. During the years between 1910 and 1914 he studied philosophy, physics and mathematics at the University of Jena and Freiburg. Among his teachers was neo-Kantian philosopher Bruno Bauch, with whom he studied Kantian philosophy. In his intellectual autobiography, Carnap remembers that *The Critique of Pure Reason* was carefully discussed through a whole year. Carnap was especially interested in the Kantian theory of space. In 1910, Carnap attended Gottlob Frege's lectures on logic (Frege was professor of mathematics at Jena). Carnap attended a second course by Frege in 1913 - there were only three students at that course - and a third course in 1914. During those courses, Frege explained his system of logic and some applications in mathematics. However, during those years, Carnap was mainly interested in physics; in 1913 he planned to write his dissertation on a problem of experimental physics, namely thermionic emission. World War I frustrated the project. Carnap served at the front until 1917, when he was moved to Berlin. There he studied the theory of relativity. At the time, Albert Einstein was professor of physics at the University of Berlin.

After the war, Carnap sketched a dissertation on an axiomatic system for the physical theory of space and time. He submitted the draft to physicist Max Wien, director of the Institute of Physics at the University of Jena, and to Bruno Bauch. Both found the work interesting, but Wien told

Carnap the dissertation was pertinent to philosophy, not to physics, while Bauch said it was relevant to physics. Eventually, in 1921, Carnap wrote his dissertation under the direction of Bauch. His work dealt with the theory of space from a philosophical point of view. The work - entitled *Der Raum* (*Space*) - is evidently influenced by Kantian philosophy. *Der Raum* was published in 1922 in a supplemental issue of *Kant-Studien*.

Carnap's first works were concerned with the foundations of physics; he wrote essays on causality and the theory of space-time. In 1923 he met Hans Reichenbach at a conference on philosophy held at Erlangen. Reichenbach introduced him to Moritz Schlick, professor of the theory of inductive science at Vienna. Carnap visited Schlick - and the Vienna Circle - in 1925. The following year he moved to Vienna and became assistant professor at the University of Vienna. He took part in the Vienna Circle's meetings, where he met Hans Hahn, Otto Neurath, Kurt Gödel and, in 1926, Ludwig Wittgenstein; he also met Karl Popper. He became one of the leading members of the Vienna Circle - and, of course, of logical positivism - and, in 1929, he wrote, with Hahn and Neurath, the manifesto of the Circle. In 1928 Carnap published *The Logical Structure of the World*, in which he developed a formal version of empiricism: according to him, all scientific terms are definable by means of a phenomenalistic language. The great merit of that work is the rigor with which Carnap developed his theory. In the same year he published *Pseudoproblems in Philosophy*, in which he asserted that many alleged philosophical problems are meaningless. In 1929 the Vienna Circle and the Berlin Circle - the latter was founded in 1928 by Reichenbach - organized the First Conference on Epistemology, held in Prague. In 1930, Carnap and Reichenbach founded the journal *Erkenntnis*. In the same year Carnap met Tarski, who was developing his semantical theory of truth. Carnap was also interested in mathematical logic and wrote a manual of logic, entitled *Abriss der Logistik* (1929).

In 1931, Carnap moved to Prague, where he became professor of natural philosophy at the German University. In those years, his most important contribution to logic was *The Logical Syntax of Language* (1934). In 1933, Adolf Hitler became Chancellor of Germany; two years later - in 1935 - Carnap moved to the United States, helped by Charles Morris and Willard Van Orman Quine, whom he had met in Prague in 1934. He became an American citizen in 1941.

In the years between 1936 and 1952, he was a professor at the University of Chicago (during 1940-41 he was a visiting professor at Harvard University); in 1952-54 he was a professor at the Institute for Advanced Study at Princeton and, from 1954, professor at the University of California at Los Angeles.

In the 1940s, stimulated by Tarskian model theory, Carnap became interested in semantics. During those years he wrote several books on semantics: *Introduction to Semantics* (1942), *Formalization of Logic* (1943), *Meaning and Necessity: A Study in Semantics and Modal Logic* (1947). In *Meaning and Necessity*, Carnap used semantics to explain modalities. Afterwards he thought about the structure of scientific theories: his main interests were (i) to give an account of the distinction between analytic and synthetic statements and (ii) to give a suitable formulation of the verifiability principle, that is, to find a criterion of significance appropriate to scientific language. Two other important works are "Meaning postulates" (1952) and "Observation Language and Theoretical Language" (1958). The latter states Carnap's definitive view on the analytic-synthetic distinction. "The Methodological Character of Theoretical Concepts" (1958) is an attempt to give a tentative definition of a criterion of significance for scientific language. Carnap was also interested in formal

logic (*Introduction to Symbolic Logic*, 1954) and in inductive logic (*Logical Foundations of Probability*, 1950; *The Continuum of Inductive Methods*, 1952). *The Philosophy of Rudolf Carnap*, ed. by Paul Arthur Schillp, was published in 1963; and *Philosophical Foundations of Physics*, ed. by Martin Gardner, was published in 1966. Carnap was working on the theory of inductive logic when he died on September 14, 1970, at Santa Monica, California.

(Return to Contents.)

THE STRUCTURE OF SCIENTIFIC THEORIES. A scientific theory - in Carnap's opinion - is an interpreted axiomatic formal system. It consists of:

- **a formal language, including logical and non-logical terms;**
- **a set of logical-mathematical axioms and rules of inference;**
- **a set of non-logical axioms, expressing the empirical portion of the theory;**
- **a set of meaning postulates, stating the meaning of non-logical terms; they formalize the analytic truths of the theory;**
- **a set of rules of correspondence; they give an empirical interpretation of the theory.**

Note that the set of meaning postulates and the set of rules of correspondence may be included in the set of non-logical axioms, i.e., it is not necessary that meaning postulates and rules of correspondence be explicitly stated. Indeed, meaning postulates and rules of correspondence usually are not explicitly distinguished from non-logical axioms; only one set of axioms is formulated and one of the main purposes of the philosophy of science is to show the difference between the various kinds of statements. Now I shall examine Carnap's view on different constituents of a theory.

(Return to Contents.)

THE LANGUAGE OF SCIENTIFIC THEORIES. The language consists of (i) a set of symbols and (ii) effective rules that determine whether a sequence of symbols is a well-formed formula, i.e., correct with respect to syntax. Among the symbols of the language of a scientific theory are logical and non-logical terms. The set of logical terms contains both logical symbols, e.g., connectives and quantifiers, and mathematical symbols, e.g., numbers, derivatives, and integrals. Non-logical terms are symbols denoting physical entities or properties or relations, e.g., 'blue', 'cold', 'more warm than', 'proton', 'electromagnetic field'. Non-logical terms are divided into observational terms and theoretical terms. Formulas are divided into: (i) logical statements, which do not contain non-logical terms; (ii) observational statements, which contain observational terms but no theoretical terms; (iii) purely theoretical statements, which contain theoretical terms but no observational terms and (iv) rules of correspondence, which contain both observational and theoretical terms.

Classification of statements in a scientific language

type of statement	observational terms	theoretical terms
logical statements	No	No
observational statements	Yes	No
purely theoretical statements	No	Yes
rules of correspondence	Yes	Yes

The observational language contains only logical and observational statements; the theoretical language contains logical and theoretical statements and rules of correspondence.

The distinction between observational terms and theoretical terms is a main principle of logical positivism; Carnap's view on scientific theories depends on this distinction. In his book *Philosophical Foundations of Physics* (1966), Carnap bases the distinction between observational and theoretical terms on the distinction between two kinds of scientific laws, namely empirical laws and theoretical laws.

An empirical law deals with objects or properties that can be observed or measured by means of simple procedures. Empirical laws can receive a direct confirmation by empirical observations. That is, they can be justified by observations of facts, and can be thought to be an inductive generalization of such observations. This kind of law can explain and forecast facts; it deals with facts and joins facts to facts. Ideally, an empirical law which deals with measurable physical quantities, can be discovered by means of measuring such quantities in suitable cases and then interpolating a simple curve between the measured values. For example, a physicist could measure the volume V, the temperature T and the pressure P of a gas in diverse experiments, and he could find the law PV=RT, for a suitable constant R.

On the contrary, a theoretical law is concerned with objects or properties we cannot observe or measure but we can only infer from direct observations. There is no way of justifying a theoretical law by means of direct observation, and theoretical laws are not inductive generalizations: they are hypotheses that go far beyond the experience. While an empirical law can explain and forecast facts, a theoretical law can explain and forecast empirical laws. The method of justifying a theoretical law is indirect: a scientist does not test the law itself, but he tests the empirical laws that are among its consequences.

The distinction between empirical and theoretical laws entails the distinction between observational and theoretical properties, and thus also the distinction between observational and theoretical terms. Carnap admits that the distinction is not always clear and the line of demarcation between the two kinds of terms is often arbitrary. To some extent, the distinction between observational and theoretical terms is similar to the distinction between macro-events, which are characterized by physical quantities that are constant in a large portion of space and time, and micro-events, where physical quantities change rapidly in space or time. However, in many situations, the distinction between observational and theoretical terms is clear; for example, the laws that deal with the pressure, the volume and the temperature of a gas are empirical laws and the corresponding terms are observational, while the laws of quantum mechanics are theoretical.

(Return to Contents.)

ANALYTIC AND SYNTHETIC. One of the main principles of the logical empiricism is the disintegration of the synthetic a priori. All statements can be divided into two classes: analytic a priori statements and synthetic a posteriori statements. Thus synthetic a priori statements do not exist. Now I shall briefly trace the history of Carnap's efforts to give a precise definition of the distinction between analytic and synthetic statements.

In his book *The Logical Syntax of Language*, published in 1934, Carnap studies a formal language which can express classical mathematics and scientific theories. For example, classical physics can be formulated in that language. When Carnap published *The Logical Syntax of Language*, Gödel had already published (in 1931) his work on the incompleteness of mathematics; thus Carnap was aware of the substantial difference between the two concepts of *proof* and *consequence*: some statements, in spite of being a logical consequence of the axioms of mathematics, are not provable by means of these axioms. The English version of Tarski's essay on semantics was published in 1935 (the Polish original was published in 1933); so Carnap did not know the logical theory of the semantics of a formal language. These circumstances explain the fact that Carnap, in *The Logical Syntax of Language*, gives a purely syntactic formulation of the concept of logical consequence (after the publication of Tarski's essay, the notion of logical consequence is regarded as a semantic concepts and is defined by means of model theory). However, Carnap defines a new rule of inference, now called the *omega*-rule, but formerly called the Carnap rule:

> **from premises A(1), A(2), ... , A(n), A(n+1) ,... we can infer the conclusion (*x*)A*x***

Carnap defines the notion of *logical consequence*: a statement A is a logical consequence of a set S of statements if and only if there is a proof of A based on the set S; it is admissible to use the *omega*-rule in the proof of A. The definition of the notion of *provable* is: a statement A is provable by means of a set S of statements if and only if there is a proof of A based on the set S, but the *omega*-rule is not admissible in the proof of A. Note that a formal system which admits the use of the *omega*-rule is complete, that is Gödel's incompleteness theorem does not apply to such formal systems.

Finally, Carnap defines some kinds of statements: (i) a statement is L-true if and only if is a logical consequence of the empty set of statements; (ii) a statement is L-false if and only if all statements are a logical consequence of it; (iii) a statement is analytic if and only if is L-true or L-false; (iv) a statement is synthetic if and only if is not analytic. Carnap thus defines analytic statements as logically determined statements: their truth depends on logical rules of inference and is independent of experience. That is, analytic statements are a priori; on the contrary, synthetic statements are a posteriori, because they are not logically determined.

In *Testability and Meaning* (1936), Carnap gave a very similar definition. A statement is analytic if and only if it is logically true; is self-contradictory if and only if it is logically false; otherwise the statement is synthetic. Note the fact that Carnap, in *Testability and Meaning*, used the notion of true and false; that is, he used semantic notions.

***Meaning and Necessity* was published in 1947. In this work Carnap gave a similar definition. He first defines the notion of L-true (a statement is L-true if its truth depends on semantic rules) and then defines the notion of L-false (a statements if L-false if its negation is L-true). A statement is L-determined if it is L-true or L-false; analytic statements are L-determined, while synthetic statements are not L-determined. This definition is very similar to the definition Carnap gives in *The Logical Syntax of Language*; however, in *The Logical Syntax of Language* Carnap uses only syntactic concepts, while in *Meaning and Necessity* he uses semantic concepts.**

In 1951, the American philosopher Quine published the article "Two dogmas of empiricism," in which Quine criticizes the distinction between analytic and synthetic statements. As a consequence of Quine's criticism, Carnap partially changed his point of view on this problem. Carnap's reply to

Quine was first expressed in "Meaning postulates" (1952), in which Carnap suggests that analytic statements are those which are derivable from a set of appropriate sentences that he called meaning postulates - those sentences define the meaning of non logical terms; thus the set of analytic statements is not equal to the set of logically true statements. Afterwards he wrote "Observation language and theoretical language" (1958), in which he expressed a general method of determining a set of meaning postulates for the language of a scientific theory. Carnap expressed the very same method also in his reply to Carl Gustav Hempel in *The Philosophy of Rudolf Carnap* (1963), and subsequently in *Philosophical Foundations of Physics* (1966). Now I briefly explain Carnap's method. Suppose the number of non-logical axioms is finite; let T be the conjunction of all purely theoretical axioms, let C be the conjunction of all correspondence postulates and let TC be the conjunction of T and C. The theory is equivalent to the single axiom TC. Carnap formulates the following problems: how can we find two statements, say A and R, so that A expresses the analytic portion of the theory (i.e., all consequences of A are analytic) while R expresses the empirical portion (i.e., all consequences of R are synthetic)? The empirical content of the theory is formulated by means of a Ramsey sentence, named after Frank Plumpton Ramsey (1903-1930), English philosopher, who discovered it. A Ramsey sentence is built by means of the following instructions:

1. **Replace every theoretical term in TC with a variable.**
2. **Add at the beginning of the sentence an appropriate number of existential quantifiers.**

Look at the following example. Let $TC(O_1,..,O_n,T_1,...,T_m)$ be the conjunction of T and C; in TC there are observational terms $O_1...O_n$ and theoretical terms $T_1...T_m$. The Ramsey sentence (R) is

$$EX_1...EX_m\ TC(O_1,...,O_n,X_1,...,X_m)$$

Every observational statement which is derivable from TC is also derivable from R and vice versa; that is, R expresses exactly the empirical portion of the theory. Carnap proposes the statement R -> TC as the only meaning postulate; this statement is known as the Carnap sentence. Note that every empirical statement which is derivable from the Carnap sentence is logically true, and thus the Carnap sentence lacks empirical consequences. So - according to Carnap - a statement is analytic if it is derivable from the Carnap sentence; otherwise the statement is synthetic. I list the requirements of Carnap's method: (i) non-logical axioms must be explicitly stated, (ii) the number of non-logical axioms must be finite and (iii) observational terms must be clearly distinguished from theoretical terms. **(Return to Contents.)**

MEANING AND VERIFIABILITY. Perhaps the most famous tenet of the logical empiricism is the *verifiability principle*, according to which *a synthetic statement is meaningful only if it is verifiable*. It is very interesting to trace Carnap's effort to give a logical formulation of this principle. In *The Logical Structure of the World* (1928) Carnap asserts that a statement is meaningful only if every non-logical term is explicitly definable by means of a very restricted phenomenalistic language. A few years later, Carnap realized that this thesis is untenable; a phenomenalistic language is too poor to define physical concepts. Thus he choose an objective language ("thing language") as the basic language; in this language every primitive term is a physical term. All other terms (biological, psychological, cultural) must be defined by means of basic terms. Carnap also realized that an explicit definition is often impossible. There are dispositional concepts, which can be introduced by means of reduction sentences. For example, if A, B, C and D are observational terms and Q is a dispositional concept, then

(*x*)[A*x* --> (B*x* --> Q*x*)]

(*x*)[C*x* --> (D*x* --> ~Q*x*)]

are reduction sentences for Q. In *Testability and Meaning* (1936) Carnap gives an account of the new verifiability principle: *all terms must be reducible, by means of definitions or reduction sentences, to the observational language*. This principle was proved inadequate: K. R. Popper proved not only that some metaphysical terms can be reduced to the observational language, so they fulfil Carnap's requirements, but also that some genuine physical concepts are forbidden by Carnap's version of the verifiability principle. Carnap acknowledged that criticism. In "The Methodological Character of Theoretical Concepts" (1956) Carnap gives a new criterion of significance. The definition is rather involved, so I will mention only the main philosophical properties of Carnap's new principle. First of all, the significance of a term becomes a relative concept: a term is meaningful with respect to a given theory and a given language. *The meaning of a concept thus depends on the theory in which that concept is used* - this is a very important modification in empiricism's theory of meaning. Secondly, Carnap explicitly acknowledges that some theoretical terms can be not reduced to the observational language: they acquire an empirical meaning by means of the links with other theoretical terms which are reducible. Thirdly, Carnap realizes that the principle of operationalism is too restrictive. The operationalism was formulated by Nobel-prize-winning American physicist Percy Williams Bridgman (1882-1961) in his book *The Logic of Modern Physics* (1927). According to Bridgman, every physical concept is defined by the operations a physicist uses to apply it. Bridgman asserted that the curvature of space-time, a concept used by Einstein in his general theory of relativity, is meaningless, because it is not definable by means of operations. However, Bridgman subsequently changed his philosophical point of view, and he admitted there is an indirect connection with observations. Perhaps moved by Popper's criticism, or moved by the unreasonable consequence of a strict operationalism (the exclusion of Einstein's theory of curvature of space-time from legitimate physics), Carnap changed his earlier point of view and freely admitted a very indirect connection between theoretical terms and the observational language.

PROBABILITY AND INDUCTIVE LOGIC. A variety of interpretations of probability have been proposed:

- **Classical interpretation. The probability of an event is the ratio of the favorable outcomes to the possible outcomes. Example: a die is cast; the event is "the score is five"; there are six outcomes and only one favorable; thus the probability of "the score is five" is one sixth.**
- **Axiomatic interpretation. The probability is whatever fulfils the axioms of the theory of probability. In the early 1930s, the Russian mathematician Andrei Nikolaevich Kolmogorov (1903-1987) formulated the first axiomatic system for probability.**
- **Frequency interpretation, which is now the favourite interpretation in empirical science. The probability of an event in a sequence of events is the limit of the relative frequency of that event. Example: throw a die several times and record the scores; the relative frequency of "the score is five" is about one sixth; the limit of the relative frequency is exactly one sixth.**
- **Probability as a degree of confirmation, supported by Carnap and by students of inductive logic. The probability of a statement is the degree of confirmation the empirical evidence gives to the statement. Example: the statement "the score is five" receives a partial**

confirmation by the evidence; its degree of confirmation is one sixth.

- **Subjective interpretation. The probability is a measure of the degree of belief. A special case is the theory that the probability is a fair betting quotient - this interpretation was supported by Carnap. Example: suppose you bet that the score would be five; you bet a dollar and, if you win, you will receive six dollars: this is a fair bet.**
- **Propensity interpretation, due to K. R. Popper. The probability of an event is an objective property of the event. Example: the physical properties of a die [the die is homogeneous; it has six sides; on every side there is a different number between one and six; etc] explain the fact that the limit of the relative frequency of "the score is five" is one sixth.**

Carnap devoted himself to giving an account of the probability as a degree of confirmation. The technical details of Carnap's works are very involved, so I shall only mention the most philosophically significant consequences of his research. He asserted that the probability of a statement, with respect to a given body of evidence, is a logical relation between the statement and the evidence. Thus it is necessary to build an inductive logic; that is, a logic which studies the logical relations between statements and evidence. The inductive logic would give us a mathematical method of evaluating the reliability of an hypothesis; therefore the inductive logic would give an answer to the problem raised by David Hume's analysis of induction. Of course, we cannot be sure that an hypothesis is true; but we can evaluate its degree of confirmation and we can thus compare alternative theories.

In spite of the abundance of logical and mathematical methods Carnap used in his own research on the inductive logic, he was not able to formulate a theory of the inductive confirmation of scientific laws. In fact, in Carnap's inductive logic, *the degree of confirmation of every universal law is always zero*.

Carnap tried to employ the physical-mathematical theory of thermodynamics entropy to develop a comprehensive theory of the inductive logic, but his plan remained in a sketchy state. His works on entropy were published posthumously.

MODAL LOGIC AND THE PHILOSOPHY OF LANGUAGE. The following table, which is an adaptation of a similar table Carnap used in *Meaning and Necessity*, shows the relations between modal properties such as *necessary*, *impossible*, and logical properties such as *L-true*, *L-false*, *analytic*, *synthetic*. The symbol N means "necessarily", so that Np means "necessarily p".

Modal and logical properties of statements

Modalities	Formalization	Logical status
p is necessary	Np	L-true, analytic
p is impossible	N~p	L-false, contradictory
p is contingent	~N*p* & ~N~p	Factual, synthetic
p is not necessary	~Np	Not L-true
p is possible	~N~p	Not L-false
p is not contingent	Np v N~p	L-determined, not synthetic

Carnap identifies the necessity of a statement p with its logical truth: a statement is necessary if and only if it is logically true. Thus modal properties can be defined by means of the usual logical properties of statements, Carnap asserts. Np, i.e., "necessarily p", is true if and only if p is logically true. He defines the possibility of p as "it is not necessary that not p". That is, "possibly p" is defined as ~N~p. The impossibility of p means that p is logically false. I stress that, in Carnap's opinion, every modal concept is definable by means of logical properties of statements so that modal concepts are explicable from a classical point of view (classical means "using classical logic", e.g., first order logic). Note that Carnap was aware of the fact that the symbol N is definable in the meta-language, not in the object language. Np means "p is logically true", and the last statement belongs to the meta-language; thus N is not explicitly definable in the language of a formal logic, and we cannot eliminate the term N (more precisely, we can define N only by means of another modal symbol we assume as a primitive symbol, so that at least one modal symbol is required among the primitive symbols).

Carnap's formulation of modal logic is very important from a historical point of view. Carnap gave the first semantic analysis of a modal logic, using Tarskian model theory to explain the conditions in which "necessarily p" is true. Carnap also solved the problem of the meaning of the statement (*x*)N[A*x*], where A*x* is a sentence in which the individual variable *x* occurs. Carnap showed that (*x*)N[A*x*] is equivalent to N[(*x*)A*x*] or, more precisely, he proved we can assume that equivalence without contradictions.

From a more general philosophical point of view, Carnap believes that modalities do not require a new conceptual framework; a semantic logic of language can explain the modal concepts.

The method Carnap uses in explaining modalities is a typical example of Carnap's philosophical analysis. Another interesting example is the explanation of *belief-sentences* which Carnap gave in *Meaning and necessity*. Carnap asserts that two sentences have the same *extension* if they are equivalent, i.e., if they are both true or both false. On the other hand, two sentences have the same *intension* if they are logically equivalent, i.e., their equivalence is due to the semantic rules of the language. Let A be a sentence in which another sentence occurs, say p. A is called "extensional with respect to p" if and only if the truth of A does not change if we substitute the sentence p with an equivalent sentence q. A is called "intensional with respect to p" if and only if (i) A is not extensional with respect to p and (ii) the truth of A does not change if we substitute the sentence p with a logically equivalent sentence q. Look at the following examples, due to Carnap.

- **First example. The sentence AvB is extensional with respect to both A and B; we can substitute A and B with equivalent sentences and the truth value of AvB does not change.**
- **Second example. Suppose A is true but not L-true; therefore the sentences Av~A and A are equivalent (both are true) and, of course, they are not L-equivalent. The sentence N(Av~A) is true and the sentence N(A) is false; thus N(A) is not extensional with respect to A. On the contrary, if C is a sentence L-equivalent to Av~A, then N(Av~A) and N(C) are both true: N(A) is intensional with respect to A.**

There are sentences which are neither extensional not intensional; for example, belief-sentences. Carnap's example is "John believes that D". Suppose that "John believes that D" is true; let A be a sentence equivalent to D and let B be a sentence L-equivalent to D. It is possible that the sentences "John believes that A" and "John believes that B" are false. In fact, John can believe that a sentence is true but he can believe that a logically equivalent sentence is false. To explain

belief-sentences, Carnap defines the notion of *intensional isomorphism*. Roughly speaking, two sentences are intensionally isomorphic if and only if their corresponding elements are L-equivalent. In the belief-sentence "John believes that D" we can substitute D with an intensionally isomorphic sentence C.

PHILOSOPHY OF PHYSICS. The first and the last of the books Carnap published during his life are concerned with the philosophy of physics; they are respectively the dissertation written for his doctorate (*Der Raum*, 1921, published in the following year in a supplemental issue of *Kant-Studien*) and *Philosophical Foundations of Physics*, ed. by Martin Gardner, 1966. In 1977, *Two Essays on Entropy*, ed. by Abner Shimony, was published posthumously.

***Der Raum* deals with the philosophy of space. Carnap recognizes the difference between three kinds of theories of space: formal, physical and intuitive space. Formal space is analytic a priori; it is concerned with the formal properties of the space, that is with those properties which are a logical consequence of a definite set of axioms. Physical space is synthetic a posteriori; it is the object of natural science, and we can know its structure only by means of experience. Intuitive space is synthetic a priori, and is known via a priori intuition. According to Carnap, the distinction between three different kinds of space is similar to the distinction between three different aspects of geometry: projective, metric and topological geometry, respectively.**

Some aspects of *Der Raum* are very interesting. First of all, Carnap accepts a neo-Kantian philosophical point of view. Intuitive space, with its synthetic a priori character, is a concession to Kantian philosophy. Secondly, in this work Carnap uses the methods of mathematical logic; for example, the characterization of the intuitive space is given by means of Hilbert's axioms for topology. Thirdly, the distinction between formal and physical space is similar to the distinction between mathematical and physical geometry; this distinction, proposed by Hans Reichenbach during those years, was later accepted by Carnap and became the official position of the logical empiricism on the philosophy of space.

Carnap also developed a formal system for space-time topology. He asserted (1925) that space relations are based on the causal propagation of a signal, while the causal propagation itself is based on the time order.

***Philosophical Foundations of Physics* is a survey on many aspects of the philosophy of physics; it is an excerpt from Carnap's university lessons. Some theories expressed there are not due to Carnap, but they belong to the common heritage of logical empiricism. This book is very clear and easy to understand. It employs few logical and mathematical formulas, and it is rich in examples. The following is a brief list of the subjects it deals with.**

- **The structure of scientific explanation: deductive and probabilistic explanation.**
- **Philosophical and physical significance of non-Euclidean geometry; the theory of space in the general theory of relativity. Carnap argues against Kantian philosophy, especially against the synthetic a priori, and against conventionalism. He gives a clear explanation of the main properties of non-Euclidean geometry.**
- **Determinism and quantum physics.**
- **The nature of scientific language. Carnap deals with (i) the distinction between observational**

and theoretical terms, (ii) the distinction between analytic and synthetic statements and (iii) quantitative concepts.

As an example of the content of *Philosophical Foundations of Physics* I shall briefly examine Carnap's thought on scientific explanation. Carnap accepts the classical theory due to Carl Gustav Hempel. The following example of Carnap's explains the general structure of a scientific explanation:

(*x*)(P*x* --> Q*x*)
P*a*
Q*a*

where the first statement is a scientific law, the second is a description of the initial conditions and the third is the description of the event we want to explain. The last statement is a logical consequence of the first and the second, which are the premises of the explanation. A scientific explanation is thus a logical derivation of an appropriate statement from a set of premises, which state the general laws and the initial conditions. According to Carnap, there is another kind of scientific explanation, probabilistic explanation, in which at least one universal law is not a deterministic law, but a probabilistic law. An example - due to Carnap - is:

fr(Q,P) = 0.8
P*a*
Q*a*

where the first sentence means "the relative frequency of Q with respect to P is 0.8". Qa is not a logical consequence of the premises; therefore this kind of explanation determines only a certain degree of confirmation for the event we want to explain.

(Return to Contents.)

CARNAP'S HERITAGE. Carnap's works have raised many debates. A large number of articles is devoted to a careful examination of his thought, sometimes criticizing his point of view, sometimes in defense of his philosophy. I shall mention some researches dealing with developments of Carnap's philosophy.

With respect to the analytic-synthetic distinction, Ryszard Wojcicki and Marian Przelecki - two Polish logicians - formulated a semantic definition of the distinction between analytic and synthetic; they proved Carnap sentence is the weakest meaning postulate, i.e., every meaning postulate entails the Carnap sentence. Therefore the set of analytic statements which are a logical consequence of the Carnap sentence is the smallest set of analytic statements. Wojcicki and Przelecki's research is independent of the distinction between observational and theoretical terms, i.e., their suggested definition also works in a purely theoretical language. The requirement of a finite number of non-logical axioms is also removed.

The tentative definition of meaningfulness that Carnap proposed in "The Methodological Character of Theoretical Concepts" was proved to be untenable. See, for example, David Kaplan, "Significance and Analyticity" in *Rudolf Carnap, Logical Empiricist* or Marco Mondadori's introduction to *Analiticità, Significanza, Induzione*, in which Mondadori suggests a possible correction of Carnap's definition.

With respect to inductive logic, I mention only Jaakko Hintikka's generalization of Carnap's

continuum of inductive methods. In Carnap's inductive logic, the probability of every universal law is always zero. Hintikka succeeded in formulating an inductive logic in which universal laws can obtain a positive degree of confirmation.

In *Meaning and Necessity*, 1947, Carnap was the first logician to use a semantic method to explain modalities. However, he used Tarskian model theory, so that every model of the language is an admissible model. In 1972 the American philosopher Saul Kripke was able to prove that a full semantics of modalities can be attainable by means of *possible-worlds semantics*. According to Kripke, not all possible models are admissible. You can read J. Hintikka's essay "Carnap's heritage in logical semantics" in *Rudolf Carnap, Logical Empiricist*, which explains that Carnap came extremely close to possible-worlds semantics but was not able to go beyond classical model theory.

I must stress that the *omega*-rule, which Carnap proposed in *The Logical Syntax of Language*, is now widespreadly used in metamathematical research - usually very involved - on many different subjects.

The Internet Encyclopedia of Philosophy

Carneades (213-129 BCE.)

A philosopher of Cyrene in Africa, founder of a sect called the Third or New Academy. The Athenians sent him with Diogenes the Stoic, and Critolaus the Peripatetic, as ambassador to Rome, BCE. 155. Of the three, Carneades excelled in vehement and rapid speaking ability; Critolaus excelled in correctness and elegance, and Diogenes in the simplicity and modesty. Carneades attracted the attention by the subtlety of his reasoning and the fluency of his language. Before Galba and Cato the Censor, he harangued with great variety of thought and copiousness of diction in praise of justice. The next day, to establish his doctrine of the uncertainty of human knowledge, he undertook to refute all his former arguments. Many were captivated by his eloquence. However, Cato, apprehensive lest the Roman youth should lose their military character in the pursuit of Grecian learning, persuaded the Senate to send back these philosophers, without delay, to their own schools. Carneades obtained such high reputation at home that other philosophers, when they had dismissed their scholars, frequently came to hear him. He died in BCE. 129.

Carneades is usually considered the greatest of the Academic skeptics. It was the doctrine of the New Academy that the senses, the understanding, and the imagination frequently deceive us, and therefore can not be infallible judges of truth; however, we infer appearances of truth or probabilities from the impression which we perceive to be produced on the mind by means of the senses. Carneades added nothing essentially new to their conclusions. However, his destructive criticisms acted like a battering-ram not only upon Stoicism, but upon all established philosophies. He maintained that these do not always correspond to the real nature of things, and that there is no infallible method of determining when they are true or false, and consequently that they afford no certain criterion of truth. As examples of his thoughts may be mentioned the two following. First, nothing can ever be proved. For the conclusion must be proved by premises, which in turn require proof, and so *ad infinitum*. Secondly, it is impossible to know whether our ideas of an object are true, that is, whether they resemble the object itself. To do so would involve getting outside our own minds. We know nothing of the object except our idea of it, and therefore we cannot compare the original and the copy, since we can see only the copy. Nevertheless, with respect to the conduct of life, Carneades held that probable appearances are a sufficient guide, because it is unreasonable that some degree of credit should not be allowed to those witnesses who commonly give a true report. He maintained that all the knowledge the human mind is capable of attaining is not science, but opinion.

IEP

Categorical Imperative

18th century German philosopher Immanuel Kant (1724-1804) presents a criterion of moral obligation, which he calls the categorical imperative. Kant's account of morality fits squarely into the deontological tradition and is found in three principal books: *The Foundations of the Metaphysics of Morals* (1785), *The Critique of Practical Reason* (1788), and *The Metaphysics of Morals* (1798). Kant's writings indicate that he was aware of the moral traditions that went before him, such as virtue theory which bases morality on good character traits, and consequentialist accounts which base morality solely on the consequences of actions. In all of his ethical writings, Kant rejects these traditional theories of morality and argues instead that moral actions are based on a "supreme principle of morality" which is objective, rational, and freely chosen: the categorical imperative. Kant's clearest account of the categorical imperative is in the *Foundations of the Metaphysics of Morals*.

In Section one of the *Foundations*, Kant argues against traditional criteria of morality, and explains why the categorical imperative can be the only possible standard of moral obligation. He begins with a general account of willful decisions. The function of the human will is to select one course of action from among several possible courses of action (for example, my choice to watch television right now instead of going jogging). Our specific willful decisions are influenced by several factors, such as laziness, immediate emotional gratification, or what is best in the long run. Kant argues that in moral matters the will is ideally influenced only by rational considerations, and not by subjective considerations such as one's emotions. This is because morality involves what is necessary for us to do (e.g., you must be benevolent), and only rational considerations can produce necessity. The rational consideration which influences the will must be a single principle of obligation, for only principles can be purely rational considerations. Also, the principle must be a command (or imperative) since morality involves a command for us to perform a particular action. Finally, the principle cannot be one that appeals to the consequences of an action, such as the joy I would receive from watching television; for, appeals to consequences involve emotional considerations. The only principle which fulfills these requirements is the categorical imperative which dictates the universalizability of our actions: "act only on that maxim by which you can at the same time will that it should become a universal law." Morality, then, consists of choosing only those actions that conform to the categorical imperative.

In Section two, Kant explains key terms, presents different formulations of the categorical imperative, and illustrates the categorical imperative with examples of specific immoral acts. He begins by distinguishing between types of imperatives. Imperatives in general are commands that dictate a particular course of action, such as "you shall clean your room." Hypothetical imperatives are commands that depend on my preference for a particular end, and are stated in conditional form, such as, "If I want to lose weight, then I should eat less." In this case, the command to eat less hinges on my previous preference to lose weight. There are two types of hypothetical imperatives. Problematic-hypothetical imperatives involve rules of skill based on preferences that vary from person to person (such as "If you want to be a doctor then you should go to medical school"). Assertoric-hypothetical imperatives, by

contrast, involve rules of prudence based on the preference everyone has to be happy (such as, "If you want to be happy, then you should go skydiving"). None of these hypothetical imperatives, however, are moral imperatives, since the command is based on subjective considerations that are not absolute. A categorical imperative, by contrast, is an absolute command, such as "you shall treat people with respect," which is not based on subjective considerations. Thus, the supreme principle of morality is a categorical imperative since it is not conditional upon one's preferences.

Kant continues by describing the sources of the above types of imperatives. His discussion uses four technical terms:

> Analytic propositions: propositions that are true by definition, such as "All wives are women."
>
> Synthetic propositions: propositions that are not true by definition, such as "Jones is bald."
>
> *A posteriori* knowledge: knowledge attained through the five senses, such as the fact that the door is brown.
>
> *A priori* knowledge: intuitive knowledge attained without use of the senses, such as 2+2=4.

Kant argues that problematic-hypothetical imperatives are analytic or true by definition, such as, "If you want to be a doctor, then you should go to medical school." Assertoric-hypothetical imperatives are less clear since the concept of happiness varies so greatly, as in the statement, "If you want to be happy, then you should go skydiving." However, Kant believes that even this statement is true by definition since if we fully understand happiness, we will also know the means to happiness. Finally, categorical imperatives are synthetic a priori, since the statement "you shall treat people with respect," is not true by definition, and is not known by means of the senses. Kant's point is that the categorical imperative involves a unique type of knowledge that is intuitive, yet informative.

In view of this background, Kant presents the single categorical imperative of morality: *act only on that maxim by which you can at the same time will that it should become a universal law*. Although there is only one categorical imperative, Kant argues that there can be four formulations of this principle:

> The Formula of the Law of Nature: "Act as if the maxim of your action were to become through your will a universal law of nature."
>
> The Formula of the End Itself: "Act in such a way that you always treat humanity, whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end."
>
> The Formula of Autonomy: "So act that your will can regard itself at the same time as making universal law through its maxims."
>
> The Formula of the Kingdom of Ends: "So act as if you were through your maxims a law-making member of a kingdom of ends."

According to Kant, each of these four formulations will produce the same conclusion regarding the morality of any particular action. Thus, each of these formulas offers a step by step procedure for determining the morality of any particular action

The formula of the law of nature tells us to take a particular action, construe it as a general maxim, then see if it can be willed consistently as a law of nature. If it can be willed consistently, then the action is moral. If not, then it is immoral. To illustrate the categorical imperative, Kant uses four examples that

cover the range of morally significant situations which arise. These examples include committing suicide, making false promises, failing to develop one’s abilities, and refusing to be charitable. In each case, the action is deemed immoral since a contradiction arises when trying to will the maxim as a law of nature. The formula of the end itself is more straight forward: a given action is morally correct if when performing that action we do not use people as a means to achieve some further benefit, but instead treat people as something which is intrinsically valuable. Again, Kant illustrates this principle with the above four examples, and in each case performing the action would involve treating a person as a means, and not an end.

Category

The term "category" comes from the Greek word *kategoria*, which is derived from *kata* ("against") and *agoreuein* ("to assert"). In Philosophy, the term means ultimate or fundamental divisions or kinds. Several schemes of categories have been offered in the history of philosophy. These schemes are sometimes descriptions of different kinds of things. At other times, they are different ways of thinking or talking about things in the world. To say that two things belong to completely different categories is to say that they have literally nothing in common, and we cannot apply the same descriptions to both unless we speak metaphorically.

Aristotle was the first to use the term category in philosophy. He adapted "categoria" from the legal language, which meant "accusation," and used it to mean that which is asserted about something. Aristotle distinguished between several types of categories including kind, quality, quantity or size, relation, location, time or date, action, and undergoing. For Kant, a category is any of the twelve forms or relating principles of the understanding, constituting necessary conditions of experience. Kant sought to derive an exhaustive list of pure forms of the understanding from the forms of judgment in the traditional logic: quantity, quality, relation, and modality. His list comprises three of each.

Hegel meant by categories the ideas which explain reality. He used a triad principle and generated around 272 categories. But Hegel also stated that categories were many and their exact number cannot be determined until the system of reality is completely explained. He thus marks a shift in the meaning of "category" as simply any basic notion, concept, or principle in a system of philosophy. Pierce held that categories are the most general terms into which experience can be divided. They reflect three types of predicates or relations, and his three main categories are "firstness," "secondness," and "thirdness." These terms stand for "monadic," "dyadic," and "polyadic" respectively.

Whitehead returned to a more traditional notion of "category" and elaborated a set of 37 categories under whose terms it should be possible to explain all experience. For Ryle categories are indefinitely numerous and unordered. The totality of categories is not in a principle an infinite hierarchy of types. According to him there are no mistakes that are strictly category-mistakes. Today the word "category" is used by most philosophers, if at all, to mean any supposedly ultimate type without making in convention as to what type it is.

The Chinese Room Argument

The Chinese room argument - John Searle's (1980a) thought experiment and associated (1984) derivation - is one of the best known and widely credited counters to claims of artificial intelligence (AI), i.e., to claims that computers *do* or at least *can* (someday might) think. According to Searle's original presentation, the argument is based on two truths: *brains cause minds*, and *syntax doesn't suffice for semantics*. Its target, Searle dubs "strong AI": "according to strong AI," according to Searle, "the computer is not merely a tool in the study of the mind, rather the appropriately programmed computer really *is* a mind in the sense that computers given the right programs can be literally said to *understand* and have other cognitive states" (1980a, p. 417). Searle contrasts "strong AI" to "weak AI". According to weak AI, according to Searle, computers just *simulate* thought, their seeming understanding isn't real (just as-if) understanding, their seeming calculation as-if calculation, etc.; nevertheless, computer simulation is useful for *studying* the mind (as for studying the weather and other things).

The Chinese Room Thought Experiment. Against "strong AI," Searle (1980a) asks you to imagine yourself a monolingual English speaker "locked in a room, and given a large batch of Chinese writing" plus "a second batch of Chinese script" and "a set of rules" in English "for correlating the second batch with the first batch." The rules "correlate one set of formal symbols with another set of formal symbols"; "formal" (or "syntactic") meaning you "can identify the symbols entirely by their shapes." A third batch of Chinese symbols and more instructions in English enable you "to correlate elements of this third batch with elements of the first two batches" and instruct you, thereby, "to give back certain sorts of Chinese symbols with certain sorts of shapes in response." *Those giving you the symbols* "call the first batch 'a script' [a data structure with natural language processing applications], "they call the second batch 'a story', and they call the third batch 'questions'; the symbols you give back "they call . . . 'answers to the questions'"; "the set of rules in English . . . they call 'the program'": *you yourself* know none of this. Nevertheless, you "get so good at following the instructions" that "from the point of view of someone outside the room" your responses are "absolutely indistinguishable from those of Chinese speakers." Just by looking at your answers, nobody can tell you "don't speak a word of Chinese." Producing answers "by manipulating uninterpreted formal symbols," it seems "[a]s far as the Chinese is concerned," you "simply behave like a computer"; specifically, like a computer running Schank and Abelson's (1977) "Script Applier Mechanism" story understanding program (SAM), which Searle's takes for his example. But in imagining *himself* to be the person in the room, Searle thinks it's "quite obvious . . . I do not understand a word of the Chinese stories. I have inputs and outputs that are indistinguishable from those of the native Chinese speaker, and I can have any formal program you like, but I still understand nothing." "For the same reasons," Searle concludes, "Schank's computer understands nothing of any stories" since "the computer has

nothing more than I have in the case where I understand nothing" (1980a, p. 418). Furthermore, since in the thought experiment "nothing . . . depends on the details of Schank's programs," the same "would apply to any [computer] simulation" of any "human mental phenomenon" (1980a, p. 417); that's all it would be, simulation. Contrary to "strong AI", then, no matter how intelligent-seeming a computer *behaves* and no matter what *programming* makes it behave that way, since the symbols it processes are meaningless (lack semantics) *to it*, it's not really intelligent. It's not actually thinking. Its internal states and processes, being purely *syntactic*, lack semantics (meaning); so, it doesn't really have *intentional* (i.e., meaningful) *mental states*.

Replies and Rejoinders. **Having laid out the example and drawn the aforesaid conclusion, Searle considers several replies offered when he "had the occasion to present this example to a number of workers in artificial intelligence" (1980a, p. 419). Searle offers rejoinders to these various replies.**

The Systems Reply **suggests that the Chinese room example encourages us to focus on the wrong agent: the thought experiment encourages us to mistake the would-be subject-possessed-of-mental-states for the person in the room. The systems reply grants that "the *individual who is locked in the room* does not understand the story" but maintains that "he is merely part of a whole system, and the *system* does understand the story" (1980a, p. 419: my emphases). Searle's main rejoinder to this is to "let the individual internalize all . . . of the system" by memorizing the rules and script and doing the lookups and other operations in their head. "All the same," Searle maintains, "he understands nothing of the Chinese, and . . . neither does the system, because there isn't anything in the system that isn't in him. If he doesn't understand then there is no way the system could understand because the system is just part of him" (1980a, p. 420). Searle also insists the systems reply would have the absurd consequence that "mind is everywhere." For instance, "there is a level of description at which my stomach does information processing" there being "nothing to prevent [describers] from treating the input and output of my digestive organs as information if they so desire." Besides, Searle contends, it's just ridiculous to say "that while [the] person doesn't understand Chinese, somehow the conjunction of that person and bits of paper might" (1980a, p. 420).**

The Robot Reply **- along lines favored by contemporary causal theories of reference - suggests what prevents the person in the Chinese room from attaching meanings to (and thus presents them from understanding) the Chinese ciphers is the sensory-motoric disconnection of the ciphers from the realities they are supposed to represent: to promote the "symbol" manipulation to genuine understanding, according to this causal-theoretic line of thought, the manipulation needs to be grounded in the outside world via the agent's causal relations to the things to which the ciphers, *as symbols*, apply. If we "put a computer inside a robot" so as to "operate the robot in such a way that the robot does something very much like perceiving, walking, moving about," however, then the "robot would," according to this line of thought, "unlike Schank's computer, have genuine understanding and other mental states" (1980a, p. 420). Against the Robot Reply Searle maintains "the same experiment applies" with only slight modification. Put the room, with Searle in it, inside the robot; imagine "some of the Chinese symbols come from a television camera attached to the robot" and that "other Chinese symbols that [Searle is] giving out serve to make the motors inside the robot move the robot's legs or arms." Still, Searle asserts, "I don't understand anything except the rules for symbol manipulation." He explains, "by instantiating the program I have no [mental]**

states of the relevant [meaningful, or intentional] type. All I do is follow formal instructions about manipulating formal symbols." Searle also charges that the robot reply "tacitly concedes that cognition is not solely a matter of formal symbol manipulation" after all, as "strong AI" supposes, since it "adds a set of causal relation[s] to the outside world" (1980a, p. 420).

The Brain Simulator Reply **asks us to imagine that the program implemented by the computer (or the person in the room) "doesn't represent information that we have about the world, such as the information in Schank's scripts, but simulates the actual sequence of neuron firings at the synapses of a Chinese speaker when he understands stories in Chinese and gives answers to them." Surely then "we would have to say that the machine understood the stories"; or else we would "also have to deny that native Chinese speakers understood the stories" since "[a]t the level of the synapses" there would be no difference between "the program of the computer and the program of the Chinese brain" (1980a, p. 420). Against this, Searle insists, "even getting this close to the operation of the brain is still not sufficient to produce understanding" as may be seen from the following variation on the Chinese room scenario. Instead of shuffling symbols, we "have the man operate an elaborate set of water pipes with valves connecting them." Given some Chinese symbols as input, the program now tells the man "which valves he has to turn off and on. Each water connection corresponds to synapse in the Chinese brain, and the whole system is rigged so that after . . . turning on all the right faucets, the Chinese answer pops out at the output end of the series of pipes." Yet, Searle thinks, obviously, "the man certainly doesn't understand Chinese, and neither do the water pipes." "The problem with the brain simulator," as Searle diagnoses it, is that it simulates "only the formal structure of the sequence of neuron firings": the insufficiency of this formal structure for producing meaning and mental states "is shown by the water pipe example" (1980a, p. 421).**

The Combination Reply **supposes all of the above: a computer lodged in a robot running a brain simulation program, considered as a unified system. Surely, now, "we would have to ascribe intentionality to the system" (1980a, p. 421). Searle responds, in effect, that since none of these replies, taken alone, has any tendency to overthrow his thought experimental result, neither do all of them taken together: zero times three is naught. Though it would be "rational and indeed irresistible," he concedes, "to accept the hypothesis that the robot had intentionality, as long as we knew nothing more about it" the acceptance would be simply based on the assumption that "if the robot looks and behaves sufficiently like us then we would suppose, until proven otherwise, that it must have mental states like ours that cause and are expressed by its behavior." However, "[i]f we knew independently how to account for its behavior without such assumptions," as with computers, "we would not attribute intentionality to it, especially if we knew it had a formal program" (1980a, p. 421).**

The Other Minds Reply **reminds us that how we "know other people understand Chinese or anything else" is "by their behavior." Consequently, "if the computer can pass the behavioral tests as well" as a person, then "if you are going to attribute cognition to other people you must in principle also attribute it to computers" (1980a, p. 421). Searle responds that this misses the point: it's "not. . .** ***how I know*** **that other people have cognitive states, but rather** ***what it is*** **that I am attributing when I attribute cognitive states to them. The thrust of the argument is that it couldn't be just computational processes and their output because the computational processes and their output can exist without the cognitive state" (1980a, p. 420-421: my emphases).**

The Many Mansions Reply **suggests that even if Searle is right in his suggestion that programming cannot suffice to cause computers to have intentionality and cognitive states, other means besides**

programming might be devised such that computers may be imbued with whatever does suffice for intentionality by these other means. This too, Searle says, misses the point: it "trivializes the project of Strong AI by redefining it as whatever artificially produces and explains cognition" abandoning "the original claim made on behalf of artificial intelligence" that "mental processes are computational processes over formally defined elements." If AI is not identified with that "precise, well defined thesis," Searle says, "my objections no longer apply because there is no longer a testable hypothesis for them to apply to" (1980a, p. 422).

Searle's "Derivation from Axioms." Besides the Chinese room thought experiment, Searle's more recent presentations of the Chinese room argument feature - with minor variations of wording and in the ordering of the premises - a formal "derivation from axioms" (1989, p. 701). The derivation, according to Searle's 1990 formulation proceeds from the following three axioms (1990, p. 27):

> **(A1) Programs are formal (syntactic).**
> **(A2) Minds have mental contents (semantics).**
> **(A3) Syntax by itself is neither constitutive of nor sufficient for semantics.**

to the conclusion:

> **(C1) Programs are neither constitutive of nor sufficient for minds.**

Searle then adds a fourth axiom (p. 29):

> **(A4) Brains cause minds.**

from which we are supposed to "immediately derive, trivially" the conclusion:

> **(C2) Any other system capable of causing minds would have to have causal powers (at least) equivalent to those of brains.**

whence we are supposed to derive the further conclusions:

> **(C3) Any artifact that produced mental phenomena, any artificial brain, would have to be able to duplicate the specific causal powers of brains, and it could not do that just by running a formal program.**
> **(C4) The way that human brains actually produce mental phenomena cannot be solely by virtue of running a computer program.**

On the usual understanding, the Chinese room experiment subserves this derivation by "shoring up axiom 3" (Churchland & Churchland 1990, p. 34).

Continuing Dispute. To call the Chinese room controversial would be an understatement. Beginning with objections published along with Searle's original (1980a) presentation, opinions have drastically divided, not only about whether the Chinese room argument is cogent; but, among those who think it is, as to why it is; and, among those who think it is not, as to why not. This discussion includes several noteworthy threads.

Initial Objections & Replies to the Chinese room argument besides filing new briefs on behalf of many of the forenamed replies(e.g., Fodor 1980 on behalf of "the Robot Reply") take, notably, two tacks. One tack, taken by Daniel Dennett (1980), among others, decries the dualistic tendencies discernible, for instance, in Searle's methodological maxim "always insist on the first-person point of view" (Searle 1980b, p. 451). Another tack notices that the symbols Searle-in-the-room processes are *not* meaningless ciphers, they're Chinese inscriptions. So they *are* meaningful; and so is Searle's processing of them in the room; whether he knows it or not. In reply to this second sort of objection, Searle insists that what's at issue here is *intrinsic intentionality* in contrast to the merely *derived intentionality* of inscriptions and other linguistic signs. Whatever meaning Searle-in-the-room's computation might derive from the meaning of the Chinese symbols which he processes will not be intrinsic to the process or the processor but "observer relative," existing only in the minds of beholders such as the native Chinese speakers outside the room. "Observer-relative ascriptions of intentionality are always dependent on the intrinsic intentionality of the observers" (Searle 1980b, pp. 451-452). The nub of the experiment, according to Searle's attempted clarification, then, is this: "instantiating a program could not be constitutive of intentionality, because it would be possible for an agent [e.g., Searle-in-the-room] to instantiate the program and still not have the *right kind* of intentionality" (Searle 1980b, pp. 450-451: my emphasis); the *intrinsic* kind. Though Searle unapologetically identifies *intrinsic* intentionality with *conscious* intentionality, still he resists Dennett's and others' imputations of dualism. Given that what it is we're attributing in attributing mental states is conscious intentionality, Searle maintains, insistence on the "first-person point of view" is warranted; because "the ontology of the mind is a first-person ontology": "the mind consists of qualia [subjective conscious experiences] . . . right down to the ground" (1992, p. 20). This thesis of Ontological Subjectivity, as Searle calls it in more recent work, is *not*, he insists, some dualistic invocation of discredited "Cartesian apparatus" (Searle 1992, p. xii), as his critics charge; it simply reaffirms commonsensical intuitions that behavioristic views and their functionalistic progeny have, for too long, highhandedly, dismissed. This commonsense identification of thought with consciousness, Searle maintains, is readily reconcilable with thoroughgoing physicalism when we conceive of consciousness as both caused by and realized in underlying brain processes. Identification of thought with consciousness along these lines, Searle insists, is not dualism; it might more aptly be styled monist interactionism (1980b, p. 455-456) or (as he now prefers) "biological naturalism" (1992, p. 1).

The Connectionist Reply (as it might be called) is set forth - along with a recapitulation of the Chinese room argument and a rejoinder by Searle - by Paul and Patricia Churchland in a 1990 *Scientific American* piece. The Churchlands criticize the crucial third "axiom" of Searle's "derivation" by attacking his would-be supporting thought experimental result. This putative result, they contend, gets much if not all of its plausibility from the lack of neurophysiological verisimilitude in the thought-experimental setup. Instead of imagining Searle working alone with his pad of paper and lookup table, like the Central Processing Unit of a serial architecture machine, the Churchlands invite us to imagine a more brainlike *connectionist* architecture. Imagine Searle-in-the-room, then, to be just one of very many agents, all working in parallel, each doing their own small bit of processing (like the many neurons of the brain). Since Searle-in-the-room, in this revised scenario, does only a very small portion of the total computational job of generating sensible Chinese replies in response to Chinese input, *naturally* he himself does not comprehend the whole process; so we should hardly expect *him* to grasp or to be conscious of the meanings of the communications he is involved, in such a minor way, in

processing. Searle counters that this Connectionist Reply - incorporating, as it does, elements of both systems and brain-simulator replies - can, like these predecessors, be decisively defeated by appropriately tweaking the thought-experimental scenario. Imagine, if you will, a Chinese gymnasium, with many monolingual English speakers working in parallel, producing output indistinguishable from that of native Chinese speakers: each follows their own (more limited) set of instructions in English. Still, Searle insists, obviously, none of these *individuals* understands; and neither does the whole company of them collectively. It's intuitively utterly obvious, Searle maintains, that no one and nothing in the revised "Chinese gym" experiment understands a word of Chinese either individually or collectively. Both individually and collectively, nothing is being done in the Chinese gym except meaningless syntactic manipulations from which intentionality and consequently meaningful thought could not conceivably arise.

Summary Analysis. **Searle's Chinese Room experiment parodies the Turing test, a test for artificial intelligence proposed by Alan Turing (1950) and echoing René Descartes' suggested means for distinguishing thinking souls from unthinking automata. Since "it is not conceivable," Descartes says, that a machine "should produce different arrangements of words so as to give an appropriately meaningful answer to whatever is said in its presence, as even the dullest of men can do" (1637, Part V), whatever *has* such ability evidently thinks. Turing embodies this conversation criterion in a would-be experimental test of machine intelligence; in effect, a "blind" interview. Not knowing which is which, a human interviewer addresses questions, on the one hand, to a computer, and, on the other, to a human being. If, after a decent interval, the questioner is unable to tell which interviewee is the computer on the basis of their answers, then, Turing concludes, we would be well warranted in concluding that the computer, like the person, actually thinks. Restricting himself to the epistemological claim that under the envisaged circumstances attribution of thought to the computer is *warranted,* Turing himself hazards no metaphysical guesses as to *what thought is* - proposing no definition or no conjecture as to the essential nature thereof. Nevertheless, his would-be experimental apparatus can be used to characterize the main competing metaphysical hypotheses here in terms their answers to the question of what else or what instead, if anything, is required to guarantee that intelligent-seeming behavior really is intelligent or evinces thought. Roughly speaking, we have four sorts of hypotheses here on offer. Behavioristic hypotheses deny that *anything* besides *acting* intelligent is required. Dualistic hypotheses hold that, besides (or instead of) intelligent-seeming behavior, thought requires having the right subjective conscious experiences. Identity theoretic hypotheses hold it to be essential that the intelligent-seeming performances proceed from the right underlying neurophysiological states. Functionalistic hypotheses hold that the intelligent-seeming behavior must be produced by the right procedures or computations.**

The Chinese experiment, then, can be seen to take aim at Behaviorism and Functionalism as a would-be counterexample to both. Searle-in-the-room behaves as if he understands Chinese; yet doesn't understand: so, contrary to Behaviorism, acting (as-if) intelligent does not suffice for being so; something else is required. But, contrary to Functionalism this something else is not - or at least, not just - a matter of by what underlying procedures (or programming) the intelligent-seeming behavior is brought about: Searle-in-the-room, according to the thought-experiment, may be implementing whatever program you please, yet still be lacking the mental state (e.g., understanding Chinese) that his behavior would seem to evidence. Thus, Searle

claims, Behaviorism and Functionalism are utterly refuted by this experiment; leaving dualistic and identity theoretic hypotheses in control of the field. Searle's own hypothesis of Biological Naturalism may be characterized sympathetically as an attempt to wed - or unsympathetically as an attempt to waffle between - the remaining dualistic and identity-theoretic alternatives.

Postscript. **Debate over the Chinese room thought experiment - while generating considerable heat - has proven inconclusive. To the Chinese room's champions - as to Searle himself - the experiment and allied argument have often seemed so obviously cogent and decisively victorious that doubts professed by naysayers have seemed discreditable and disingenuous attempts to salvage "strong AI" at all costs. To the argument's detractors, on the other hand, the Chinese room has seemed more like "religious diatribe against AI, masquerading as a serious scientific argument" (Hofstadter 1980, p. 433) than a serious objection. Though I am with the masquerade party, a full dress criticism is, perhaps, out of place here (see Hauser 1993 and Hauser forthcoming). I offer, instead, the following (hopefully, not too tendentious) observations about the Chinese room and its neighborhood.**

(1) Though Searle himself has consistently (since 1984) fronted the formal "derivation from axioms," general discussion continues to focus mainly on Searle's striking thought experiment. This is unfortunate, I think. Since intuitions about the experiment seem irremediably at loggerheads, perhaps closer attention to the *derivation* could shed some light on vagaries of the argument (see Hauser forthcoming).

(2) The Chinese room experiment, as Searle himself notices, is akin to "arbitrary realization" scenarios of the sort suggested first, perhaps, by Joseph Weizenbaum (1976, Ch. 2), who "shows in detail how to construct a computer using a roll of toilet paper and a pile of small stones" (Searle 1980a, p. 423). Such scenarios are also marshaled against Functionalism (and Behaviorism *en passant*) by others, perhaps most famously, by Ned Block (1978). Arbitrary realizations imagine would-be AI-programs to be implemented in outlandish ways: *collective implementations* (e.g., by the population of China coordinating their efforts via two-way radio communications), imagine programs implemented by groups; *Rube Goldberg implementations* (e.g., Searle's water pipes or Weizenbaum's toilet paper roll and stones), imagine programs implemented bizarrely, in "the wrong stuff." Such scenarios aim to provoke intuitions that no such thing - no such collective or no such ridiculous contraption - could possibly be possessed of mental states. This, together with the premise - generally conceded by Functionalists - that programs might *well be* so *implemented*, yields the conclusion that computation, the "right programming" does not suffice for thought; the programming must be implemented in "the right stuff." Searle concludes similarly that what the Chinese room experiment shows is that "[w]hat matters about brain operations is not the formal shadow cast by the sequences of synapses but rather the actual properties of the synapses" (1980, p. 422), their "specific biochemistry" (1980, p. 424).

(3) Among those sympathetic to the Chinese room, it is mainly its negative claims - not Searle's positive doctrine - that garner assent. The positive doctrine - "biological naturalism," is either confused (waffling between identity theory and dualism) or else it *just is* identity theory or dualism.

(4) Since Searle argues against identity theory, on independent grounds, elsewhere (e.g., 1992, Ch. 5); and since he acknowledges the possibility that some "specific biochemistry" different than ours might suffice to produce conscious experiences and consequently intentionality (in Martians, say),

and speaks unabashedly of "ontological subjectivity" (see, e.g., Searle 1992, p. 100); it seems most natural to construe Searle's positive doctrine as basically dualistic, specifically as a species of "property dualism" such as Thomas Nagel (1974, 1986) and Frank Jackson (1982) espouse. Nevertheless, Searle frequently and vigorously protests that he is not *any* sort of dualist. Perhaps he protests *too much*.

(5) If Searle's positive views *are* basically dualistic - as many believe - then the usual objections to dualism apply, other-minds troubles among them; so, the "other-minds" reply can hardly be said to "miss the point". Indeed, since the question of whether computers (can) think *just is* an other-minds question, if other minds questions "miss the point" it's hard to see how the Chinese room speaks to the issue of whether computers really (can) think at all.

(6) Confusion on the preceding point is fueled by Searle's seemingly equivocal use of the phrase "strong AI" to mean, on the one hand, *computers really do think*, and on the other hand, *thought is essentially just computation*. Even if thought is not essentially just computation, computers (even present-day ones), nevertheless, might really think. That their behavior seems to *evince* thought is why there is a problem about AI in the first place; and if Searle's argument merely discountenances theoretic or metaphysical identification of thought with computation, the behavioral evidence - and consequently Turing's point - remains unscathed. Since computers seem, on the face of things, to think, the conclusion that the essential nonidentity of thought with computation would seem to warrant is that whatever else thought essentially is, computers *have this too*; not, as Searle maintains, that computers' seeming thought-like performances are *bogus*. Alternately put, equivocation on "Strong AI" invalidates the would-be dilemma that Searle's intitial contrast of "Strong AI" to "Weak AI" seems to pose:

> Strong AI (they really do think) or Weak AI (it's just simulation).
> Not Strong AI (by the Chinese room argument).
> *Therefore,* Weak AI.

To show that *thought is not just computation* (what the Chinese room -- if it shows anything -- shows) is not to show that *computers' intelligent seeming performances are not real thought* (as the "strong" "weak" dichotomy suggests) .

Chrysippus (c. 280-207)

Chrysippus was a Stoic philosopher of Soli in Cilicia Campestris. He moved to Athens, and became a disciple of Cleanthes, the successor of Zeno. He was equally distinguished for his natural abilities and industry and rarely went a day without writing 500 lines. He wrote several hundred volumes, of which three hundred were on logical subjects, borrowing largely from others. With the Stoics in general, he maintained that the world was God, or a universal effusion of his spirit, and that the superior part of this spirit, which consisted in mind and reason, was the common nature of things, containing the whole and every part of it. Sometimes he speaks of God as the power of fate and the necessary chain of events. Sometimes he calls him fire. Other times he deifies the fluid parts of nature, such as water and air, or he deifies the earth, sun, moon, a d stars and the universe as a whole. To too he deifies those who have obtained immortality. He was fond of the syllogistic figure *sorities* in arguing, which is hence called by Persius "the heap of Chrysippus." His discourses contain more curiosities and distinctions than solid arguments.

In disputation, in which he spent the greatest part of his life, he displayed a degree of confidence which bordered on audacity. He often said to his preceptor, "Give me doctrines, and I will find arguments to support them." Once he was asked to advise an instructor for a someone's son. His response was "Me; for if I thought any philosopher excelled me, I would myself become his pupil." He showed contempt for distinctions of rank and, unlike other philosophers, would never honor princes or other important people by dedicating his works to them. Through his vehemence he made many adversaries, particularly among the Academic and Epicurean philosophers. Even his friends in the Stoic school complained that, in the heat of dispute, while the absurdity or obscurity of his opponent's views, he would become so illogical as to give his opponents an advantage over him. It was also a common practice with Chrysippus to take the opposite sides of the same question, and thus furnish his opponent with weapons which might easily be turned against himself as occasion offered. Carneades, who was one of his most able and skillful opponents, frequently used this circumstance and refuted Chrysippus by convicting him of inconsistency. Of his writings (reported to have been 700 in all), nothing remains except a few fragments which are preserved in the works of Cicero, Plutarch, Seneca, and Aulus Gellius.

Marcus Tullius Cicero (106-43 BCE.)

LIFE. Cicero is credited with being the greatest of the Roman orators. He was born at Arpinum, the native place of Marius, 106 BCE., the same year which gave birth to Pompey the Great. His family was ancient, and of equestrian rank, but had never taken part in public affairs at Rome, though both his father and grandfather were persons of consideration in the part of Italy in which they resided. His father determined to educate his two sons, Marcus and Quintus, on an enlarged and liberal plan, and to fit them for the prospect of public employment, which his own weak state of health incapacitated him from seeking. One of his earliest masters was the poet Archias, whom he defended afterwards. Soon after he assumed the toga virilis, he was placed tinder the care of Scaevola, the celebrated lawyer, whom he introduces in several of his philosophical dialogues. Cicero took the opportunity of serving a campaign under the consul Pompeitis Strabo, father of Pompey the Great. He returned to the study of philosophy tinder Philo the Academic. But his chief attention was reserved for oratory, to which he applied himself with the assistance of Molo, the ablest rhetorician of the day. Diodotus the Stoic also exercised him in the argumentative subtleties for which the disciples of Zeno were known.

Cicero was the first Roman who found his way to the highest dignities of the State with no other recommendation than his powers of eloquence and his merits as a civil magistrate. The first case of importance which he undertook was the defense of Roscius Amerintis, in which he distinguished himself by his courageous defense, of his client, who had been accused of parricide, by Chrysogonus, a favorite of Stilia's. This obliging him, however, according to Plutarch, to leave Rome from Prudential motives, the power of Sulla being at that time paramount, he traveled for two years under pretense of his health. At Athens he met with Pomponius Atticus, whom he had formerly known at school, and attended the lectures of Antiochus, who, under the name of an Academic, taught the dogmatic doctrines of Plato and the Stoics. Though Cicero at first evinced considerable dislike, for his philosophical views, be seems afterwards to have adopted the sentiments of the Old Academy, which they much resembled, and not until late in life to have. relapsed into the skeptical tenets of his earlier instructor Philo.

After visiting the principal philosophers and rhetoricians of Asia, he returned at the age of thirty to Rome, so strengthened that he soon eclipsed in speaking all his competitors for public favor. Five years after his quaestorship Cicero was elected aedile. After the customary interval of two years, he was returned at the head of the list as praetor, and now made his first appearance on the Rostra in support of the Manilian law. At the expiration of his praetorship, he refused to accept a foreign province, the usual reward of that position. Instead, he sought the consulship. His consulate was succeeded by the return of Pompey from the East, and the establishment of the First Triumvirate. This disappointed his hopes of political greatness, and he resumed forensic and literary occupations. After four years, he was involved in a scandal that resulted in his voluntary exile. He later returned from exile, and five years later held command of the government of Cilicia. He resigned his command, and returned to Italy. With the assassination of Caesar, he hoped to

regain political influence, but Antony took Caesar's place, and Cicero favored Octavianus instead. This association proved disadvantageous, and, after several attempts at escape, he was captured and assassinated. His head and hands were cut off, and carried to Rome and displayed at the Rostra.

PHILOSOPHICAL WRITINGS. The treatise *De Legibus* has reached us in an imperfect state, only three books remaining, and these disfigured by numerous chasms that cannot be supplied. It traces the philosophic principles of jurisprudence to their remotest sources, sets forth a body of laws conformable to Cicero's idea of a well-regulated State, and is supposed to have treated in the books that are lost of the executive power of magistrates and the rights of roman citizens. The treatise *De Finibus Bonorum et Malorum* is written after the manner of Aristotle, and discusses the chief good and the chief evil (*summum bonum et summum malum*); in it Cicero explains the several opinions entertained on this subject by the philosophers of antiquity. The *Academicae Quaestiones* relates to the Academic philosophy, whose tenets Cicero himself had embraced. It is in account and defense of the doctrines of the Academy. In the *Tusculanae Disputationes,* five books are devoted to as many different questions of philosophy, bearing the most strongly on the practice of life, and involving topics the most essential to human happiness. The Paradoxa contains a defense of six paradoxes of the stoics. The work *De Natura Deorum,* in three books, examines the various theories of the Greeks and Romans on the nature of the gods, to which the treatise *De Divinatione* may be seen as a supplement. The essay De Officiis, on moral duties, has sometimes been called the Roman *Whole Duty of Man*; the dialogues *De Senectute* and *De Amicitia* have been regarded as among the most highly finished performances of which any language can boast. We have to lament the loss of the treatises *De Consolatione, De Gloria,* and the one entitled *Hortensius,* in which last Cicero undertook the defense of learning and philosophy, and left to his illustrious competitor the task of arraigning them. It was this book which first led St. Augustine to the study of Christian philosophy and the doctrines of Christianity. The treatise *De Republica* has been in part rescued from the destroying hand of time by the labors of Mai. Except the works *De Inventions* and *De Oratore*, this was the earliest of Cicero's literary productions. It written in 53 BCE, just before its author set out for his proconsular government in Cilicia. He was then 53. The object and spirit of the work were highly patriotic. He wished to bring the constitution back to its first principles by an impression expositive of its theory; to inflame his contemporaries with the love of virtue by portraying the character of their ancestors in its primeval purity; and while he was raising, a monument to all future ages of what Rome had been, to inculcate upon his own times what it ought till to be. We know it to have been his original purpose to make it a voluminous Work, for he expressly tells his brother that it was to be extended to nine books.

PHILOSOPHICAL VIEWS. Cicero, as a philosophers belongs to the New Academy. It has been disputed whether be was really attached to this system, or had merely resorted to it as being the best adapted for furnishing, him with oratorical arguments suited to all occasions. At first its adoption was subsidiary to his other plans. But, towards the conclusion of his life, when lie no longer maintained the place he was ,wont to hold in the Senate or the Forum, and when philosophy formed the occupation "with which," to quote his own words, "life was just tolerable, and without which it would have been intolerable," he doubtless became convinced that the principles of the Now Academy, illustrated as they had been by Carneades and Philo, formed the soundest system which had descended to mankind from the schools of Athens. The attachment, however, of Cicero to the Academic philosophy was free from the exclusive spirit of sectarianism, and hence it did not prevent his extracting from other systems what lie found in them conformable to virtue and

reason. His ethical principles, in particular, appear eclectic, having been in a great measure formed from the opinions of the Stoics. Of most of the Greek sects he speaks with respect and esteem. For the Epicureans alone he seems, not withstanding his friendship for Atticus, to have entertained a decided aversion and contempt. The general purpose of Cicero' philosophical works was rather to give a history of the ancient philosophy, than dogmatically to inculcate opinions of his own. It was his great aim to explain to his follow-citizens, in their own language, whatever the sages of Greece had taught on the most important subjects, in order to enlarge their minds and reform their morals. His peculiar merit as a philosophical writer lay in his luminous and popular exposition of the leading principles and disputes of the ancient schools, and no works transmitted from antiquity present so concise and comprehensive a view of the opinions of the Greek philosophers. The most obvious peculiarity of Cicero's philosophical writings is their form of dialogue.

Cleanthes (331-232 BCE.)

Cleanthes was a Stoic philosopher of Assus in Lydia, and a disciple of Zeno of Citium. After the death of Zeno he presided over his school. He was originally a wrestler, and in this capacity he visited Athens, where he became acquainted with philosophy. Although he possessed no more than four *drachma*, he was determined to put himself under the an eminent philosopher. His first master was Crates, the Academic. He afterward became Zeno's disciple and an advocate of his doctrines. By night he drew water as a common laborer in the public gardens so that he would have leisure to attend lectures in the daytime. The Athenian citizens observed that, although he appeared strong and healthy, he had no visible means of subsistence; they then summoned him before the Areopagas, according to the custom of the city, to give an account of his manner of living. He then produced the gardener for whom he drew water, and a woman for whom he ground meal, as witnesses to prove that he lived by the labor of his hands. The judges of the court were struck with such admiration of his conduct, that they ordered ten *minae* to be paid him out of the public treasury. Zeno, however, did not allow him to accept it. Antigonus afterward presented him with three thousand *minae*. From the manner in which this philosopher supported himself, he was called "the well drawer." For many years he was so poor that he was compelled to take notes on Zeno's lectures on shells and bones, since he could not afford to buy better materials. He remained, however, a pupil of Zeno for nineteen years.

His natural faculties were slow. But resolution and perseverance enabled him to overcome all difficulties. At last he became so complete a master of Stoicism that he was perfectly qualified to succeed Zeno. His fellow disciples often ridiculed him for his dullness by calling him an ass. However, his answer was, that if he were an ass he was the better able to bear the weight of Zeno's doctrine. He wrote much, but none of his writings remain except a hymn to Jupiter. After his death, the Roman senate erected a statue in honor of him at Assus. It is said that he starved himself to death in his 99th year.

Cognitive Relativism

Cognitive relativism asserts the relativity of truth. On the other hand, moral relativism asserts the relativity of morality. Because of the close connections between the concept of truth and concepts such as rationality and knowledge, cognitive relativism is often taken to encompass, or imply, the relativity of both rationality and knowledge. The framework, or standpoint, to which truth is relativized is usually understood to be a conceptual scheme. This may be the conceptual scheme of an entire culture or period; or it may be conceived more narrowly as the theoretical framework of a particular community: for example, quantum physicists, or Southern Baptists. Like other forms of relativism, cognitive relativism denies that any of these standpoints enjoy a uniquely privileged status. None of them offer a 'God's eye point of view', or represent the standpoint dictated to us by objective standards of rationality.

Cognitive relativism, like many other forms of relativism, is often said to have been first put forward by the ancient sophists, particularly Protagoras, who began his work 'Truth' with the famous statement: ''Man is the measure of all things--of things that are, that they are, of things that are not that they are not.' But with the possible exception of the sophists, few philosophers in the Western tradition have espoused any form of cognitive relativism until relatively recent times. Most assumed that there is some standpoint--for example, that of God--in relation to which our judgements are definitively true or false.

In the nineteenth century this assumption came to be seriously questioned by a small number of important thinkers, most notably Nietzsche and William James. In the twentieth century a relativistic view of truth, although it still provokes vituperative responses from anti-relativists, has undeniably gained many more adherents; indeed, it has become almost commonplace in some philosophical circles. The reasons for this development are diverse. They include:

> i) the example offered by relativistic views of moral standards, views which gained in popularity as knowledge of other cultures was extended;
>
> ii) growing awareness, also due to research in anthropology and linguistics, that people in different cultures view the world through radically different conceptual frameworks;
>
> iii) the working out of the full implications of Kant's 'Copernican Revolution' in metaphysics, according to which the objects of our knowledge are shaped by the categories through which we cognize them;
>
> iv) in continental philosophy, the implications--intended or otherwise--of Hegel's historicism, Marx's theory of ideology, and Nietzsche's perspectivism;
>
> v) in English-speaking philosophy, the critique of the positivist philosophy of science, the problems posed by the ideal of objectivity or neutrality in the social sciences, and the impact of discoveries in psychology concerning the interpretation of data.

Relativistic views of truth have received further impetus from or found expression in the works of many widely read twentieth century thinkers such as the later Wittgenstein, Quine, Kuhn, Winch, Goodman, Rorty, Gadamer, Foucault, and Derrida.

Cognitive relativists do not simply assert the different cultures or communities have different views about which beliefs are true; no-one disputes that. Nor do they merely claim that different communities operate with different epistemic norms--i.e. criteria of truth and standards of rationality. That, too, seems to be obvious. The controversial claim at the heart of cognitive relativism is that no one set of epistemic norms is metaphysically privileged over any other. This is the claim which non-relativists reject, arguing, on the contrary, that some epistemic norms--for example, those employed by modern science--enjoy a special status in virtue of which they can serve as objective, universally valid, criteria of truth and rationality. Relativists respond to this argument by challenging their opponents to prove the superiority of the epistemic norms they favour. In reply, anti-relativists commonly argue that the success of certain norms in practice--for example, the success of modern science in enabling us to manipulate the world--constitutes a proof that these norms are not just social conventions but really do help us decide which of our judgements are objectively true.

The standard objection to cognitive relativism is that it is self-refuting. If I assert that all judgements are only true relative to some non-privileged standpoint, the objection runs, I am implicitly claiming that this judgement--i.e. the thesis of relativism--is true in some non-relativistic sense. The usual rejoinder by relativists to this objection is a denial that they have to commit themselves to any non-relativistic notion of truth. It is possible, they say, to advance a claim and hold it to be true relative to a given set of norms, without committing oneself to the view that it is true, or that the norms in question are valid, in some further, non-relativistic sense.

A related objection is that the relativist, by his or her own lights, must concede that from some points of view relativism will appear false. Moreover, since no standpoint is uniquely privileged, these standpoints, and the views they encompass or imply, are equally worthy of our respect. The relativist must therefore hold that relativism is both true and false. To this the relativists can reply that while relativism may indeed be false from certain perspectives, these are not perspectives that consistent relativists will be committed to. In fact, they will argue, of those who accept the major paradigm shifts that have characterized philosophy over the last two centuries, relativists can claim to be the most consistent, since they alone accept the full implications of these shifts for our notions of truth and rationality.

Emrys Westacott
Alfred University

Consequentialism

"Consequentialism" refers to a class of normative moral theories which maintain that an action is morally right if the consequences of that action are more favorable than unfavorable. Thus, correct moral conduct is determined solely by a cost-benefit analysis of an action's consequences. Consequentialism requires that we first tally both the good and bad consequences of an action; we then determine whether the total good consequences outweigh the total bad consequences. If the good consequences are greater, then the action is morally proper. If the bad consequences are greater, then the action is morally improper. Consequentialist theories are also called teleological theories, from the Greek word telos, or end, since the end result of the action is the sole determining factor of its morality.

Most versions of consequentialism are more precisely formulated than the general principle above. In particular, contending consequentialist theories specify which consequences for affected groups of people are relevant. Three subdivisions of consequentialism emerge:

- **Ethical Egoism: an action is morally right if the consequences of that action are more favorable than unfavorable only to the agent performing the action.**
- **Ethical Altruism: an action is morally right if the consequences of that action are more favorable than unfavorable to everyone except the agent.**
- **Utilitarianism: an action is morally right if the consequences of that action are more favorable than unfavorable to everyone.**

Advocates of all three views often defended their theories by appealing to certain human instincts. Proponents of ethical egoism appeal a psychological principle of motivation called psychological egoism. Psychological egoism states that all human actions, with no exception, are ultimately motivated by selfish interests. This, they argue, is an unalterable fact of human nature. Egoists argue further that moral obligation must operate within the confines of our human makeup (we clearly cannot be expected to perform actions beyond our abilities). The conclusion they draw, then, is that ethical egoism is the only possible criterion for ethical judgment since it alone recognizes our completely selfish motivations. But, ethical altruism makes a similar appeal to human nature. Altruists reject the theory of psychological egoism and argue instead that humans are instinctively benevolent. And instinctive benevolence, they argue, is the feature of our human nature which is the basis of our altruistic moral obligations. Finally, utilitarianism suggests a mediation between our selfish and altruistic ideals. Some utilitarians argue that our public and private lives are so entwined, that when we pursue our selfish interests, we are at the same time pursing the interests of others. J.S. Mill also argued that, although humans are selfish, we also have an instinctive feeling of unity which helps expand our private interests.

Unfortunately, all of these appeals to instinctive motives fail, for there is no way to empirically establish whether human nature is instinctively selfish, benevolent, or some mixture of the two. All three consequentialist theories can be evaluated from the standpoint of our common moral

intuitions. Problems are immediately revealed with ethical egoism. According to ethical egoism, acts of lying, stealing, and even killing would be morally permissible so long as (1) the agent benefited, and (2) he was not caught. But, it is clearly contrary to our common notions of morality to call such acts "moral." Ethical altruism also clashes with our common moral intuitions since most believe that one's own interests should count for at least something. Finally, problems arise with utilitarianism because of its emphasis on public benefit. According to utilitarianism, it would be morally wrong to waste time on leisure activities such as watching television, since our time could be spent in ways which produced a greater social benefit, such as charity work.

Finally, all of the above versions of consequentialism leave open the possibility that a heinous action, such as torture or slavery, could be morally permissible if its benefits outweighed its disbenefits. However, our common moral intuitions tell us that such actions are unjust regardless of the beneficial consequences produced. Consequentialism, then, appears to be flawed at its very root since justice can be dispensed with if it produces the appropriate benefits. In view of the above problems, consequentialist principles have been modified to bring these theories more in line with our common moral intuitions. This is especially so with utilitarianism.

The Internet Encyclopedia of Philosophy

Ralph Cudworth (1617-1688)

Member of seventeenth century school of philosophers known as the "Cambridge Platonists"; b. at Aller, in Somersetshire (12 m. s.w. of. Wells), 1617; d. at Cambridge June 26, 1688. He entered Emmanuel College, Cambridge, in 1632, and, after taking his M.A. degree in 1639, became fellow and tutor of the college. In 1642 he entered the lists against the Catholic party with his first published work, *A Discourse concerning the True Nature of the Lord's Supper*, which he considers to be that of a "feast upon a sacrifice," analogous to the feasts which followed the legal sacrifices among the Jews; not itself sacrificium, but, in Tertullian's language, participatio sacrificii. Soon after he published The Union of Christ and the Church; in a Shadow, in which he attempted to vindicate what he thought Protestants had too much lost sight of, the higher meaning of marriage. Young as he was, he had already mastered all the main sources of philosophy, medieval as well as classical, and quotes freely from the Neoplatonists and Cabalists, as well as from such modern Platonists as Vives and Pico della Mirandola . In 1644 he was appointed master of Clare Hall by the Parliamentary visitors, and a year later was made regius professor of Hebrew, a position which his knowledge of Jewish literature and antiquities made congenial to him. It seems that he thought of leaving Cambridge in 1651, but the election to the mastership of Christ's College in 1654 settled him there anew. In spite of his close relations with the Commonwealth government, he was undisturbed at the Restoration, and was even presented in 1662 to the rectory of Ashwell in Herefordshire by Sheldon, archbishop of Canterbury, and made a prebendary of Gloucester in 1678. Academic and philosophic labors occupied the remainder of his life. Alarmed by the tendencies of the irreligious and deistic writers of the time, especially Hobbes, he essayed to meet them by a counter-philosophy which should go to the depth of human thought and belief. The most important part of what in his conception was intended to constitute one great whole was *The True Intellectual System of the Universe*, finished in 1671 but not published until 1678. Its full importance was not recognized until after its author's death; Le Clerc published extracts from it in 1703, and attracted to it the attention of Continental thinkers; in 1706 an abridged edition was published in London by Wise; and in 1733 a Latin version appeared with notes of his own, reproduced in the London edition of 1845. In this great treatise Cudworth combated the atheistic hypothesis.

He planned to set forth, against various forms of fatalism which appeared to him inconsistent with the true order of the universe, three great principles which should sum up religious and moral truth. These were (1) the reality of a supreme divine intelligence and a spiritual world, against the atomistic materialism of Democritus and Epicurus; (2) the eternal reality of moral ideas against the medieval Nominalists and their successors; and (3) the reality of moral freedom and responsibility in man against all pantheistic naturalism and stoicism. Of these the Intellectual System deals formally with the first only. To the later parts belong the *Treatise on Eternal and Immutable Morality*, posthumously published by Bishop Chandler in 1731, and the *Treatise on Free Will*, ed. Allen, 1838, as well as some two thousand folio pages of manuscript still lying in the

British Museum. As a philosopher he was not a pure Platonist; in metaphysics, indeed, he followed Plato and the Neoplatonists, but in natural philosophy the Atomists, and in that of religion Lord Herbert of Cherbury. His theological standpoint was determined partly by his philosophy, partly by the circumstances of his time. He asserted the necessity of revealed religion, but saw in philosophy a divine illumination. Averse from partisan strife, he held a middle course between the rigid High-churchmanship of the school of Laud and Independent fanaticism, combining the recognition, with the former, of the rightfulness of an ecclesiastical constitution and an order of worship, and with the latter of the necessity of inner light and an unswerving devotion to ethical ideals.

Richard Cumberland (1631-1718)

Laws of Nature. Cumberland's best known work is *De Legibus Naturae* (1672), the title-page of profess to "consider and refute... the elements of Mr. Hobbes's Philosophy, as well Moral as Civil." It puts forward a doctrine of morality which is based on the law of nature, and this is accompanied by a running criticism of Hobbes's views. Cumberland looks upon the law of nature as capable of being inferred from observation of physical and mental phenomena (themselves due to the will of God), and at the same time as pointing out the "action of a rational agent which will chiefly promote the common good."

He attacks the neo-Platonists, and the theory of innate ideas as a Platonic error:

> **The *Platonists,* indeed, clear up this Difficulty in an easier manner, by the Supposition of *innate ideas,* as well of the Laws of Nature themselves, as of those Matters about which they are conservant; but, truly, I have not been so happy as to learn the Laws of Nature in so short a way. Nor seems it to me well advised, to build the Doctrine of *natural Religion* and *Morality* upon an *Hypothesis,* which has been by the *generality of Philosophers* as well *Heathen* as *Christian,* and *can never be proved* against the *Epicureans,* with whom is our chief controversy. [Introduction, Sect. 5]**

Laws of Nature, in this ethical reference, are defined by him as "propositions of unchangeable Truth, which direct our voluntary Actions about choosing Good and Evil; and impose an Obligation to external actions even without civil Laws, and laying aside all Considerations of those compacts which constitute civil government" (Ch. 1, p. 39).

He defines 'Good' as "that which preserves, or enlarges and perfects, the Faculties of any one thing, or of several" (Ch. 2, p. 165). It follows that the Law of Nature prescribes those actions which "will chiefly promote the common Good, and by which only the entire Happiness of particular Persons can be obtained" (Ch. 5, p. 189). He also includes both happiness and perfection, or development of faculty, as inseparable elements in the Good. He is particularly concerned with the determination of the form of conduct which will lead to the attainment of this end; and his conclusion is that the best method of securing it is that of benevolence, or regard for the common good, as opposed to selfish preoccupation with our own individual interests. "The greatest Benevolence of every rational Agent towards all, forms the happiness state of every, and of all the Benevolent, as far as is in their Power; and is necessarily requisite to the happiest State which they can attain, and therefore the common Good is the supreme Law" (Ch. 1). This endeavor to promote the common good "includes our Love of God, and of all Mankind, who are the Parts of this System. God, indeed, is the principal Part; Men the subordinate: A benevolence toward both includes Piety and Humanity, that is, both Tables of the Law of Nature" (Introduction, Sect. 15, p. 20).

He repeatedly points out that the common good includes our own, as one of its parts; but it must be sought only as a part, in subordination to the whole. Cumberland's confidence in the perfect coincidence of virtue, or benevolence, and individual happiness ultimately depends upon his

doctrine of the divine sanctions of the Laws of Nature. But his main interest in the ethical question is to insist, against Hobbes, upon the "naturalness" of the law of benevolence and the inherent unreasonableness of separating the individual and his good from the system of rational beings of which he is in reality only a part, and with whose good his own is inseparably bound up. Thus, he thinks that the "rules of life" are as plain as the "art of numbering," and the following propositions are laid down as necessarily true: (1) "that the good of all rational beings is greater than the like good of any part of that aggregate body, that is, that it is truly the greatest good"; (2) "that in promoting the good of this whole aggregate, the good of individuals is contained and promoted"; and (3) "that the good of every particular part requires the introducing and settling of distinct property in such things, and such services of rational agents, as contribute to the common happiness."

Damon (5th Cn. BCE.)

Damon was a 5th century BCE. Pythagorean philosopher of Syracuse. Damon was a close friend to Phintias the Pythagorean. Dionysius, the tyrant, having condemned Phintias to death for conspiring against him, Phintias begged that leave might be allowed him to go for a short period to a neighboring place, in order to arrange some family affairs, and offered to leave one of his friends in the hands of Dionysius as a pledge for his return by an appointed time, and who would be willing, in case Phintias broke his word, to die in his stead. Dionysius, skeptical as to the existence of such friendship, and prompted by curiosity, assented to the arrangement, and Damon took the place of Phintias. The day appointed for the return of Phintias arrived, and the public expectation was highly excited as to the probable issue of this singular affair. The day drew to a close; no Phintias came; and Damon was in the act of being led to execution, when, of a sudden, the absent friend, who had been detained by unforeseen and unavoidable obstacles, presented himself to the eyes of the admiring crowd and saved the life of Damon. Dionysius was so much struck by this instance of true attachment that he pardoned Phintias, and entreated the two to allow him to share their friendship (Val. Max. iv. 7; Plut. *De Amic Mult.*).

Donald Davidson (b. 1917)

LIFE AND INFLUENCES. **Donald Davidson, one of the most significant philosophers of the XX century, was born 6 March, 1917 in Springfield, Massachusetts. He studied English, Comparative Literature and Classics in his undergraduate years at Harvard. In his sophomore year at Harvard, Davidson attended two classes that made a lasting impression on him. These two classes on philosophy were taught by Alfred North Whitehead in the last year of his career. Davidson was then accepted to graduate studies in philosophy at Harvard, where his teacher was Willard Van Orman Quine. Quine set Davidson on a course in philosophy quite different from that of Whitehead. Subsequently, Davidson did his dissertation on Plato's *Philebus***

According to Davidson, "The central thesis that emerged was that when Plato had reworked the theory of ideas as a consequence of the explorations and criticisms of the *Parmenides, Sophist, Theaetetus,* and *Politicus*, he realized that the theory could no longer be deployed as a main support of an ethical position, as it had been developed in the *Republic* and elsewhere." Davidson's dissertation topic is mentioned only *in passim* in most encyclopedia entries. This is unfortunate, for one can see the development of Davidson's philosophical method in his dissertation. More important, one can trace Davidson's epistemological position back to Plato's.

Davidson's most profound influences on contemporary philosophy stem from his philosophy of mind and action. However, Davidson's philosophical positions in action theory and philosophy of mind are intrinsically tied into his work on the semantics of natural languages. I will treat these in turn. Davidson's apprenticeship in philosophy took place in a very different intellectual milieu than that of today. The middle of the century was dominated, at least in the Anglo-American philosophical community, by Logical Positivism. Davidson recalls that he got through graduate school at Harvard by reading an anthology of Logical Positivism by Feigl and Sellars. Logical positivism emerged in the Austro-Hungarian empire early in this century. Influenced by the logicist project of Bertrand Russell and Gottlob Frege on the one hand, and profound advances in science on the other, the Logical Positivists of the Vienna Circle turned to physics as a model of theoretical discourse and considered sensory experiences fundamental. Although Logical Positivism was not entirely a unified movement, one principle was more or less shared by major philosophers of that bent. This principle, known as the *Verification Principle*, states that the meaning of sentences can be accounted for in terms of experiences that would verify them. Logical Positivism also placed hopes in reductionism: the reduction of all special sciences to physics, and of all meaningful statements to reports about sensory experiences. In his famous paper, *Two Dogmas of Empiricism*, Davidson's teacher Quine challenged two central tenets of logical positivism: reductionism and the analytic/synthetic distinction. Davidson has been greatly influenced by Logical Positivism, but self-admittedly took up Quine's project and continued to challenge certain basic precepts. In fact, in his own paper, *On the Very Idea of a Conceptual Scheme*, Davidson does away with what he considers the third and last dogma of empiricism: the

dogma of the dualism of scheme and reality.

I will examine in detail two leading motifs in Donald Davidson's philosophy. One has to do with the fact that mental phenomena resist being "captured in the nomological net of physical theory." In the first section I will parse Davidson's argument for the rejection of strict psychophysical and psychological laws. The other motif concerns the problem of analyzing the explanatory force of agent's reasons for his actions. It is Davidson's contention that reason explanation is a form of causal explanation. The second part deals with the latter claim

---

ANOMALISM OF THE MENTAL. Simply put, "anomalism of the mental" amounts to the claim that the mental is not governed by laws as we usual understand them. In Davidson's own words:

> **There are no *strict deterministic* laws on the basis of which mental events can be predicted and explained (the Anomalism of the Mental).**

In developing his position, Davidson attempts to retain his materialism while at the same time avoid a reductionism, which generally has been held to have followed from materialism. When Davidson asserts that there can be no laws on the basis of which mental events can be predicted and explained, he has two different types of laws in mind. In the first type of law, an attempt is made to link mental states and events with physical states and events, and to try to explain the former on the basis of the latter. Davidson spends much of his effort in *Mental Events* showing the impossibility of such psychophysical laws. In the second type of law, there is an attempt to formulate strict deterministic laws linking mental states and events to other mental states and events. Davidson denies the possibility of such psychological laws as well. Davidson's latter claim amounts to the rejection of the science of psychology *tout court*.

In arguing against the possibility of psychophysical laws, Davidson has in mind the following kinds of laws:

> **(BL) x (x is in M iff x is in P)**

where M denotes some mental state or event and P denotes some physical state or event. The laws of the above kind are known as bridging laws. A stronger version of a bridging law claims identity of properties from different theoretical discourses. A weaker version claims only that whenever an object instantiates one property it instantiates the other. An important distinction between *laws* and *generalizations* must be made before we proceed any further. There has been general agreement among philosophers (Davidson included) that a law is distinguished from a mere generalization by the following features:

1. **A law must support counterfactual claims. A law of the form "All A are B," for instance, is said to sustain the claim that if any arbitrary x were an A, it would also be B.**
2. **It must be capable of confirmation by observable instances.**

To illustrate the difference between generalizations that happen to be true, and laws, consider the following story (adopted from Jaegwon Kim). All objects in a fixed domain (for instance all objects in my room) are either blue or red. In addition, all of the above objects are considered either edible or inedible. By some coincidence it so happens that all red objects in my room are edible. This allows us to form a true generalization about this fixed domain:

1. **if x is red then x is edible.**

It is obvious that (G) does not support counterfactual conditionals. For instance (G) does not allow us to infer of some green object (say a copy of Davidson's *Essays on Actions and Events*) that if it were red it would be edible. Davidson is quite explicit that his attack is aimed at psychophysical *laws* not at true psychophysical generalizations:

> **The thesis is rather that the mental is nomologically irreducible: there may be true general statements relating the mental and the physical, statements that have the logical form of a law; but they are not lawlike (in a strong sense to be described). If by absurdly remote chance we were to stumble on a nonstochastic true psychophysical generalization, we would have no reason to believe it more than roughly true.**

Following this view, it is important to keep in mind the fact that whether any given psychophysical generalization is true is a contingent empirical matter. As we will see later, it is an *a priori* matter that no such generalization can be a law.

The core idea of Davidson's argument against possibility of psychophysical laws can be found in the following passage:

> **Nomological statements bring together predicates that we know a priori are made for each other - know, that is, independently of knowing whether the evidence supports a connection between them.**

If we can know *a priori* when the predicates *are* made for each other then we can know by the same token when they *aren't*. Davidson finds that it is an *a priori* truth that mental and physical predicates are not made for each other. The structure of the argument is the following:

1. **Both mental and physical phenomena have distinct sets of features characteristic of their own domains, but incompatible with each other.**
2. **Bridging laws linking properties from two distinct theoretical discourses (in this case mental and physical) would transmit properties from one discourse to another, which in case of mental and physical phenomena would lead into incoherence.**
3. **Therefore, there could be no psychophysical laws linking mental and physical phenomena.**

    According to Davidson, the paradigmatic criterion of the mental events is their susceptibility to the description "in terms of vocabulary of propositional attitudes." Propositional attitudes or intentional states as they are sometimes called are various cognitive attitudes (that of hope, fear, desire, etc.) that one and the same person or different people can have toward the same proposition. For instance you and I can bear different cognitive attitudes toward the proposition 'Snow is white.' I might hope that snow is white, whereas you might simply believe that it is, etc. The proposition itself, viz., that snow is white, towards which one has an attitude is said to give the content to one's mental state.

    Propositional attitudes have certain features (or are constrained by certain principles) that distinguish them from physical states and events. Davidson's theory of propositional attitudes is guided by conclusions drawn from the project of Radical Interpretation. Imagine that you have encountered a group of people in an unfamiliar land who display what appear to be shared verbal and non-verbal behavior. Assigning meaning to their actions (of which linguistic utterances is a subclass) is the task of Radical Interpretation. The principles and techniques we would apply in the above described situation are not unlike the principles and techniques we commonly apply in interpretation of other people's actions and utterances

whose language we share. Radical interpretation, according to Davidson, is guided by normative principles and must proceed holistically.

> **This method is intended to solve the problem of the interdependence of belief and meaning by holding belief constant as far as possible while solving for meaning. This is accomplished by assigning truth conditions to alien sentences that make native speakers right when plausibly possible, according, of course to our own view of what is right.**

These general normative principles that guide the task of radical interpretation, and therefore constrain the task of attribution of propositional attitudes, are principles like 'don't believe an open contradiction,' or 'if you believe that *p* and *q* then believe that p.' It is important to keep in mind the fact that intentional states are capable of justifying other intentional states. In physical theory the movement of one ball is explained by the movement of the other. Having a belief that pressing on a lever will stop the flow of water doesn't just explain my action of stopping the flow of water. This belief (together with the desire to stop the flow of water)also justifies my action in the sense that it makes it reasonable in the light of the above belief. More on this in the second part of my paper. Davidson is explicit that it is a part of what it *is* for something to be a propositional attitude (like a belief) that it be subject to these normative principles. This makes these principles *a priori* and necessary constitutive of the concept of propositional attitudes. In contrast our knowledge of things physical is *a posteriori* and contingent in nature.

So far I have spent time explaining the normative character of the mental. I also mentioned that the interpretation must proceed holistically:

> **There is no assigning beliefs to a person one by one on the basis of his verbal behavior, his choices, or other local signs no matter how plain and evident, for we make sense of particular beliefs only as they cohere with other beliefs, with preferences, with intention, hopes, fears, expectation, and the rest.**

It can be seen from the above remark that mental is holistic in a sense that the attribution of each individual mental state to another person must be made against the background of attribution of other mental states. In addition, the attribution to an agent of the entire system of propositional attitudes is further constrained by considerations that involve maximization of coherence and rationality.

Davidson is quite aware of the fact that holism and interdependence are common to physical theory. In physical theory such *a priori* facts as the transitivity of 'longer than' is what makes physical measurements possible. Thus, the physical realm is also characterized by the *a priori* laws constitutive of our conception of the physical. What sets the realms of the mental and the physical apart is the disparate commitments of each realm. Rationality and the governing normative principles are essential characteristics of the mental. Thus, the absence of rationality and normative principles is a characteristic of the physical. If there were bridging laws we would find that the characteristics of the mental that have "no echo in physical theory" would be transmitted to the physical and *vice versa*. In the first of the above scenarios we would have to apply the Principle of Charity with its rule of maximization of coherence and rationality to the physical, which, according to Davidson, is plain absurd. In the second scenario we would have the principles governing the attribution of the mental be

preempted by the merely physical constraints. This happens for the following reason. If there *were* bridging laws of the type (BL), then neural states of the brain would be nomologically coextensive with certain intentional states. But neural states (being theoretical states of physical theory) are governed by conditions of attribution that in turn are regulated by the constitutive rules of the physical theory. Thus, constitutive rules of the mental are ignored in this scenario. Davidson concludes that:

> There are no strict psychophysical law because of the disparate commitments of the mental and physical schemes. It is a feature of physical reality that physical change can be explained by laws that connect it with other changes and conditions physically described. It is a feature of the mental that the attribution of mental phenomena must be responsible to the background of reasons, beliefs, and intentions of the individual. There cannot be tight connections between the realms if each is to retain allegiance to its proper source of evidence.

It is important for Davidson to note that the mental does have its own laws, for instance, the laws of rational decision making. The crucial difference between such laws and the laws that could be counted as psychophysical is the difference between the *normative* character of the former and the *predictive* power of the latter. When anomalism of the mental denies the existence of psychophysical and psychological laws, the sense of 'law' is taken to involve strict nomological predictions and explanations of behavior. Thus, normative 'laws' are quite compatible with anomalism of the mental. The question of whether Davidson's notion of what constitutes a "law" has merit or a wide following is beyond of the scope of this paper.

As I mentioned at the beginning of this section, the claim of the anomalism of the mental consists of two subsidiary claims. Thus far we have considered the support for the claim that there are no *psychophysical* laws. Davidson also defends the claim that there could be no precise *psychological* laws, i.e. there are no precise laws that relate mental states and events to other mental states and events. The argument for this claim can be found in 'Psychology as Philosophy.' As the title suggests, Davidson intends to contrast the claim that psychology is more like philosophy with the claim that it is more like science and then refute the latter claim. One point deserves special attention before we proceed to the exegesis of Davidson's argument against psychological laws. Actions, although undeniably physical under some descriptions, are considered to be mental by Davidson. This is so because, when we state which *action* someone is performing versus merely describing the *physical movement* his body is undergoing, we are contributing to our interpretation of him and interpretation, as we have seen, is guided by certain normative constraints. Thus, the laws that could relate an agent's mental states to his actions would count as psychological laws.

The gist of the argument against psychological laws can be found in the following passage:

> It is an error to compare truism like 'If a man wants to eat an acorn omelette, then he generally will if the opportunity exists and no other desire overrides' with a law that says how fast a body will fall in a vacuum. It is an error, because in the latter case, but not the former, we can tell in advance whether the condition holds, and we know what allowance to make if it doesn't.

If the above truism were a psychological law, then for the antecedent to obtain, the agent must want to eat an acorn omelette. But our knowledge of an agent's desires crucially

depends upon our attribution of *other* mental states to him. In addition, knowing his action subsequent to his desire will help us interpret whether the agent had the desire in the first place. Thus both the antecedent and the consequent of the supposed psychological law are related to each other through the holism of interpretation.

What is needed in the case of action, if we are to predict on the basis of desires and beliefs, is a quantitative calculus that brings all relevant beliefs and desires into the picture. There is no hope of refining the simple pattern of explanation on the basis of reasons into such a calculus.

Since no such hope exists, any psychological generalization purporting to be law must rely upon generous escape clauses such as 'if no other desire overrides,' *ceteris paribus*, etc. The necessity of such failsafe clauses is dictated by the fact that for Davidson there is no "underlying mental reality whose laws we can study in abstraction from the normative and holistic perspectives of interpretation."

CAUSAL EXPLANATION OF ACTION. Actions, according to Davidson, are events. Events, in his ontology, are particular dated occurrences; the essential feature of which is susceptibility to redescription. In order to admit an entity into one's ontology, one must specify the conditions of individuation for that entity. On Davidson's view:

> **[E]vents are identical if and only if they have exactly the same causes and effects. This criterion may seem to have an air of circularity about it, but if there is circularity it certainly is not formal. For the criterion is simply this: where *x* and *y* are events,**
>
> **(*x* = *y* if and only if ((*z*) (*z* caused *x* *z* caused *y*) and (*z*) (*x* caused *z* *y* caused *z*)).**

It is important to keep in mind that for an event to be an action, the event must be describable in a specific way. Actions are events that people perform *with intentions and for reasons*. One and the same action can be specified as intentional under some description and as purely physical under other description. But in order to be an action an event must have at least one description under which it is specified as intentional. The above requirement for an action hinges on the larger distinction between specifying the whole of an event with wholly specifying it. The distinction comes up in the context of discussion of causation and causal explanation:

> **The salient point that emerges so far is that we must distinguish firmly between causes and the features we hit on for describing them, and hence between the question whether a statement says truly that one event caused another and the further question whether the events are characterized in such a way that we can deduce, or otherwise infer, from laws or other causal lore, that the relation was causal.**

In the case of one event causing another, any description that *picks out* the right event specifies the whole of the cause. Some descriptions, of course, will be richer in the information they disclose about an event. This richness should not effect in any way how much of a cause they refer to. The story is quite different when it comes to what Davidson calls 'the further question' of causal explanation. Causal explanations are by their very

nature attempts to explain events in terms of the causes of these events. But, according to Davidson, causal *explanations* are, in addition, sensitive to how the events in question are described. For instance, the two descriptions 'Jack's walking in the room' and 'Jack's stomping in the room' may refer to the same event that caused Jill to wake up. However the latter may serve as a causal explanation of Jill's waking up, whereas the former may not.

One of Davidson's major contributions to philosophy of action is his claim that reason explanation is a form of causal explanation. In order to understand Davidson's claims that reasons are the causes of the actions they are reasons for and that reason explanation is a form of causal explanation, we must understand how on his view causal explanation works.

There have been two opposing approaches taken to a theory of causal explanation. One theory that takes its roots in Hume's position that (arguably) states that wherever there is a causal relation between two distinct events *a* and *b* there must be a law relating two types of events *A* and *B* that the events in question instantiate. This position has been further developed in the middle of the twentieth century by Carl Hempel into a deductive-nomological theory (DN from now on). According to DN, an event *E* is causally explained just in case the statement asserting the occurrence of *E* deductively follows from

1. **the statement asserting the occurrence of its cause *C* , and**
2. **the statement of some general causal law *L*.**

The opponents of the DN model argue that one can judge that an event *a* caused an event *b* without knowing the laws that these events instantiate. Davidson contends that the opposition between the opponents and the champions of the DN model is more apparent than real. The solution to the conflict depends on the distinction between events and their descriptions:

> **Causality and identity are relations between individual events no matter how described. But laws are linguistic; and so events can instantiate laws, and hence be explained or predicted in the light of laws, only as those events are described in one or the other way.**

In short, Davidson lends his support to the principle of Nomological Character of Causality. This principle "says that when events are related as cause and effect, they have descriptions that instantiate a law. It doesn't say that every true singular statement of causality instantiates a law." It is worth noting that Davidson accepts this principle on faith, as many commentators have pointed out. Unlike David Hume, who accepted the principle because his analysis of the nature of causation as a constant conjunction required it, Davidson disavows analyzing the nature of causation itself. His goal, explicitly stated, is to provide an analysis of the logical form of causal statements.

We can now turn to the question of the causal explanation of action. I will briefly discuss Davidson's impetus for his claim that reason explanation must be a form of causal explanation. Davidson's opponents (the anti-causalists) on the explanation of actions claimed that reason explanation is different in *kind* from causal explanation. There are two main types of arguments for the anti-causalist position: *methodological* and *conceptual*. Anti-causalists, who relied on methodological arguments for their position, claimed that a DN model that relies on the concept of *lawful regularity* has a place only in the physical

sciences. By contrast, the primary constraint placed on explanation in the social sciences is a *normative* one. Thus, lawful regularities relating reasons to actions would be simply irrelevant to explanation in social sciences according to anti-causalists.

Conceptual arguments are meant to establish the stronger claim that reasons cannot in principle be causes. One (more plausible) argument of the conceptual variety rests on the assumption that "the presence of a reason cannot be ascertained independently of the occurrence of the action it rationalizes." This, presumably, leads to the disparate evidential commitments of the causal explanation and reason explanation. Davidson himself appears to advocate the above point in the passage quoted above. Thus, all arguments against the causalist position, including the ones briefly mentioned above, revolve around the normative constraints placed on the explanation of the mental.

In short, an explanation of an agent's action can be considered adequate only if it shows the action in question to be reasonable against the background of agent's beliefs and desires. This latter condition together with the truth condition, which states that propositional attitudes a rationalization attributes to an agent must be true, form the necessary conditions for the *justification model* of explanation. Davidson considers the above conditions necessary but not sufficient. The deficiency of the justification model is explained by drawing attention to the distinction between having *a* reason for an action and having *the* reason why one performs an action. For *a* reason to be *the* reason why one performs an action the reason must cause the action. For example, I have *a* reason to turn on the television, say, to watch my favorite TV show. But this is not *the* reason why I turned the television. This is because the above reason did not cause me to turn on the television. As Davidson puts it,

> [S]omething essential has certainly been left out, for a person can have a reason for an action, and perform the action, and yet this reason not be the reason why he did it.

In my case *the* reason for me to turn the television was the fact that I wanted it to keep me company. Thus, one reason, (viz., to keep me company) was the *cause* of my action while the other reason (viz., to watch my favorite show) wasn't. Davidson continues

> Of course, we can include this idea too in justification; but then the notion of justification becomes as dark as the notion of reason until we can account for the force of that 'because'.

The mere possibility that a person acted on the basis of one reason when s/he possesses two or more presents an insurmountable obstacle. The anti-causalist has no way of accounting for the force of the 'because' in the rationalization. Thus, the justification model is silent on what would count as the correct rationalization. The only solution, according to Davidson, is to view the efficacious reasons (the ones that account for the correct rationalization) as causes of action. This leaves us, according to Davidson, with only one alternative to justificationalism, viz., the view that reason explanation is a species of causal explanation.

English Deism

LORD HERBERT OF CHERBURY. The beginnings of English Deism appear in the seventeenth century. Its main principles are to be found in the writings of Lord Herbert of Cherbury (d. 1648), who devoted the latter part of a life spent in a military and diplomatic career to a search for a standard and a guide in the conflicts of creeds and systems. He was a friend of Grotius, Casaubon, and Gassendi, and during a long sojourn in France made himself acquainted with the thought of Montaigne, of Bodin, and especially of Charron. His works are: *De Veritate* (Paris, 1624); Cherbury. *De religions Gentilium errorumque apud eos causes* (London, 1645); and two minor treatises, *De cause errorum* and *De religions laici*. The first work advances a theory of knowledge based upon the recognition of innate universal characteristics on the object perceived, and rigidly opposed to knowledge supernatural in its origin and determinable in only by strife and conflict. The second work lays down the common marks by which religious truth is recognized. These are (1) a belief in the existence of the Deity, (2) the obligation to reverence such a power, (3) the identification of worship with practical morality, (4) the obligation to repent of sin and to abandon it, and, (5) divine recompense in this world and the next. These five essentials (the so-called "Five Articles" of the English Deists) constitute the nucleus of all religions and of Christianity in its primitive, uncorrupted form. The variations between positive religions are explained as due partly to the allegorization of nature, partly to self-deception, the workings of imagination, and priestly guile.

Herbert's influence disappeared in the storms of the Puritan Revolution, and Deism found the most important impetus supplied to its progress in ecclesiastical circles. The learning of the Renaissance had served to incline the clergy of the Establishment to a moderate rational theology, and in the conflict between Puritans and Anglicans, and between Roman Catholics and Protestants, it became common to invoke Reason as arbiter. Later Deists could appeal to the arguments of leading theologians, as well as to those of the Cambridge Platonists, who, in their conflict against the sensualism of Hobbes, exalted the authority of moral intuitions. The Revolution served to intensify the growing feeling against what was arbitrary in religion, and emphasized the demand for subjective independence in the field of reason and the need of unity in the realm of practical morality.

HOBBES AND OTHERS. Rejection of theological supernaturalism stands out as the most conspicuous characteristic in Hobbes's philosophical writings (d. 1679), which were inspired by the teachings of the new mathematical and natural sciences. The different religions are explained as the product of human fear interpreting natural phenomena in anthropomorphic form, or, in their higher aspects, as the outcome of reflection on causal relation in the universe. Miracles and revelations are in themselves improbable, and may be most easily explained as the imaginings of the ignorant. Positive religion is the creation of the State, and the sovereign justly possesses unconditional power to enforce its prescriptions, for only in this way can religious strife be avoided. Between religion thus naturally explained and a prophetic and Christian revelation

Hobbes, nevertheless, attempted to mediate; he mentions as the means that might lead to such a reconciliation the rational interpretation of miracles, the differentiation between the inner moral sense of Scripture and mere figurative expression, and the historical criticisms of Biblical sources. The entire apparatus of Rationalism is here to be found, limited only in its application. Further, Spinoza's *Tractatus theologico-politicus* (1670) and Bayle's *Dictionnaire* (1695-97) were effective in shaping the character of Deism. Of no small importance, also, was the rise of a literature of comparative religion and the publication of ethnographical studies and works of travel. China, Arabia, Egypt, Persia, India, and primal regions, were brought within the horizon of religious investigation. Philosophy, beginning with Locke's theory of knowledge, and natural science, with Newton's theory of gravitation, contributed to the opposition with which theological dogma was confronted. Yet their attitude was not one of hostility to religions which they sought rather to utilize for the purpose of establishing the desired universal standard of truth. Newton and Boyle succeeded in reconciling the creed of the Church with their mechanical metaphysics; and this union remained characteristic of England, so that even men like Priestley and Hartley did not shrink from supporting their materialistic theories by theological arguments. We have here the blending of a sensualistic epistemology, a mechanical-teleological metaphysics, a historical criticism, and an *a prioristic* ethics whose product in the shape of natural religion was destined first to undermine Christianity, then to compete with it, and finally to supplant it.

CHARLES BLOUNT. These various tendencies could not show themselves fully under the ecclesiastical restraint of the Restoration, yet they appear clearly enough in the writings of Charles Blount (d. 1693), usually placed second to Herbert in the lists of Deists. Like his predecessor, Blount dwells on the conflict between rival religions, and finds a standard of adjustment in a fusion of Herbert's theory of universal characteristics with Hobbes's prescription by the State. Like Hobbes and Spinoza, he touches serious problems of Biblical criticism at this early date. Freedom from prejudice is his boast; he asserts the supernatural character of Christianity on the basis of its miracles, after he has already rendered them dubious by parallels with non-Christian miracles. His works were: *Anima mundi* (London, 1679), *Great is Diana of the Ephesians* (1680), and *The Two First Books of Philostratus concerning the Life of Apollonius Tyaneus*, published in English with notes (1680).

JOHN LOCKE. The Revolution of 1688, the establishment of the freedom of the press in 1694, the political favor that was bestowed on the new tendencies in theology, in opposition to the stricter Anglicanism which was tainted with Stuart partizanship, were conditions favorable to the development of the seed that had already been planted. Parallel with the liberalization of orthodox dogma, there ran a more radical development with the attainment of a standard for the testing of the contents of revelation. Of surpassing importance in this direction was the influence and work of John Locke (d. 1704), who, in the field of theology, found his starting point, like most prominent thinkers of the age, in the conflict of systems, doctrines, and practices. Out of his reflections on the data of experience he developed a mechanical-teleological metaphysics and an empirical-utilitarian ethics, the latter agreeing, with the old idea of *lex naturae* in that ethical experience merely confirms the connection established by a teleological government of the universe between certain acts and their consequences. In spite of his supernaturalist tendencies, Locke nevertheless maintained, in his *Letters on Toleration* (1689-92), that only rational demonstration, and not compulsion or mere assertion, can establish the validity of revelation. In the *Essay concerning Human Understanding* (1690) he had investigated the conception of revelation from the epistemological standpoint, and laid down the criteria by which the true revelation is to be

distinguished from other doctrines which claim such authority. Strict proof of the formal character of revelation must be adduced; the tradition which communicates it to us must be fully accredited by both external and internal evidence; and its content must be shown to correspond with rational metaphysics and ethics. Revelation is revelation; but, after it is once given, it may be shown *a posteriori* to be rational, i.e., capable of being deduced from the premises of our reason. Only where this is possible is there a presumption in favor of the purely mysterious parts of revelation. Where these criteria are disregarded the way is open to the excesses of sects and priesthoods by which religion, the differentia of reasoning man, has often made him appear less rational than the beasts. Locke advances therefore the remarkable conception of a revelation that reveals only the reasonable and the universally cognizable. The practical consequences of the thesis are deduced in *his Reasonableness of Christianity as Delivered in the Scriptures* (1695), which aims at the termination of religious strife through the recovery of the truths of primitive, rational Christianity. From the Gospels and the Acts, as distinguished from the Epistles, he elicits as the fundamental Christian truths the doctrine of the messiahship of Jesus and that of the kingdom of God. Inseparably connected with these are the recognition of Jesus as ruler of this kingdom, forgiveness of sins, and subjection to the moral law of the. kingdom. This law is identical with the ethical portion of the law of Moses, which in its turn corresponds to *the lex naturae or rationis*. The Gospel is but the divine summary and exposition of the law of nature, and it is the advantage of Christianity over pagan creeds and philosophies that it offers this law of nature intelligibly, with divine authority, and free from merely ceremonial sacerdotalism. To do this it requires the aid of a supernatural revelation, whose message is attainable through reason also, but only in an imperfect way.

TOLAND, COLLINS, AND OTHERS. Deducing the full consequences of Locke's theory, John Toland (d. 1722), in his *Christianity not Mysterious* (1696), maintained that the content of revelation must neither contradict nor transcend the dictates of reason. Revelation is not the basis of truth, but only a " means of information " by which man may arrive at knowledge, the sanction for which must be found in reason. Primitive Christianity knew nothing of mystery, whose sources are Judaic and Greek, and the original Christian use of the word *mysterium* conveyed no idea of that which transcended reason. The basis is thus laid for the critical study of early Christianity. Further problems of Biblical criticism and the distinction between the diverse parties in primitive Christianity are advanced in Toland's *Amyntor* (1699) *and Nazarenus ; or Jewish, Gentile and illahometan Christianity* (1718). In like manner, Anthony Collins (d. 1729), in his *Discourse of Freethinking* (1713), developed the consequences of Locke's propositions. Revelation depends for its sanction upon its agreement with reason, and what is contrary to reason is not revelation. Practical morality is independent of dogma, which, on the contrary, has been the cause of much evil in the history of the world. Christ and the Apostles, the prototypes. of the freethinkers, never made use of supernatural authority, but confined themselves to simple, rational demonstration. Collins's work elicited numerous replies; but none really made answer to his main thesis. After remaining silent for eleven years, Collins renewed the contest with a contribution on prophecy and miracles. Setting out from Locke's proposition that revelation was truth sanctioned by reason, he found it a simple step to reject prophecy and miracles as non-essential characteristics of religion, amounting at most to mere didactic devices. The mathematician William Whiston (d. 1752) gave a new impulse to the controversy by the publication of *The True Text* (1722), in which the lack of real concordance between the New Testament interpretation of Old Testament prophecies is pointed out, and the prevailing allegorical method of reconciling such differences summarily rejected. The

present form of the Old Testament is characterized as a forgery perpetrated by the Jews, and an attempt is made by Whiston to restore the original text. Collins, in his *Discourse on the Grounds and Reasons of the Christian Religion* (1724), agreed with Whiston as to the discrepancies between the two Testaments, but defended the allegorical method of interpretation. Thomas Woolston (d. 1733) came to the support of Collins in this controversy over the Biblical prophecies; and when his opponents shifted their appeal from the prophecies to the miraculous acts of Jesus he applied his destructive allegorical method to those also, in his *Discourses on the Miracles of our Saviour* (1727-30).

MATTHEW TINDAL. Matthew Tindal (d. 1733), in his dialogue *Christianity as Old as the Creation, or the Gospel a Republication of the Religion of Nature* (1730), produced the standard text-book of Deism. Proceeding from Locke's proposition of the identity of the truths of revelation with those of reason, he adduces a new array of arguments in support of that position. The goodness of God, the vast extent of the earth, the long duration of human life on earth render it improbable that only to Jews and Christians was vouchsafed the favor of perceiving truth. We now have brought in the classic example of the three hundred million Chinese who surely could not all be excluded from the truth, and Confucianism begins to be extolled against much that is repugnant and harsh in the Mosaic law. Christianity, to be the truth, must find the substance in all religions; it must be as old as creation. The doctrines of the fall and of original sin can not stand, since it is irrational to believe in the exclusion from the truth of the vast majority of humanity. Tindal's position is orthodox to the extent that Judaism and Christianity are acknowledged as revelations, though revelations only of the *lex naturae*, which is identified with natural religion, the primitive, uncorrupted faith, consisting in "the practise of morality in obedience to the will of God." An echo of the teachings of Tindal is found in Thomas Chubb (d. 1747), whose *True Gospel of Jesus Christ* (1738) attempts to prove that what Jesus sought to teach his followers was but natural morality, or the law of nature.

MORGAN, ANNET, AND MIDDLETON. Thomas Morgan (d. 1743) continued Tindal's argument on its historical side in *The Moral Philosopher* (1737-40),displaying much originality in tracing the development of heathen religions, as well as of Judaism and Christianity. Abandoning the old method of deriving specific religions from priestly deception, he explains their rise through the gradual supplanting of the one God of the law of nature by a crowd of divinities connected with definite natural phenomena. The legislation of Moses, under Egyptian influences, imposed a rigid and nationally restricted form upon the *lex naturae*, and the Jewish ritual and ceremonial is in essence a purely political institution. Full revelation of the law of nature came with Christ, who gave to the world in concentrated form the truth that had already been revealed to Confucius, Zoroaster, Socrates, and Plato. The protagonist of this divinely revealed truth after Christ was Paul, who, in his form of expression, indeed, was compelled to make concessions to the influence of Judaism, and in whom, therefore, much is to be taken figuratively. Peter, on the other hand, and the author of the Apocalypse misunderstood the import of the revelation of Christ and corrupted it in the spirit of Messianic Judaism. Persecution forced the two tendencies into union in the Catholic Church, and the Reformation has only partially succeeded in separating them. Morgan's argument results, therefore, in the rejection of the formerly assumed identity between the law of Moses and the *lex naturm*, and the restriction of the latter, in the fullness of revelation, to Christianity. His conclusions were denied by William Warburton in *The Divine Legation of Moses* (1738-41). When the Christian apologists substituted for the argument from miracles the argument from personal witness and the credibility of Biblical evidence, Peter Annet (d. 1769), in his *Resurrection of Jesus*

(1744), assailed the validity of such evidence, and first advanced the hypothesis of the illusory. death of Jesus, suggesting also that possibly Paul should be regarded as the founder of a new religion. In *Supernaturals Examined* (1747) Annet roundly denies the possibility of miracles. Conyers Middleton (d. 1750) in his later writings sought to bridge over the gulf between sacred and profane history, and to test them equally by the same method. His *Inquiry into the Miraculous Powers* (1748) demonstrates that the belief in miracles is common to primitive Christianity and heathen creeds, and that it developed to great proportions in the later life of the Church,, so that one is then confronted with an endless succession of miracle to which belongs the same degree of credibility that the apologists attributed to the miracles of the Bible. Though special reference to the New Testament was omitted, Middleton propounded a question to answer which no serious attempt was mad when he asked why credence should be granted to one faith that is denied to another.

SHAFTESBURY, MANDEVILLE, DODWELL, BOLINGBROKE. The Deistic controversy died out in England about the middle of the eighteenth century. The Deistic literature had exhausted its stock of materials, while its tenets had never obtained a strong hold on the people. The cold, inflexible, rational supernaturalism of Paley (d. 1805) was considered as the final settlement of these long conflicts. From the beginning, however, there had been a class of critics, representatives of the old Renaissance spirit, and inimical, therefore, to the Stoic and Christian ethics, who had only partially shared the views of the Deists, and in some ways had advanced to a position far beyond them. Shaftesbury (d. 1713), in opposition to the utilitarian and supernaturalist ethics of Locke and Clarke, developed the conception of a strictly autonomous moral code having its basis in a moral instinct in man whose end is to bring individual and society to harmonious self-perfection. Bernard Mandeville (1733) adopted the Epicureanism of Hobbes and Gassendi, studied moral problems in the skeptical spirit of Montaigne and La Rochefoucauld, gave the preference to Bayle over the Deists, and developed empiricism into a sort of Agnosticism. He criticized the prevailing morality as a more conventional lie. Christianity-which the Deists had wished, while reforming, to maintain-he declared impossible, not only as a religion, but as a system of morality. His *Free Thought on Religion* (1720) has caused him to be included in the ranks of the Deists; but his real position is brought out in the *Fable of the Bees* (1714). Henry Dodwell (d. 1711), *in Christianity not Founded on Argument* (1742), attempted to demonstrate the invalidity of the rationalistic basis for Christian truth constructed by the Deists, from the very nature of the religious impulse, which, being opposed to rational argumentation, calls for the support of tradition and mystery, and finds fascination in the attitude of credo quia absurdum. The only proof proceeds from a mystic inner enlightenment; logical demonstrations like those of Clarke or the Boyle lectures are only destructive of religion. Bolingbroke (d. 1751) voices the French influence in a capricious and dilettante manner. Despising all religions as the product of enthusiasm, fraud, and superstition, he nevertheless concedes to real Christianity the possession of moral and rational truth; an advocate of freedom of thought, he supports an established church in the interest of the State and of public morals (*Letters on the Study and Use of History* 1752; *Essays*, 1753).

HUME'S INFLUENCE. Far greater is the influence of David Hume (d. 1776), who summarized the Deistic criticism and raised it to the level of modern scientific method by emancipating it from the conception of a deity conceived through the reason and by abandoning its characteristic interpretation of history. He separates Locke's theory of knowledge from its connection with a scheme of mechanical teleology and confines the human mind within the realm of sense perception. Beginning then with the crudest factors of experience and not with a religious and ethical norm, he

traces the development of systems of religion, ethics, and philosophy in an ascending course through the ages. He thus overthrow the Deistic philosophy of religion while lie developed their critical method to the extent of making it the starting-point for the English positivist philosophy of religion. Distinguishing between the metaphysical problem of the idea of God and the historical problem of the rise of religions, lie denied the possibility of attaining a knowledge of deity through the reason, and explained religion as arising from the misconception or arbitrary misinterpretation of experience (*Dialogues Concerning Natural Religion*, written in 1751, but not published till 1779; *Natural History of Religion*, 1757). Against the justification of religion by other means than rational Hume directs his celebrated critique of miracles, in which to the possibility of miraculous occurrences he opposes the possibility of error on the part of the observer or historian. Human experience, affected by ignorance, fancy, and the imaginings of fear and hope, explains sufficiently the growth of religion. Hume's contemporaries failed to recognize the portentous transformation which he had effected in the character of Deism. The Scottish "common-sense school " saved for a time the old natural theology and the theological argument from miracles to revelation; but in reality Hume's skeptical method, continued by Hamilton and united to French Positivism by Mill and Browne, became, in connection with modern ethnology and anthropology, the basis of a psychological philosophy of religion in which the data of outward experience are the main factors (Evolutionism, Positivism, Agnosticism, Tylor, Spencer, Lubbock, Andrew Lang). In so far as Hume's influence prevailed among his contemporaries, it may be said to have amalgamated with that of Voltaire; the "infidels," as they were now called, were Voltairians. Most prominent among them was Gibbon (d. 1794), whose *Decline and Fall* offers the first dignified pragmatic treatment of the rise of Christianity. The fundamental principles of Deism became tinged in the nineteenth century with skepticism, pessimism, or pantheism, but the conceptions of natural religion retained largely their old character.

French Deism

With other English influences Deism entered France, where, however, only its materialistic and revolutionary phases were seized upon, to the exclusion of that religiosity which had never been lost in England. French Deism stood outside of theology. The English writers who came to exercise the greatest influence were Hobbes, Locke, Shaftesbury, Pope, Bolingbroke, and Hume. Of the true Deists only Collins, the most critical and the least theological, became prominent.

VOLTAIRE. Voltaire (d. 1778) embraced the conception of natural religion with ardor, and entered into a polemics against intolerance in Church and State relations as well as against the philosophy of the Church and the prevailing religious Cartesianism (*Essai sur les mmurs et l'esprit des nations*, 1754-58*; Dictionnaire philosophique*, 1764). He derived his natural philosophy from Newton and Clarke, his theory of knowledge and his ideas on toleration from Locke, the main principles of his ethics from Shaftesbury, his critical method and the conception of natural religion from the Deists. All phenomena are explained historically by the interaction between man and his environment, and all things are governed by God acting only in accordance with natural laws. Natural morality and religion are not entirely innate ideas, but rather simple and universally prevalent conditions standing in need of development and following a course that leads through errors arising from ignorance and fear to an ultimate standard truth which is characterized as the "fruit of the cultivated reason." Deism is thereby emptied of all religious content and restricted to the field of morals and rational metaphysics.

All that is essentially characteristic of human nature is the same everywhere; all that depends on custom varies. The chief influences for changes in the human mind are climate, government, religion, and in opposition to these one should seek to arrive at the underlying, undiversified unity. "Dogma leads to fanaticism and strife; morality everywhere inspires harmony." The rise of positive religions may be studied psychologically in children and savages. Fear and ignorance of the law of nature are the primary causes; the parallel growth of social groups and the need of authority cooperate. In China alone natural religion has escaped this pernicious development. India be came the home of theological speculation, and influenced the religions of the West, of which the most important was Judaism as the parent of Christianity and Islam. Moses was a shrewd politician; the prophets were enthusiasts like the dervishes, or else epileptics; Jesus was a visionary like the founder of the Quakers, and his religion received life only through its union with Platonism. Voltaire's conception of the evolution of history entered deep into European thought. By the side of the party of the juste milieu and of good sense," of which Voltaire is the most prominent representative, there arose a school which carried the doctrines of mechanism and sensualism to their furthest consequences. and evolved a philosophy of materialism.

ENCYCLOPEDISTS. The Encyclopedists removed from Deism the great factor of natural religion, retaining only its critical method as applied to the history of religion. The head of this school was Denis Diderot (d. 1784), and its great organ of expression was the *Encyclopedie*. The

state censorship, however, compelled the projectors to call to their aid a number of contributors of conservative views and to bring their skeptical method to the task of defending the compromise between reason and revelation. In this spirit the main religious topics were treated, but by a subtle infusion of the spirit of Bayle and the expedient of cross-references from these articles to topics which might be handled with greater freedom, Diderot succeeded in supplying the desired corrective. It was the circle of Holbach (d. 1789) that dared to apply the most extreme consequences of materialism to religious questions. Helvetius (d. 1771) prepared the way with his *De l'esprit* (17,58), in which he expounded a materialistic psychology and ethics. Their moral theories, deriving though they did from Hobbes and Hume, lost all connection with the position of Deism, which became for them a mere armory of weapons for the destruction of all religion with its consequences, intolerance and moral corruption. Holbach is undoubtedly the author of the *Systeme de la nature*, which appeared in 1770 as the work of Mirabaud. The *Systeme* is not original in ascribing the beginnings of religion to human hope and fear and to ignorance of the laws of nature. Fraud, ambition, and unhealthy enthusiasm have made use of it as a means of political and social influence and have succeeded in crystallizing its primitive emotions into positive creeds, within which animistic tendencies have been developed and subtilized into systems of metaphysics and theology -- the sources of irrational intolerance. From Holbach and his circle, and from the cognate group of the Encyclopedists, proceeded the so-called ideological school, who held the main problem of philosophy to be the analysis of the mental conceptions aroused by sensations from the material world (Condorcet, Naigeon, Garat, Volney, Dupuis, Saint-Lambert, Laplace, Cabinis, De Tracy, J. B. Say, Benjamin Constant, Bichat, Lamarck, Saint-Simon, Thurot, Stendhal). Out of this school, in turn, developed the positivism of Comte.

ROUSSEAU. J. J. Rousseau (d. 1778) gave quite a different tendency to Deism. Accepting in the main the sensualism of Locke and the metaphysics of Clarke and Newton, he maintains after the manner of Shaftesbury and Diderot a belief in inborn moral instincts which he distinguishes as " sentiments " from mere acquired ideas; he is true to the position of Deism in connecting this moral "sentiment " with a belief in God, and he protests against the separation between the two which the skepticism of Diderot had brought about. He was influenced by Richardson, as well as by Locke. "Sentiment " becomes the basis of a metaphysical system built up out of the data of experience under the influence of the Deistic philosophy, but redeemed from formalism by constant reference to sentimentality and emotion as the principal sources of religion. The nature of religion is not dogmatic but moralistic, practical, and emotional. Rousseau, therefore, finds the essence of religion, not (like Voltaire) in the cultivated intellect, but in the naive and disinterested understanding of the uncultured. Conscious, rational progress in civilization, no less than supernaturalism in Church and State, is an outcome of the fall, when the will chose intellectual progress in preference to simple felicity. With Rousseau natural religion takes on a new meaning; "nature" is no longer universality or rationality in the cosmic order, in contrast to special supernatural and positive phenomena, but primitive simplicity and sincerity, in contrast to artificiality and studied reflection. In his scheme of the rise of religions he gets out from the common standpoint of the discrepancies and contradictions prevailing among historic creeds. Yet positive religion to him is not so much the product of ignorance and fear as the corruption of the original instinct through the selfishness of man, who has erected rigid creeds that he might arrogate to himself unwarranted privilege or escape the obligations of natural morality., Something of the true religion is to be found in every faith, and of all creeds Christianity has retained the greatest measure of the original truth, and the purest morality. So sublime and yet so

simple does Rousseau find the Gospel that he can scarcely believe it the work of men. Its irrational elements he attributes to misconception on the part of the followers of Jesus and especially of Paul, who had no personal communication with him. It was natural that between the advocate of such views and the party of the materialists strife should rise, and in fact Rousseau's religious influence in France was slight. On the rising German idealism, however, he exercised a great influence.

Democritus (460-370 BCE.)

Democritus was born at Abdera, about 460 BCE, although according to some 490. His father was from a noble family and of great wealth, and contributed largely towards the entertainment of the army of Xerxes on his return to Asia. As a reward for this service the Persian monarch gave and other Abderites presents and left among them several Magi. Democritus, according to Diogenes Laertius, was instructed by these Magi in astronomy and theology. After the death of his father he travel in search of wisdom, and devoted is inheritance to this purpose, amounting to one hundred talents. He is said to have visited Egypt, Ethiopia, Persia, and India. Whether, in the course of his travels, he visited Athens or studied under Anaxagoras is uncertain. During some part of his life he was instructed in Pythagoreanism, and was a disciple of Leucippus. After several years of traveling, Democritus returned to Abdera, with no means of subsistence. His brother Damosis, however, took him in. According to the law of Abdera, whoever wasted his patrimony would be deprived of the rites of burial. Democritus, hoping to avoid this disgrace, gave public lectures. Petronius relates that he was acquainted with the virtues of herbs, plants, and stones, and that he spent his life in making experiments upon natural bodies. He acquired fame with his knowledge of natural phenomena, and predicted changes in the weather. He used this ability to make people believe that he could predict future events. They not only viewed him as something more than mortal, but even proposed to put him in control of their public affairs. He preferred a contemplative to an active life, and therefore declined these public honors and passed the remainder of his days in solitude.

Credit cannot be given to the tale that Democritus spent his leisure hours in chemical researches after the philosopher's stone -- the dream of a later age; or to the story of his conversation with Hippocrates concerning Democritus's supposed madness, as based on spurious letters. Democritus has been commonly known as "The Laughing Philosopher," and it is gravely related by Seneca that he never appeared in public with out expressing his contempt of human follies while laughing. Accordingly, we find that among his fellow-citizens he had the name of "the mocker". He died at more than a hundred years of age. It is said that from then on he spent his days and nights in caverns and sepulchers, and that, in order to master his intellectual faculties, he blinded himself with burning glass. This story, however, is discredited by the writers who mention it insofar as they say he wrote books and dissected animals, neither of which could be done well without eyes.

Democritus expanded the atomic theory of Leucippus. He maintained the impossibility of dividing things *ad infinitum*. From the difficulty of assigning a beginning of time, he argued the eternity of existing nature, of void space, and of motion. He supposed the atoms, which are originally similar, to be impenetrable and have a density proportionate to their volume. All motions are the result of active and passive affection. He drew a distinction between primary motion and its secondary effects, that is, impulse and reaction. This is the basis of the law of necessity, by which all things in nature are ruled. The worlds which we see -- with all their properties of immensity, resemblance, and dissimilitude -- result from the endless multiplicity of falling atoms. The human soul consists of

globular atoms of fire, which impart movement to the body. Maintaining his atomic theory throughout, Democritus introduced the hypothesis of images or idols (*eidola*), a kind of emanation from external objects, which make an impression on our senses, and from the influence of which he deduced sensation (*aesthesis*) and thought (*noesis*). He distinguished between a rude, imperfect, and therefore false perception and a true one. In the same manner, consistent with this theory, he accounted for the popular notions of Deity; partly through our incapacity to understand fully the phenomena of which we are witnesses, and partly from the impressions communicated by certain beings (*eidola*) of enormous stature and resembling the human figure which inhabit the air. We know these from dreams and the causes of divination. He carried his theory into practical philosophy also, laying down that happiness consisted in an even temperament. From this he deduced his moral principles and prudential maxims. It was from Democritus that Epicurus borrowed the principal features of his philosophy.

Demonax (2nd Cn. CE.)

Demonax was a philosopher of the second century CE. who tried to revive the philosophy of the Cynic School. Born in Cyprus, Demonax went to Athens, where he became so popular that people vied with on another in presenting him with food, and even the young children gave him great quantities of fruit. Much less austere than Diogenes, whom he took as his philosophic model, he nevertheless rebuked vice unsparingly, and was charged with neglecting the Eleusinian Mysteries, to which he replied: "If the mysteries are bad, no one should be initiated; and if they are good, they ought to be open to everyone." He was fried of Epictetus, who once rebuked him for not marrying, but was silenced by Demonax, who said, "Very well; give me one of your daughters for a wife" -- Epictetus being himself a bachelor. Demonax lived to be nearly a hundred, and on his death was buried with great magnificence. See the *Demonax* of Lucian, in which the character of the philosopher is painted in glowing colors.

René Descartes (1596-1650)

LIFE. Descartes was educated at a Jesuit college which was firmly grounded in the scholastic tradition. After furthering his education in Paris, he enlisted in the Dutch and, later, the Bavarian militaries. In 1629 Descartes moved to Holland where he lived in seclusion for 20 years, changing his residence frequently to preserve his privacy. During this period he produced the writings upon which his fame rests. His studies were first restricted to science, and only later did he explore metaphysics. In 1649, Descartes moved to Stockholm at the request of Queen Christina of Sweden who employed him as a philosophy tutor. Christina scheduled the lectures at 5 A.M. The early hours and harsh climate took their toll on Descartes's already weakened condition. He died shortly after in 1650. During his life, Descartes's fame rose to such an extent that many Catholics believed he would be a candidate for sainthood. As his body was transported from Sweden back to France, anxious relic collectors along the path removed pieces of his body. By the time his body reached France, it was considerably reduced in size.

Descartes' philosophy developed in the context of the key features of Renaissance and early modern philosophy. Like the humanists, he rejected religious authority in the quest for scientific and philosophical knowledge. For Descartes, reason was both the foundation and guide for pursuing truth. Although Descartes was a devout Catholic, he was also influenced by the Reformation's challenge to Church authority, particularly the challenge against medieval Aristotelianism. He was an active participant in the scientific revolution in both scientific method and in particular discoveries. Finally, and perhaps most importantly, Descartes reacted strongly against the Renaissance resurgence of ancient Greek skepticism. Thus, we find in Descartes' writings a relentless pursuit of absolute certainty.

DISCOURSE ON THE METHOD. Descartes' first discussion of scientific method is in an unfinished work of 1628 titled *Rules for the Direction of the Mind*. The first 12 of the planned 36 rules deal with the general aspects of his proposed methodology, and are considered early versions of principles which made their way into his later writings. In 1633 Descartes prepared for publication a work on physics called *Le Monde* which defended a heliocentric view of the universe. That same year the Catholic Church condemned Galileo's Dialogue (1632). Descartes did not think Galileo's views were prejudicial to religion and he worried that his own views might be censured. Thus he suspended publication of it. In 1637 Descartes published a collection of essays titled *Optics, Meterology, and Geometry*. Prefaced to these essays was a work titled "Discourse on the Method of Rightly Conducting the Reason and Seeking Truth in the Sciences." Most of the "Discourse" was written before the 1633 condemnation of Galileo's *Dialogue*. However, he later added a concluding section which explained that he insisted on publishing, in spite of political risks. The simple reason was that he counted on the public to help confirm his scientific theories. In the Discourse, Descartes offers a method of inquiry quite different from Bacon's. Whereas Bacon advocated induction, Descartes insists on a more deductive approach.

Most of the *Discourse* is autobiographical insofar as it traces Descartes intellectual development and how his method assisted him in his investigations. Descartes realized that he needed to reject much of the teachings of his youth. This raised the question as to exactly how he should proceed in replacing old theories with new ones. He found his answer by observing how old parts of cities are replaced with the new. The more elegant cities are those which are methodically built from scratch, not those which continually renovate old sections.

Descartes explains that he had learned a variety of methodological approaches in a variety of disciplines. They all had limits, though. Syllogistic logic, he believes, only communicates what we already know. Geometry and algebra are either too abstract in nature for practical application, or too restricted to the shapes of bodies. However, he believed that a more condensed and universal list of methodological rules was better than a lengthy and varied list.

The first of these was to accept nothing as true which I did not clearly recognize to be so; that is to say, carefully to avoid precipitation and prejudice in judgments, and to accept in them nothing more than what was presented to my mind so clearly and distinctly that I could have no occasion to doubt it.

The second was to divide up each of the difficulties which I examined into as many parts as possible, and as seemed requisite in order that it might be resolved in the best manner possible.

The third was to carry on my reflections in due order, commencing with objects that were the most simple and easy to understand, in order to rise little by little, or by degrees, to knowledge of the most complex, assuming an order, even if a fictitious one, among those which do not follow a natural sequence relatively to one another.

The last was in all cases to make enumerations so complete and reviews so general that I should be certain of having omitted nothing. Descartes commentator S.V. Keeling argues that Descartes' method, as expressed in the above rules, rests on three mental operations: intuition, deduction, and enumeration. These three abilities constitute our human reason. Intuition involves directly apprehending the simplest components (or "simple natures") of a subject matter. Deduction is not syllogistic, but a process of inferring necessary relations between simple natures. Enumeration is a process of review which we use when deductions become so long that we risk error due to a faulty memory. Descartes realized that he needed a provisional set of moral guidelines to carry him through the transition. He presents four such rules: (1) obey the laws of his country and adhere to his faith in God, (2) to be consistent in following positions, even if they seem doubtful, (3) change his desires rather than the order of the world, (4) to choose the best occupation he could (i.e., that of a philosopher). Accordingly, vowing to live as a spectator rather than an actor, he traveled for a year, then lived in Holland for eight years where he had no relatives and was free from political turmoil. Descartes continues discussing metaphysical issues which he developed more fully in the *Meditations*. Although Descartes' method had its advocates, it was also criticized by his contemporaries, such as the mathematician Pierre de Fermat, and ultimately dismissed. Leibniz says that Descartes' rules amount to saying "take what you need, and do what you should, and you will get what you want."

THE MEDITATIONS.

Descartes' most famous and influential philosophical writing is his *Meditations*. The full title of the work is *Meditations on the First Philosophy: In Which the Existence of God and the Distinction Between Mind and Body are Demonstrated.* The work was first published in 1641 in Latin and as

was translated into French in the following year by the Duc de Luynes. Descartes was so pleased with the French translation that he made some additions and endorsed it for later publication. Descartes passed a manuscript of his *Meditations* onto his friend, Father Mersenne, who solicited comments from fellow scholars, including Thomas Hobbes. The comments were returned to Descartes. These, along with his lengthy replies -- several times longer than the *Meditations* themselves -- were included in the second published edition of the *Meditations* (1642).

DEDICATION. Descartes dedicates the *Meditations* to the faculty of the Sorbonne, which was the divinity school of the University of Paris. For centuries, the Sorbonne was center of Catholic theology. By dedicating his work to the Sorbonne faculty, Descartes' was announcing that his philosophy was consistent with traditional Catholic theology. Descartes was a devout Catholic and had no desire to offend the Church. Nevertheless, he believed that Aristotelianism had no place in the new scientific age. Cautioned by the fate of Galileo, Descartes proposed his new theories diplomatically. In his Principles of Philosophy, for example, he cautiously suggests a theory of the solar system similar to Galileo's. he expresses his hope that his theory could "be used in Christian teaching without contradicting the text of Aristotle." Descartes announces at the opening that there are two driving issues behind the *Meditations*: proving the existence of God and the immortality of the soul through natural reason. One would expect divinity school faculty to approve of this plan. However, it is not entirely that these issues are his chief concern in the *Meditations*. Descartes discusses the importance that the Sorbonne faculty themselves place on rational proofs. Descartes continues by noting how skeptics view the immortality of the soul and the Catholic church's official reaction to such skepticism. Descartes stresses the importance of rationally demonstrating the existence of God and the immortality of the soul. He also notes that he intends to follow the method of investigation proposed in his Discourse on the Method. According to Descartes, geometricians rarely show the falsehood of accepted truths and demonstrations. By contrast, philosophers typically show the falsehood of contentions without venturing to explore truth. Descartes closes the dedication pleading with the faculty of the Sorbonne that their support and influence is necessary for the *Meditations* to be seen as a successful refutation of skepticism.

MEDITATION 1. Descartes opens his *Meditations* indicating his desire to have only true beliefs. One way to accomplish this is to doubt everything he has learned that might be suspect of error. He does not intend to doubt the truth of every specific idea that comes into his head, but, instead to undermine the foundations of his views. The main assumption he brings under suspicion is the reliability of sensory information. Descartes proposes to systematically follow a process of doubt. The doubt is not a simply common sense one, though, as when I doubt whether black cats are harbingers of bad luck. Instead, his doubting process is philosophical one, and sometimes called "hyperbolic" (or exaggerated) doubt where he proposes to doubt anything which has some reason to doubt. The goal of this doubting process is to arrive at a list of beliefs which are certain and indubitably true. It thus may be viewed as a systematic doubting experiment. The experiment consists of articulating several reasons by which sensory information can be brought into question. When he presents the last of these reasons, there are virtually no items of knowledge he can have confidence in.

Much of Descartes argumentation rests on a distinction which, later in the history of philosophy, became known as that between primary and secondary qualities. Briefly, we look at an apple and perceive qualities of redness, sweet smell, roundness, and singularity. Descartes recognized that the qualities of redness and sweet smell do not really belong to the apple. Instead these qualities exist only in the mind of an observer, and are then imposed onto the apple. These have been

traditionally called secondary qualities. By contrast, the qualities of roundness and singularity belong to the apple itself, and are not products of the observer's mind. These have been termed primary qualities. For Descartes, secondary qualities arise from what he calls "objects of the senses," and primary qualities from "objects of mathematics." The following illustrates the connection:

```
               |    Objects   Qualities
_____________________________________________________________
     Secondary |    objects        hardness, heat,
               |    of        light, odor, color,
               |    senses         taste, sound
               |
     Primary        |    objects        quantity, shape
               |    of        time, magnitude,
               |    mathematics
```

An apple would be a secondary object, or object of the senses, when we consider only its secondary qualities of redness and sweet smell. On the other hand an apple is a primary object, or object of mathematics, when we consider only its primary qualities of shape and singularity (quantity). The root of the primary/secondary distinction is the attribute of extension (or existence in space). All primary qualities are features which necessarily belong to extended objects. All secondary qualities, by contrast, do not necessarily belong to extended objects and, thus, are spectator dependent. In view of this primary/secondary distinction, when Descartes doubts the reliability of his senses, he must find reason to doubt both his primary and secondary perceptions.

Descartes begins his systematic doubting experiment by pointing out an obvious credibility problem with our senses: optical illusions. Descartes begins doubting the reliability of his senses by noting that we perceive distant objects to be much smaller than they really are. This, though, is somewhat trivial, and does not undermine the general reliability of the senses. Continuing his doubting experiment, Descartes suggests the possibility that he his dreaming. This, though, only brings into question the existence of objects of the senses (i.e., secondary qualities), and does not affect objects of mathematics (i.e., primary qualities). Taking his doubts further, Descartes initially speculates that God is deceiving him about all of the things which he believes or perceives, including primary objects (even mathematics). Suggesting that God is a deceiver, though causes

him problems, though, because according to traditional Christian theology, infinite goodness is one of God's necessary attributes. If backed into a corner, some might deny God's existence rather than admit that he is the cause of deception. With God out of the picture, though, Descartes argues that he would be even more vulnerable to deception. This takes him into a discussion of skepticism, and he reflects on how far astray his doubts may take him, and to what extent they are justified. Discussions of skepticism during the modern period often drew a distinction between speculative and actional skepticism. A speculative skeptic merely uncovers theoretical problems, and an actional skeptic continues by recommending a course of action. With religious beliefs in particular, actional skepticism was viewed as more dangerous as it might recommend that act as though there were no God. However, Descartes only proposes theoretical doubt. In any event, he revises his doubt so not to run counter to traditional Christian belief and, accordingly, proposes that an evil genius (and not God) deceives him.

MEDITATION 2. Descartes opens Meditation Two by describing the extent of his doubt. Virtually every item of knowledge he previously believed is subject to some kind of doubt for reasons given in the previous meditation. The ancient Greek engineer Archimedes said "give me a fulcrum and a firm point, and I alone can move the earth." Analogously, Descartes believes that if he finds on indubitable truth, then this will be the foundation of a true philosophical system. That point is his existence: "I am, I exist, is necessarily true each time that I pronounce it, or that I mentally conceive it." Even an evil genius cannot deceive him in this matter. In his *Discourse on the Method*, Descartes summarizes his line of reasoning in the famous phrase, "I think, therefore I am" (or in Latin, "cogito ergo sum"). Descartes borrowed this strategy from Augustine's attempt to refute skepticism in his own day. Augustine writes, "On none of these points do I fear the arguments of the skeptics of the Academy who say: what if you are deceived? For if I am deceived, I am. For he who does not exist cannot be deceived. And if I am deceived, by this same token I am" (City of God, 11:26). Critics of Descartes question exactly what kind of inference Descartes is making in his contention that "I think *therefore* I am." Descartes himself helps clarify this in his reply to the "Second Set of Objections" to his *Meditations*. In these Objections, the critic contends that all demonstrative knowledge depends on God, which isn't proven until Meditation three; but, Descartes deduces his existence in Meditation two. Descartes replies that the cogito is not deduced, but is recognized by a simple act of mental vision.

Once Descartes recognizes the indubitable truth that he exists, he then attempts to further his knowledge by discovering the type of thing he is. Trying to understand what he is, Descartes recalls Aristotle's definition of a human as a rational animal. This is unsatisfactory since this requires investigating into the notions of "rational" and "animal." Continuing his quest for identity, he recalls a more general view he previously had of his identity, which is that he is composed of both body and soul. He can't refer to himself as a thing which has a body, though, since this involves sensory perception. According to classical philosophers such as Plato and Aristotle, the key attributes of the soul involve eating, movement, and sensation. He can't claim to have these attributes of the soul since this involves a body which, knowledge of which, in turn, is based on the senses. Descartes continues examining other theories of human existence and attributes about himself which he can imagine. Descartes concludes that the attribute of thinking is the only quality which he can justifiably claim at this point. But he is quick to point out that thinking is the only attribute about which he is sure -- not that thinking is the only attribute which he has. Nevertheless, this is the starting point of a radical ontological distinction which carries Descartes through his *Meditations*. That distinction is between thinking substance (res cogitans) and extended

substance (res extensa). The two substances are mutually exclusive. A thinking substance is nonphysical or spiritual in nature, and an extended substance is physical, but not capable of consciousness or thought. For Descartes, a thinking thing is "a thing which doubts, understands, [conceives], affirms, denies, wills, refuses, which also imagines and feels."

Note Descartes' general strategy for adding to his knowledge. He is first concerned with the issue of personal identity, and will only much later address the issue of external objects (in Meditation Six). He then anticipates the criticism that he is going about his investigation backwards. For, it seems that knowledge of external objects is more obvious and distinct than knowledge of personal identity. Everyone knows what an apple is (an external object), but few people can properly answer the question "who am I" (an issue of personal identity). Thus, it seems that Descartes should tackle the easier problem of external objects first. Descartes does not agree that he proceeding in a backwards fashion, and argues that our personal identity is actually more clear and fundamental than perception of external objects. He makes his case by comparing our perceptions of a piece of wax at two times: once while the wax is in a solid state, and later after the wax has been melted by a fire. In arguing that knowledge of the mental realm precedes knowledge of the material realm, Descartes argues that our senses alone cannot inform us of the continuity of the two states of the wax since none of the qualities remains the same. The continuity of the wax cannot be established though the faculty of the imagination either, since we could imagine an infinite variety of changes the wax could go through. Descartes concludes that the continuity of the wax is established neither by sight, nor touch, nor imagination, but by an act of the mind alone. He considers possible criticisms to his conclusion that we understand the physical world through an act of the mind. In common language we claim that we "see" the same wax in its two states (as opposed to "mentally intuit" the same wax in its two states). Thus, common language seems to suggest that the continuity of the wax is a function of "seeing" (i.e., the senses). When I look out the window, I conclude that we see people crossing the road. All that appears to my senses, though, is clothing. He considers again whether we understand the physical world through the senses and imagination together. Even if Descartes is wrong and we understand the wax through our senses or our imagination, he argues that mental events are still prior to sensations. For, even if he erroneously judges that the wax exists through sight or imagination, this presupposes that he himself exists.

In the Dedication, Descartes argues that one of the two main objectives of the *Meditations* is to prove the immortality of the soul. Interestingly, Descartes scarcely addresses this issue in the *Meditations*. His most complete discussion of the subject appears here in the Synopsis to Meditation Two. He begins his discussion by describing when the issue of immortality should be addressed in the order of his investigation. One factor in establishing the immortality of the soul is showing that the soul is composed of an indestructible and unalterable substance. Although the material substance of the human body is in general indestructible, the composition of the body is alterable. Thus, it is not eternal. The spiritual substance of the human mind in general is also indestructible. Our minds also change when we have different perceptions. Using Aristotle's terminology, these changes are accidental, though, and not essential.

MEDITATION 3. Descartes notes that when he contemplates on the certainty of his existence, he knows the truth of his existence clearly and distinctly. He proposes a general rule: everything he perceives clearly and distinctly is true. Descartes would like to use this general rule and show both the existence of external objects and the truth of mathematics. For, to differing degrees, both of these are vivid concepts. Unfortunately, knowledge of external objects does not rise to the level of

clarity and distinctness. Sensory judgments about the external world at first seemed vivid, but later proved to be questionable. By contrast, mathematical judgments are perceived clearly and distinctly. However, an obstacle remain: God may be deceiving him irrespective of how clearly and distinctly he perceives mathematical truths. To put the general rule of clarity and distinctness on sound footing, Descartes must (a) prove God's existence, and then (b) show that God is not a deceiver.

In constructing his argument for God's existence, Descartes makes several prefatory comments about the nature and content of human thought. He begins outlining the various types of thoughts we have, which include ideas, thoughts, volitions and judgments. Only judgments have a truth value, and most deception comes from judgments about ideas. There are three kinds of ideas: fictitious (invented), adventitious (from external objects), and innate (inborn). A final prefatory issue concerns the adventitious ideas (that is, ideas of external objects). Are they really produced by external objects as they seem to be? One reason why we believe adventitious ideas have their origin in physical objects (as opposed to being mere fictions of the mind) is because we are taught this by nature. Descartes believes that nature teaches us in an unabsolute sense (that is, by a spontaneous impulse) that adventitious ideas are caused by external objects. We trust natural impulses, though, since they often lead us astray, such as with moral intuitions. Another reason why we believe adventitious ideas have their origin in external objects is that these ideas are independent of our will or volitions. We may not rely on this reason, though, since we may have an unknown mental faculty which produces such ideas against our will. Descartes next argues that even if adventitious ideas were caused by external objects, an idea may in no way resemble the object causing it. How does he illustrate this problem with our two ideas of the sun? Descartes concludes that only a "blind impulse" makes us believe that adventitious ideas correspond to real physical objects.

Since adventitious ideas have no clear basis in external objects, then Descartes cannot attempt to prove God's existence through a posteriori arguments (that is, arguments based on our perception of external objects). For example, he cannot argue for God's existence based on apparent design in the world, since he cannot trust his adventitious ideas of design. However, there is another path open to him. He may simply examine the content of his ideas, ignoring their connection with external objects. In his words, he will consider his ideas as merely "modes of thought." When we view ideas merely as modes of thought, some seem more perfect or complex than others. In Descartes' terminology, a more perfect or complex idea has greater objective reality than a less perfect or complex idea. For example, ideas of eternal substance, such as God, have more perfection than ideas of finite substance, such as trees or dogs.

Descartes next discusses a principle of causality: "there must be as much in the total efficient cause as there is in the effect of that same cause." That is, there must be as much in any cause as there is in its effect. For example, if an object has 5 units of heat, then its cause must have at least 5 units of heat. This principle has been traditionally called the principle of sufficient reason, and he believes that we know this innately. Descartes argues that the principle of sufficient reason applies to ideas as well as to physical objects. That is, an idea with a moderate amount of objective reality (let's say, with five units of complexity) must be produced by something with at least that much objective reality (five or more units of complexity). Based on the principle of sufficient reason as it applies to ideas, Descartes believes that there are important conclusions we can draw about the origin of specific ideas. Descartes believe that his ideas of people, animals or angels could have arisen from within himself since they can arise from ideas of himself. He continues discussing the origins of

ideas of physical objects, particularly regarding their secondary and primary qualities. He believes that his ideas of light, colors, sounds, odors, tastes, and heat (that is, secondary qualities) need no explanation outside of himself. Primary qualities too, such as substance, duration, and number, may also be explained by the idea of himself.

Finally, Descartes considers the idea of God which is in his mind. This idea is that of "an infinite and independent substance." More to the point, he has in his mind an idea of infinite perfection. This requires an explanation beyond himself, and that explanation must have as much objective reality as the initial idea of infinite perfection. This, then, is his proof for God's existence:

1. We have an idea of infinite perfection.
2. The idea we have of ourselves entails finitude and imperfection.
3. There must be as much reality in the cause of any idea as in the idea itself (the principle of sufficient reason).
4. Therefore, the idea we have of infinite perfection originated from a being with infinite perfection, and this being is God.

Once proving God's existence, Descartes addresses three possible criticisms of his argument. Each of these possible criticisms suggests that our idea of infinite perfection need not be caused by God himself. A first possible criticism is based on Descartes assumption that we initially possess an idea of the infinite, and that our idea of the finite consists of the negation of our idea of the infinite. A critic might argue that the opposite is the case: we have an initial idea of the finite and our idea of the infinite is its negation. In this case, we could be the cause of infinite perfection by (a) taking the idea of finite imperfection from ourselves, and (b) negating this idea. Thus, for Descartes' proof to be successful, he needs to show that we initially possess an idea of the infinite. And, Descartes contends that we initially possess the idea of the infinite. A second possible criticism is that the idea of infinite perfection is "materially false and can therefore be from nothing." More simply, the suggestion is that the idea of infinite perfection is an incoherent concept, and needs no explanation beyond itself. However, Descartes argues that the notion of infinite perfection is clear and distinct in the highest degree, and thus requires an explanation. A third possible criticism is that perhaps we are potentially infinitely perfect, and thus produced the idea of infinite perfection from our hidden potential. Descartes gives three replies to this third criticism. First, if his potential perfection can be actualized only gradually (through a gradual increase in knowledge), this implies that he is finite. And, if he is a finite being, he could not produce the idea of infinite perfection. Second, he argues that even if his knowledge would increase gradually over an infinite amount of time, at no point would he have infinite knowledge. Third, he argues that the objective being of an idea cannot be produced by a merely potential being.

Since Descartes has proven his own existence and the existence of God, he now finds it appropriate to show that God was the cause of his existence. He shows this through the process of elimination, arguing that he could not be produced by (a) himself, (b) a finite cause less perfect than God, (c) by several partial causes, or (d) by his parents. God is the only possible cause for his existence. Descartes gives two replies to the suggestion that he was derived from himself. His first reply is that if he caused himself, then he would be God since he would give himself every perfection he could. Descartes' second reply is based on the fact that he exists over time. Each of the parts and moments of his existence depends on others. He then asks whether "I have some power through which I can bring it about that I myself, who now am, will also exist a little later?" He answers that he does not have the power in himself for duration, so he doesn't have the power for creation

either. Another suggestion is that he was caused by a finite cause less perfect than God. He responds noting that this finite cause would have to possess the idea of infinite perfection too, hence we need to inquire into its cause as well. Another suggestion is that he was created by several partial causes. This fails, though, since the concept of infinite perfection is unified, so the cause of it must be unified. Finally, he addresses the suggestion that he was caused by his parents. Although his parents may be the cause of his body, they are not the cause of his thinking existence insofar as he has an idea of infinite perfection. Descartes concludes that God must be the cause of him, and that God innately implanted the idea of infinite perfection in him.

Descartes closes Meditation Three arguing that as God's creation, it is highly believable that God made him in his image, and that he understands God reflectively, just as he understands himself. He concludes that God is not a deceiver since deception is an imperfection, and God is infinite perfection.

MEDITATION 4. At the close of the Third Meditation, Descartes has arrived at all of the fundamental principles he needs in his quest for truth: (1) he exists (a foundational fact which is indubitable), (2) God exists and is not a deceiver, and (3) clarity and distinctness are reliable indicators of truth. Descartes' goal is to show that we can rely on our senses to at least some degree. Meditations IV and V do not contribute directly to this goal. Meditation IV explains the source of human error and argues that God is not responsible for our mistakes. Descartes' concept of "error" is broad, referring to any mistaken judgment whatever. This includes assertions, predictions, ethical judgments, or judgments leading to an action. Descartes begins his quest for the origin of error by considering several theories which he ultimately rejects. He first considers whether God could be the cause of his error. He quickly rejects this, though, since God is not a deceiver. He next considers the possibility that human error results from his faculty of judgment. This makes sense since he sees himself as finite, existing on a middle rung of the great chain of being between God and nothing. Thus, error would seem to be a defect which we can blame on our faculty of judgment. However, it unsatisfactory to say that human error results from his faculty of judgment since a perfect God would not would not place an imperfect faculty in him. Descartes is puzzled that God could have made him such that he would never err, yet he clearly does err, and he suggests that maybe he can never know God's purpose in allowing us to err, since the wisdom of God is above human intellect. However, he concludes that we should examine God's in creation as a whole, not just his purpose in creating me personally in a manner that involves error.

After rejecting the above suggestions, Descartes considers the specific faculties involved when we make mistakes: the understanding and the will. He can find no reason to hold either of these faculties individually responsible for error. Our reason cannot be faulted since although knowledge is limited, the intellectual faculty of judgment itself has no error. The faculty of the will itself does not produce error since the will is a perfect faculty, and, indeed, is as perfect as God's (God's is only greater in terms of power, knowledge, and affected objects). He briefly discusses the free nature of our will. Even when strong motives incline us toward one direction, we choose all the more freely in that direction. Freedom is at its lowest when no motive moves me more in one direction than in another

Descartes considers a final view that error results when we extend our will beyond our knowledge. This, he believes, is the true explanation. According to Descartes, our will often becomes indifferent (or lazy) and accidentally extends beyond the bounds of our knowledge. He stresses that we should abstain from willing when we have insufficient knowledge. As an example, he explains that at this stage in his investigation he doesn't know whether his essential qualities include mind, body, or

both. Hence, he abstains from any willful judgment on this issue. In this and similar cases, he believes that proper use of freedom requires us to abstain from willful judgment. Suppose, though, that, by chance, we stumble upon some truth beyond the scope of our knowledge. For Descartes, it is still improper to use the will in this manner since I know clearly and distinctly that full knowledge ought to precede volition.

Descartes next argues that even though God created us, God is not responsible for errors that we make. He considers several possible criticisms against God's role. One might first criticize God for giving us limited knowledge. However, finitude is my essence, and this involves limited knowledge (God was not required to make me infinite). Second, one might criticize God for allowing us to extend our will beyond our knowledge. In reply, Descartes argues that God merely allows us to make erroneous willful judgments, but does not cause us to make them. Third, one might also criticize God for not more actively preventing me from erring. For example, God could have given me clear and distinct perception of everything I would ever need to know. Alternatively, God could have impressed more firmly on my memory the importance of not extending my will beyond my knowledge. However, although this would make me more perfect, when I view the goodness of the whole universe, God may have some need for me to be a less perfect being. Descartes argues that we don't need God to impress more firmly on our memories the importance of restraining the will. By developing the right habits, we can do this ourselves. Through practice, I can develop such habits when I remember previous circumstances in which I over-extended my will

MEDITATION 5. In the Fifth Meditation, Descartes presents another argument for God's existence. Like the argument in Meditation III, Descartes' argument here does not appeal to sensory information (such as natural design). Instead, it is based on the content of his thoughts. The proof in this Meditation follows Anselm's ontological argument. He begins Meditation Five noting that he can imagine an array of two and three dimensional shapes. Some of these, like triangles, portray such clear and distinct attributes which necessarily belong to them. Since from the mere idea of a triangle one can deduce necessary attributes of a triangle, in the same way, from the mere idea of God (that is, a supremely perfect being) we can arrive at necessary attributes that belong to him. Put more precisely, Descartes' proof of God is this:

1. **I have an idea of a supremely perfect being**
2. **The idea of this being necessarily entails every perfection**
3. **Existence is a perfection**
4. **Therefore, the idea of a supremely perfect being entails existence (that is, a supremely perfect being exists)**

Descartes next anticipates three possible objections to his argument. A first objection to Descartes' proof is God can be thought of as not existing. That is, we can separate his existence from his essential attributes. Since, according to the critic, we can conceive of God as not existing, then existence is not a necessary attribute of this idea. Descartes replies that we cannot separate God's existence from his essential attributes when we carefully consider this idea. A second objection to Descartes' proof is that even though a necessary attribute of a mountain is that it be adjacent to a valley, it doesn't follow that any mountains or valleys exist. In the same way, even though the concept of supremely perfect being necessarily possesses certain attributes, it doesn't follow that this being exists. Descartes replies that this misses the analogy; existence is essential to God, just as having wings is essential to a winged horse.

A third criticism of Descartes' proof is that if we don't bother considering the idea of a supremely

perfect being, then we won't be forced into asserting that existence is one of his perfections. Descartes replies that as often as we consider the idea, we need to give it existence. Descartes argues that not only does the idea of God necessarily include existence, but the initial idea of God itself is innate. Unlike elaborate proofs in geometry, Descartes argues that it is quite easy to understand that existence is a necessary attribute of a supremely perfect being.

Descartes argues that absolute knowledge of anything, including geometry, depends on a prior knowledge of God. Suppose we are analyzing an elaborate geometrical proof. While all of the ideas are fresh in our minds, we can see that the proof is sound. However, as time passes, the details of the proof are no longer in our minds, and we might then doubt the soundness of our proof. But, even if we forget the details of a proof, we can still rely on our established conclusion insofar as each step was perceived clearly and distinctly. Since God is not a deceiver, then we can trust that all we perceive clearly and distinctly is necessarily true. Hence, the certainty and truth of every science depends on knowledge of the true God

MEDITATION 6. At this point in the *Meditations*, Descartes has obtained certainty about a variety of topics: his existence, his essence, the causal principle, God's existence, that God made him, that God is not a deceiver, that clarity and distinctness are indicators of truth, that he has a free will, the source of error, and that God is the source of confidence in elaborate proofs. Descartes sets two aims in Meditation VI: first, to show the existence of material objects, and, second, to show that mind is distinct from body.

Recalling the distinction made earlier between primary objects of perception (objects of mathematics) and secondary objects of perception (objects of the senses), Descartes investigates whether material objects exist by asking two questions: (1) do primary objects exist? and (2) do secondary objects exist? In answering the first question, Descartes draws on a distinction between imagining primary objects and conceiving of primary objects. He notes that he conceives of primary objects (such as triangles) clearly and distinctly, but this in no way means that such objects actually exist. It only means that they might exist since the idea contains no contradiction. In addition to conceiving of primary objects, though, Descartes says that he can imagine many primary objects as well. Descartes continues by illustrating the difference between conception and imagination. We can, for example, intellectually conceive of a chiliagon (a thousand sided figure) although we cannot imagine one (i.e., visually picture one in our minds). There is another distinction between conception and imagination: conception is a necessary attribute of humans, and imagination is not. Since we can conceive of primary objects, then such objects *possibly* exist. Since we can also imagine these objects, then such objects probably exist, yet we cannot say for sure whether they do exist.

Failing to attain certainty about the existence of primary material objects, Descartes turns his attention to secondary material objects. Since his notion of secondary objects rests on his faculty of secondary perception (which still might only be an illusion) he needs to explore this faculty. He does this by giving a summary of the first three Meditations, noting what conclusions he has already arrived at about secondary perception. He recalls first that he had a naive confidence in his senses (secondary perception) by which he perceived the different parts of his body, different emotional and physiological appetites, and various secondary qualities in objects such as heat and color. He next recalls how he gradually lost all confidence in the reliability of these secondary perceptions. There were three steps to this doubting process. First, we are misguided by optical illusions. Second, our perceptions may be dream states, and, third, God might be deceiving us. He recalls that external sensations seem to arise from a source outside of himself, since such sensations

don't depend on his will. However, he might have a faculty which is the source of external sensations and not know it. Descartes recalls how he attained certainty that God would not deceive him about his clear and distinct ideas. One such idea concerns the identity as a thinking thing. Even though he may have a body, his true identity is that of a thinking thing alone and, indeed, his mind could exist without his body. This is because (a) he see clearly and distinctly that he is a thinking unextended thing, and (b) he has a distinct idea of his body as an extended unthinking thing. He argues that humans are spirits which occupy a mechanical body, and that the essential attributes of humans are exclusively attributes of the spirit (such as thinking, willing and conceiving) which do not involve the body at all. Attributes, such as sense perception, movement, and appetite require a body, are attributes of our body and not of our spirit and, hence, do not comprise our essence.

Descartes continues explaining that we are designed with several mental faculties which are responsible for various ways of thinking. He is most concerned here with the passive faculty of perception, that is, a the ability of receiving and recognizing the ideas of sensible things. This implies that there is an active source of these ideas, either inside or outside of him. That is, if I passively (or non-willfully) perceive a rock in front of me, then there is some active source feeding me that perception. Descartes sees only three possible explanations of that active source: the perceptions are actively produced by either himself, God, or external objects. He eliminates the first two options and concludes that external objects are the active source of such perceptions.

1. **I know clearly and distinctly that there is in me a passive faculty which receives perceptions from an active source**
2. **This active source of perception is either me, God, or external objects**
3. **I am not that active source since such perceptions are not willfully produced and does not involve thinking (my true essence)**
4. **God does not implants ideas of perception in me since this would be deception**
5. **Therefore, external objects are the active source of perceptions**

For Descartes, (d) above is the crucial premise to his argument. Why does he believe that perceptions are not implanted in him by God? The answer is that, first, Descartes has no faculty by which he could know if such perceptions are implanted by God. Second, he has a strong inclination to believe that secondary perceptions are the result of secondary external objects. Third, Descartes argues that it would be deception on God's part if God (a) permitted Descartes to erroneously believe perceptions are caused by objects and (b) did not give him a faculty to know that such notions are actually caused by God. Descartes has here expanded on the notion of God not being a deceiver. In Meditation Three, God's quality of non-deception was commissive in that a perfect God could not commit any act which would deceive. Here, however, Descartes argues that a perfect God cannot omit any preventative measures which would help Descartes understand the truth. God's non-deception, then, is also omissive. This commissive/omissive distinction is similar to the notion of sins of commission (such as the direct stabbing of an innocent person) and sins of omission (such as refusing to rescue a person from drowning). Descartes maintains, then, that a non-deceptive God can perform neither deceptions of commission, nor deceptions of omission.

Even though Descartes is confident that such perceptions result from external objects, he still has reservations about the reliability of this sense perception. Descartes addresses the issue by looking at the somewhat ambiguous manner in which nature teaches him about external objects. In the most general sense, natural teachings are any dispositions implanted in us by God. In its more

particular sense, natural teachings are the complexus of all things which God has given me. He explains that some things nature teaches us are true and important. The three important truths which nature teaches us are (1) I have a body i need of food, (2) mind and body are connected, and (3) there are external bodies or objects. These truths of nature all hinge on the fact that we are composed of both a mind and body. Descartes continues that although some things nature teaches are true, other natural teachings may be false. Four such things are (1) unperceived space is a vacuum, (2) the idea of heat resembles some external state of affairs, (3) perceived colors resemble external colors, and (4) bitter tastes resemble external things.

Descartes now has a problem: some things nature teaches us are true, yet some things nature teaches us may be false. His solution is to distinguish between the various ways that nature can teach us something. As noted, all natural teachings are dispositions given to us by God. One subset of natural teachings pertain only to the mind, and these are clear and distinct. The subject matter of such teachings involves purely mental concepts, such as "what is done cannot be undone." When nature teaches us in this manner, there is no question about the truth of the matter. A second subset of natural teachings pertain only to the body. Descartes does not deal with these. Yet a third subset pertains to the relation between our minds and bodies. These truths are a little more obscure and can be misinterpreted. All of the natural teachings noted above are of this mind/body type. The false ones, then, are simply misinterpretations. He examines more carefully the above apparent natural teachings which are false, and explains what is really going on. For example, with pain which is caused from heat, it is true that something in heat excites pain, but I can't say that something resembling pain resides in heat. He believes that the ultimate source of error here is that we have conflicting signals about what we should pursue or avoid.

Descartes anticipates a criticism which compares a sick person who improperly perceives things to a poorly designed clock which gives the wrong time. God, thus, would be at fault for poorly designing humans. He dismisses this line of reasoning, though, since it imposes an artificial order on the body by forcing a comparison with clocks. Descartes argues that there are four sources of error which are inherently tied to the structure of our physical bodies. The first of these stems from the fact that the mind and body are distinct, in particular, the mind is unified and the body is divisible The second results from the fact that the mind does not receive impressions directly from all parts of the body. The third arises from the fact that there are long nerves going to and from the brain. If we poke one of these at any place, we will have the same sensation. Finally, some bodily feelings are deceptive insofar as they give us exaggerated or misdirected sensations. These, though, are present for the benefit of self-preservation. From these four reasons, Descartes concludes that the construction of our bodies subject us to error. However, he believes that we can counteract this problem and ultimately have confidence in our bodily perceptions. First, Descartes notes that bodily errors are not haphazard, but have a kind of mechanical logic. He concedes that our bodies often mislead us when we are sick. However, this is better than the alternative possibility that we think we are well when we are infact sick. Insofar as our memory has us connect the present to the past, we can counter the misleading effects of bodily perceptions and can ultimately rely on his senses.

Descartes further restores confidence in bodily perceptions by setting aside the possibility that he is dreaming. When we are awake, our memories unite the events of our lives; when we are dreaming, memory cannot connect our dreams together.

PREFACE TO THE READER. Descartes opened the *Meditations* with a Preface. However, since the content of the preface depends on arguments in the *Meditations* proper, it will be discussed

here. In his earlier Discourse on the Method (1637), Descartes also discusses the existence of God and the nature of the human soul. He explains that the earlier discussion in the Discourse was intentionally brief. The Discourse was published in French, as opposed to Latin, and thus available to common readers. Accordignly, he toned down the arguments to keep "feeble minded" people from following its course. The *Meditations*, by contrast, were written in Latin and not intended for the casual reader.

In the Discourse, Descartes requested that his readers point out errors in his reasoning. He presents and responds to two of the more important criticisms made. Although the objections are aimed at the Discourse, they can also be related to the line of reasoning in the *Meditations*. In Meditation Two, Descartes notes that thinking is the only quality which he can claim to possess. In Meditation Six, he states more strongly that thinking is the only quality which the soul possesses. The former is an epistemological claim, and the latter is an ontological claim. Descartes' critics point out that the second claim cannot be inferred from the first. Descartes believes that in the *Meditations* he is sufficiently justified in concluding that the essence of the soul is thinking (an ontological claim) given that thinking is the only attribute which he knows he has (an epistemological claim). However, he claims that his intention in the Discourse was to merely make the epistemological claim. The second objection again applies to the reasoning in the Discourse, but can also be related to the *Meditations*. In Meditation Three Descartes proves God's existence based on the fact that he has an idea of infinite perfection in his mind. The critic contends that he can't have an infinitely complex idea since it must be limited by our own finitude. In response, Descartes argues that there are two sense of "idea". The first is an act of my understanding; this, he concedes, is finite. However, the second is the thinking which is represented by the act of my understanding; this, though, can be infinite.

OTHER ASPECTS OF DESCARTES' PHILOSOPHY

THE PINEAL GLAND. As seen in Meditation Six, Descartes believes that humans are composed of two distinct parts: a physical body which moves about in the physical world, and a nonphysical or spiritual mind which does the thinking. This dualism presents a problem for Descartes insofar as an explanation is needed as to how our minds and bodies interact in their separate realms. For example, when my hand touches something hot, this sensation is registered in my mind. Also, if my mind decides to remove my hand, this decision must be transferred to my body, which results in motor activity. Thus, Descartes needs an explanation of both sensory and motor communication between our spirit minds and physical bodies. He offers such an explaination in Part One of *The Passions of the Soul* (1649): the pineal gland in the brain is the gateway between the two realms. He notes that there are two standard accounts of how the body and soul are connected: through the heart, and through the whole brain. He rejects these and suggests that the point of interaction is the pineal gland. This is because it is a single gland in the center of the brain, which unites our doubled sensory perceptions (e.g. two eyes). With sensory perception, information transferred to the pineal gland through animal spirits, blood, and nerves. With motor commands, the gland is moved by the soul, and thrusts the animal spirits towards the pores of the brain, and onto the nerves.

THE AUTOMATISM OF ANIMALS. Descartes believed that, on earth, only humans have a dual spirit/body nature. Non-human animals have only bodies and are essentially automaton or biological robots which behave according to their internal biological programs. Thus, they do not think, even though they behave in ways which we might mistakenly take to reflect conscious

thought. Descartes' view was patently rejected by many of his contemporaries. In his article on Rorarius in the Historical and Critical Dictionary (1692), Bayle presents a long list of criticisms against Descartes' theory. Even today Descartes' view is the object of ridicule by animal rights advocates. Descartes' reasoning is presented in a letter to Henry More. He argues that there are two sources of motion in organisms. The first is mechanical and bodily and involves the physiological mechanism of animal spirits. The second is mind or soul which is incorporeal. Descartes believes that the mental cause of motion does not apply to animals, and that all of their behavior can be explained by mechanical and bodily events. The common reason for holding that animals think is that they have sensory organs like humans. However, Descartes offers several reasons for not ascribing thinking to animals. First, we acknowledge that lower animals (such as bugs) move only by mechanics. Recognizing this makes it easier to see why this is so of higher animals as well. Second, our own human bodies move without thought, such as when we are in convulsions. Third, we can create machines which move. His main argument, though, is that animals have no true language. Interestingly, Descartes claims that he is not denying life or feeling to animals, but only thought:

> **It must, however, be observed that I speak of the thought of animals, not of their life, nor of their sensation. For I do not deny the life of any animal when making it consist solely in the warmth of the heart. I do not refuse to them feeling even, in so far as it depends only on the bodily organs. Thus, my opinion is not so cruel to animals as it is favorable to humans. I speak to those who are not committed to the extravagant position of Pythagoras, who held people under suspicion of a crime those who ate or killed animals**

John Dewey (1859-1952)

Life and Works

John Dewey was born on October 20, 1859, the third of four sons born to Archibald Sprague Dewey and Lucina Artemesia Rich of Burlington, Vermont. The eldest sibling died in infancy, but the three surviving brothers attended the public school and the University of Vermont in Burlington with John. While at the University of Vermont, Dewey was exposed to evolutionary theory through the teaching of G.H. Perkins and *Lessons in Elementary Physiology,* a text by T.H. Huxley, the famous English evolutionist. The theory of natural selection continued to have a life-long impact upon Dewey's thought, suggesting the barrenness of static models of nature, and the importance of focusing on the interaction between the human organism and its environment when considering questions of psychology and the theory of knowledge. The formal teaching in philosophy at the University of Vermont was confined for the most part to the school of Scottish realism, a school of thought that Dewey soon rejected, but his close contact both before and after graduation with his teacher of philosophy, H.A.P. Torrey, a learned scholar with broader philosophical interests and sympathies, was later accounted by Dewey himself as "decisive" to his philosophical development.

After graduation in 1879, Dewey taught high school for two years, during which the idea of pursuing a career in philosophy took hold. With this nascent ambition in mind, he sent a philosophical essay to W.T. Harris, then editor of the *Journal of Speculative Philosophy,* and the most prominent of the St. Louis Hegelians. Harris's acceptance of the essay gave Dewey the confirmation he needed of his promise as a philosopher. With this encouragement he traveled to Baltimore to enroll as a graduate student at Johns Hopkins University.

At Johns Hopkins Dewey came under the tutelage of two powerful and engaging intellects who were to have a lasting influence on him. George Sylvester Morris, a German-trained Hegelian philosopher, exposed Dewey to the organic model of nature characteristic of German idealism. G. Stanley Hall, one of the most prominent American experimental psychologists at the time, provided Dewey with an appreciation of the power of scientific methodology as applied to the human sciences. The confluence of these viewpoints propelled Dewey's early thought, and established the general tenor of his ideas throughout his philosophical career.

Upon obtaining his doctorate in 1884, Dewey accepted a teaching post at the University of Michigan, a post he was to hold for ten years, with the exception of a year at the University of Minnesota in 1888. While at Michigan Dewey wrote his first two books: *Psychology* (1887), and *Leibniz's New Essays Concerning the Human Understanding* (1888). Both works expressed Dewey's early committment to Hegelian idealism, while the *Psychology* explored the synthesis between this idealism and experimental science that Dewey was then attempting to effect. At Michigan Dewey

also met one of his important philosophical collaborators, James Hayden Tufts, with whom he would later author *Ethics* (1908; revised ed. 1932).

In 1894, Dewey followed Tufts to the recently founded University of Chicago. It was during his years at Chicago that Dewey's early idealism gave way to an empirically based theory of knowledge that was in concert with the then developing American school of thought known as pragmatism. This change in view finally coalesced into a series of four essays entitled collectively "Thought and its Subject-Matter," which was published along with a number of other essays by Dewey's colleagues and students at Chicago under the title *Studies in Logical Theory* (1903). Dewey also founded and directed a laboratory school at Chicago, where he was afforded an opportunity to apply directly his developing ideas on pedagogical method. This experience provided the material for his first major work on education, *The School and Society* (1899).

Disagreements with the administration over the status of the Laboratory School led to Dewey's resignation from his post at Chicago in 1904. His philosophical reputation now secured, he was quickly invited to join the Department of Philosophy at Columbia University. Dewey spent the rest of his professional life at Columbia. Now in New York, located in the midst of the Northeastern universities that housed many of the brightest minds of American philosophy, Dewey developed close contacts with many philosophers working from divergent points of view, an intellectually stimulating atmosphere which served to nurture and enrich his thought.

During his first decade at Columbia Dewey wrote a great number of articles in the theory of knowledge and metaphysics, many of which were published in two important books: *The Influence of Darwin on Philosophy and Other Essays in Contemporary Thought* (1910) and *Essays in Experimental Logic* (1916). His interest in educational theory also continued during these years, fostered by his work at Teachers College at Columbia. This led to the publication of *How We Think* (1910; revised ed. 1933), an application of his theory of knowledge to education, and *Democracy and Education* (1916) perhaps his most important work in the field.

During his years at Columbia Dewey's reputation grew not only as a leading philosopher and educational theorist, but also in the public mind as an important commentator on contemporary issues, the latter due to his frequent contributions to popular magazines such as *The New Republic* and *Nation* as well as his ongoing political involvement in a variety of causes, such as women's suffrage and the unionization of teachers. One outcome of this fame was numerous invitations to lecture in both academic and popular venues. Many of his most significant writings during these years were the result of such lectures, including *Reconstruction in Philosophy* (1920), *Human Nature and Conduct* (1922), *Experience and Nature* (1925), *The Public and its Problems* (1927), and *The Quest for Certainty* (1929).

Dewey's retirement from active teaching in 1930 did not curtail his activity either as a public figure or productive philosopher. Of special note in his public life was his participation in the Commission of Inquiry into the Charges Against Leon Trotsky at the Moscow Trial, which exposed Stalin's political machinations behind the Moscow trials of the mid-1930s, and his defense of fellow philosopher Bertrand Russell against an attempt by conservatives to remove him from his chair at the College of the City of New York in 1940. A primary focus of Dewey's philosophical pursuits during the 1930s was the preparation of a final formulation of his logical theory, published as *Logic: The Theory of Inquiry* in 1938. Dewey's other significant works during his retirement years include *Art as Experience* (1934), *A Common Faith* (1934), *Freedom and Culture* (1939), *Theory of Valuation* (1939), and *Knowing and the Known* (1949), the last coauthored with

Arthur F. Bentley. Dewey continued to work vigorously throughout his retirement until his death on June 2, 1952, at the age of ninety-two.

Theory of Knowledge

The central focus of Dewey's philosophical interests throughout his career was what has been traditionally called "epistemology," or the "theory of knowledge." It is indicative, however, of Dewey's critical stance toward past efforts in this area that he expressly rejected the term "epistemology," preferring the "theory of inquiry" or "experimental logic" as more representative of his own approach.

In Dewey's view, traditional epistemologies, whether rationalist or empiricist, had drawn too stark a distinction between thought, the domain of knowledge, and the world of fact to which thought purportedly referred: thought was believed to exist apart from the world, epistemically as the object of immediate awareness, ontologically as the unique aspect of the self. The committment of modern rationalism, stemming from Descartes, to a doctrine of innate ideas, ideas constituted from birth in the very nature of the mind itself, had effected this dichotomy; but the modern empiricists, beginning with Locke, had done the same just as markedly by their committment to an introspective methodology and a representational theory of ideas. The resulting view makes a mystery of the relevance of thought to the world: if thought constitutes a domain that stands apart from the world, how can its accuracy as an account of the world ever be established? For Dewey a new model, rejecting traditional presumptions, was wanting, a model that Dewey endeavored to develop and refine throughout his years of writing and reflection.

In his early writings on these issues, such as "Is Logic a Dualistic Science?" (1890) and "The Present Position of Logical Theory" (1891), Dewey offered a solution to epistemological issues mainly along the lines of his early acceptance of Hegelian idealism: the world of fact does not stand apart from thought, but is itself defined within thought as its objective manifestation. But during the succeeding decade Dewey gradually came to reject this solution as confused and inadequate.

A number of influences have bearing on Dewey's change of view. For one, Hegelian idealism was not conducive to accommodating the methodologies and results of experimental science which he accepted and admired. Dewey himself had attempted to effect such an accommodation between experimental psychology and idealism in his early *Psychology* (1887), but the publication of William James' *Principles of Psychology* (1891), written from a more thoroughgoing naturalistic stance, suggested the superfluity of idealist principles in the treatment of the subject.

Second, Darwin's theory of natural selection suggested in a more particular way the form which a naturalistic approach to the theory of knowledge should take. Darwin's theory had renounced supernatural explanations of the origins of species by accounting for the morphology of living organisms as a product of a natural, temporal process of the adaptation of lineages of organisms to their environments, environments which, Darwin understood, were significantly determined by the organisms that occupied them. The key to the naturalistic account of species was a consideration of the complex interrelationships between organisms and environments. In a similar way, Dewey came to believe that a productive, naturalistic approach to the theory of knowledge must begin with a consideration of the development of knowledge as an adaptive human response to

environing conditions aimed at an active restructuring of these conditions. Unlike traditional approaches in the theory of knowledge, which saw thought as a subjective primitive out of which knowledge was composed, Dewey's approach understood thought genetically, as the product of the interaction between organism and environment, and knowledge as having practical instrumentality in the guidance and control of that interaction. Thus Dewey adopted the term "instrumentalism" as a descriptive appellation for his new approach.

Dewey's first significant application of this new naturalistic understanding was offered in his seminal article "The Reflex Arc Concept in Psychology" (1896). In this article, Dewey argued that the dominant conception of the reflex arc in the psychology of his day, which was thought to begin with the passive stimulation of the organism, causing a conscious act of awareness eventuating in a response, was a carry-over of the old, and errant, mind-body dualism. Dewey argued for an alternative view: the organism interacts with the world through self-guided activity that coordinates and integrates sensory and motor responses. The implication for the theory of knowledge was clear: the world is not passively perceived and thereby known; active manipulation of the environment is involved integrally in the process of learning from the start.

Dewey first applied this interactive naturalism in an explicit manner to the theory of knowledge in his four introductory essays in *Studies in Logical Theory*. Dewey identified the view expressed in *Studies* with the school of pragmatism, crediting William James as its progenitor. James, for his part, in an article appearing in the *Psychological Bulletin*, proclaimed the work as the expression of a new school of thought, acknowledging its originality.

A detailed genetic analysis of the process of inquiry was Dewey's signal contribution to *Studies*. Dewey distinguished three phases of the process. It begins with the *problematic situation*, a situation where instinctive or habitual responses of the human organism to the environment are inadequate for the continuation of ongoing activity in pursuit of the fulfillment of needs and desires. Dewey stressed in *Studies* and subsequent writings that the uncertainty of the problematic situation is not inherently cognitive, but practical and existential. Cognitive elements enter into the process as a response to precognitive maladjustment.

The second phase of the process involves the isolation of the data or subject matter which defines the parameters within which the reconstruction of the initiating situation must be addressed. In the third, reflective phase of the process, the cognitive elements of inquiry (ideas, suppositions, theories, etc.) are entertained as hypothetical solutions to the originating impediment of the problematic situation, the implications of which are pursued in the abstract. The final test of the adequacy of these solutions comes with their employment in action. If a reconstruction of the antecedent situation conducive to fluid activity is achieved, then the solution no longer retains the character of the hypothetical that marks cognitive thought; rather, it becomes a part of the existential circumstances of human life.

The error of modern epistemologists, as Dewey saw it, was that they isolated the reflective stages of this process, and hypostatized the elements of those stages (sensations, ideas, etc.) into pre-existing constituents of a subjective mind in their search for an incorrigible foundation of knowledge. For Dewey, the hypostatization was as groundless as the search for incorrigibility was barren. Rejecting foundationalism, Dewey accepted the fallibilism that was characteristic of the school of pragmatism: the view that any proposition accepted as an item of knowledge has this status only provisionally, contingent upon its adequacy in providing a coherent understanding of the world as the basis for human action.

Dewey defended this general outline of the process of inquiry throughout his long career, insisting that it was the only proper way to understand the means by which we attain knowledge, whether it be the commonsense knowledge that guides the ordinary affairs of our lives, or the sophisticated knowledge arising from scientific inquiry. The latter is only distinguished from the former by the precision of its methods for controlling data, and the refinement of its hypotheses. In his writings in the theory of inquiry subsequent to *Studies,* Dewey endeavored to develop and deepen instrumentalism by considering a number of central issues of traditional epistemology from its perspective, and responding to some of the more trenchant criticisms of the view.

One traditional question that Dewey addressed in a series of essays between 1906 and 1909 was that of the meaning of truth. Dewey at that time considered the pragmatic theory of truth as central to the pragmatic school of thought, and vigorously defended its viability. Both Dewey and William James, in his book *Pragmatism* (1907), argued that the traditional correspondence theory of truth, according to which the true idea is one that agrees or corresponds to reality, only begs the question of what the "agreement" or "correspondence" of idea with reality is. Dewey and James maintained that an idea agrees with reality, and is therefore true, if and only if it is successfully employed in human action in pursuit of human goals and interests, that is, if it leads to the resolution of a problematic situation in Dewey's terms. The pragmatic theory of truth met with strong opposition among its critics, perhaps most notably from the British logician and philosopher Bertrand Russell. Dewey later began to suspect that the issues surrounding the conditions of truth, as well as knowledge, were hopelessly obscured by the accretion of traditional, and in his view misguided, meanings to the terms, resulting in confusing ambiguity. He later abandoned these terms in favor of "warranted assertiblity" to describe the distinctive property of ideas that results from successful inquiry.

One of the most important developments of his later writings in the theory of knowledge was the application of the principles of instrumentalism to the traditional conceptions and formal apparatus of logical theory. Dewey made significant headway in this endeavor in his lengthy introduction to *Essays in Experimental Logic*, but the project reached full fruition in *Logic: The Theory of Inquiry*.

The basis of Dewey's discussion in the *Logic* is the continuity of intelligent inquiry with the adaptive responses of prehuman organisms to their environments in circumstances that check efficient activity in the fulfillment of organic needs. What is distinctive about intelligent inquiry is that it is facilitated by the use of language, which allows, by its symbolic meanings and implicatory relationships, the hypothetical rehearsal of adaptive behaviors before their employment under actual, prevailing conditions for the purpose of resolving problematic situations. Logical form, the specialized subject matter of traditional logic, owes its genesis not to rational intuition, as had often been assumed by logicians, but due to its functional value in (1) managing factual evidence pertaining to the problematic situation that elicits inquiry, and (2) controlling the procedures involved in the conceptualized entertainment of hypothetical solutions. As Dewey puts it, "logical forms accrue to subject-matter when the latter is subjected to controlled inquiry."

From this new perspective, Dewey reconsiders many of the topics of traditional logic, such as the distinction between deductive and inductive inference, propositional form, and the nature of logical necessity. One important outcome of this work was a new theory of propositions. Traditional views in logic had held that the logical import of propositions is defined wholly by their syntactical form (e.g., "All As are Bs," "Some Bs are Cs"). In contrast, Dewey maintained that statements of identical propositional form can play significantly different functional roles in the process of

inquiry. Thus in keeping with his distinction between the factual and conceptual elements of inquiry, he replaced the accepted distinctions between universal, particular, and singular propositions based on syntactical meaning with a distinction between existential and ideational propositions, a distinction that largely cuts across traditional classifications. The same general approach is taken throughout the work: the aim is to offer functional analyses of logical principles and techniques that exhibit their operative utility in the process of inquiry as Dewey understood it.

The breadth of topics treated and the depth and continuity of the discussion of these topics mark the *Logic* as Dewey's decisive statement in logical theory. The recognition of the work's importance within the philosophical community of the time can be gauged by the fact that the *Journal of Philosophy*, the most prominent American journal in the field, dedicated an entire issue to a discussion of the work, including contributions by such philosophical luminaries as C. I. Lewis of Harvard University, and Ernest Nagel, Dewey's colleague at Columbia University. Although many of his critics did question, and continue to question, the assumptions of his approach, one that is certainly unique in the development of twentieth century logical theory, there is no doubt that the work was and continues to be an important contribution to the field.

Metaphysics

Dewey's naturalistic metaphysics first took shape in articles that he wrote during the decade after the publication of *Studies in Logical Theory*, a period when he was attempting to elucidate the implications of instrumentalism. Dewey disagreed with William James's assessment that pragmatic principles were metaphysically neutral. (He discusses this disagreement in "What Does Pragmatism Mean by Practical," published in 1908.) Dewey's view was based in part on an assessment of the motivations behind traditional metaphysics: a central aim of the metaphysical tradition had been the discovery of an immutable cognitive object that could serve as a foundation for knowledge. The pragmatic theory, by showing that knowledge is a product of an activity directed to the fulfillment of human purposes, and that a true (or warranted) belief is known to be such by the consequences of its employment rather than by any psychological or ontological foundations, rendered this longstanding aim of metaphysics, in Dewey's view, moot, and opened the door to renewed metaphysical discussion grounded firmly on an empirical basis.

Dewey begins to define the general form that an empirical metaphysics should take in a number of articles, including "The Postulate of Immediate Empiricism" (1905) and "Does Reality Possess Practical Character?" (1908). In the former article, Dewey asserts that things experienced empirically "are what they are experienced as." Dewey uses as an example a noise heard in a darkened room that is initially experienced as fearsome. Subsequent inquiry (e.g., turning on the lights and looking about) reveals that the noise was caused by a shade tapping against a window, and thus innocuous. But the subsequent inquiry, Dewey argues, does not change the initial status of the noise: it was experienced as fearsome, and in fact *was* fearsome. The point stems from the naturalistic roots of Dewey's logic. Our experience of the world is constituted by our interrelationship with it, a relationship that is imbued with practical import. The initial fearsomeness of the noise is the experiential correlate of the uncertain, problematic character of the situation, an uncertainty that is not merely subjective or mental, but a product of the potential inadequacy of previously established modes of behavior to deal effectively with the pragmatic

demands of present circumstances. The subsequent inquiry does not, therefore, uncover a reality (the innocuousness of the noise) underlying a mere appearance (its fearsomeness), but by settling the demands of the situation, it effects a change in the interdynamics of the organism-environment relationship of the initial situation--a change in reality.

There are two important implications of this line of thought that distinguish it from the metaphysical tradition. First, although inquiry is aimed at resolving the precarious and confusing aspects of experience to provide a stable basis for action, this does not imply the unreality of the unstable and contingent, nor justify its relegation to the status of mere appearance. Thus, for example, the usefulness and reliability of utilizing certain stable features of things encountered in our experience as a basis for classification does not justify according ultimate reality to essences or Platonic forms any more than, as rationalist metaphysicians in the modern era have thought, the similar usefulness of mathematical reasoning in understanding natural processes justifies the conclusion that the world can be exhaustively defined mathematically.

Second, the fact that the meanings we attribute to natural events might change in any particular in the future as renewed inquiries lead to more adequate understandings of natural events (as was implied by Dewey's fallibilism) does not entail that our experience of the world at any given time may as a whole be errant. Thus the implicit scepticism that underlies the representational theory of ideas and raises questions concerning the veracity of perceptual experience as such is unwarranted. Dewey stresses the point that sensations, hypotheses, ideas, etc., come into play to mediate our encounter with the world only in the context of active inquiry. Once inquiry is successful in resolving a problematic situation, mediatory sensations and ideas, as Dewey says, "drop out; and things are present to the agent in the most naively realistic fashion."

These contentions positioned Dewey's metaphysics within the territory of a naive realism, and in a number of his articles, such as "The Realism of Pragmatism" (1905), "Brief Studies in Realism" (1911), and "The Existence of the World as a Logical Problem" (1915), it is this view that Dewey expressly avows (a view that he carefully distinguishes from what he calls "presentational realism," which he attributes to a number of the other realists of his day). Opposing narrowminded positions that would accord full ontological status only to certain, typically the most stable or reliable, aspects of experience, Dewey argues for a position that recognizes the real significance of the multifarious richness of human experience.

Dewey offered a fuller statement of his metaphysics in 1925, with the publication of one of his most significant philosophical works, *Experience and Nature*. In the introductory chapter, Dewey stresses a familiar theme from his earlier writings: that previous metaphysicians, guided by unavowed biases for those aspects of experience that are relatively stable and secure, have illicitly reified these biases into narrow ontological presumptions, such as the temporal identity of substance, or the ultimate reality of forms or essences. Dewey finds this procedure so pervasive in the history of thought that he calls it simply *the* philosophic fallacy, and signals his intention to eschew the disastrous consequences of this approach by offering a descriptive account of all of the various generic features of human experience, whatever their character.

Dewey begins with the observation that the world as we experience it both individually and collectively is an admixture of the precarious, the transitory and contingent aspect of things, and the stable, the patterned regularity of natural processes that allows for prediction and human intervention. Honest metaphysical description must take into account both of these elements of experience. Dewey endeavors to do this by an event ontology. The world, rather than being

comprised of things or, in more traditional terms, substances, is comprised of happenings or occurrences that admit of both episodic uniqueness and general, structured order. Intrinsically events have an ineffable qualitative character by which they are immediately enjoyed or suffered, thus providing the basis for experienced value and aesthetic appreciation. Extrinsically events are connected to one another by patterns of change and development; any given event arises out of determinant prior conditions and leads to probable consequences. The patterns of these temporal processes is the proper subject matter of human knowledge--we know the world in terms of causal laws and mathematical relationships--but the instrumental value of understanding and controlling them should not blind us to the immediate, qualitative aspect of events; indeed, the value of scientific understanding is most significantly realized in the facility it affords for controlling the circumstances under which immediate enjoyments may be realized.

It is in terms of the distinction between qualitative immediacy and the structured order of events that Dewey understands the general pattern of human life and action. This understanding is captured by James' suggestive metaphor that human experience consists of an alternation of flights and perchings, an alternation of concentrated effort directed toward the achievement of foreseen aims, what Dewey calls "ends-in- view," with the fruition of effort in the immediate satisfaction of "consummatory experience." Dewey's insistence that human life follows the patterns of nature, as a part of nature, is the core tenet of his naturalistic outlook.

Dewey also addresses the social aspect of human experience facilitated by symbolic activity, particularly that of language. For Dewey the question of the nature of social relationships is a significant matter not only for social theory, but metaphysics as well, for it is from collective human activity, and specifically the development of shared meanings that govern this activity, that the mind arises. Thus rather than understanding the mind as a primitive and individual human endowment, and a precondition of conscious and intentional action, as was typical in the philosophical tradition since Descartes, Dewey offers a genetic analysis of mind as an emerging aspect of cooperative activity mediated by linguistic communication. Consciousness, in turn, is not to be understood as a domain of private awareness, but rather as the fulcrum point of the organism's readjustment to the challenge of novel conditions where the meanings and attitudes that formulate habitual behavioral responses to the environment fail to be adequate. Thus Dewey offers in the better part of a number of chapters of *Experience and Nature* a response to the traditional mind-body problem of the metaphysical tradition, a response that understands the mind as an emergent issue of natural processes, more particularly the web of interactive relationships between human beings and the world in which they live.

Ethical and Social Theory

Dewey's mature thought in ethics and social theory is not only intimately linked to the theory of knowledge in its founding conceptual framework and naturalistic standpoint, but also complementary to it in its emphasis on the social dimension of inquiry both in its processes and its consequences. In fact, it would be reasonable to claim that Dewey's theory of inquiry cannot be fully understood either in the meaning of its central tenets or the significance of its originality without considering how it applies to social aims and values, the central concern of his ethical and social theory.

Dewey rejected the atomistic understanding of society of the Hobbesian social contract theory, according to which the social, cooperative aspect of human life was grounded in the logically prior and fully articulated rational interests of individuals. Dewey's claim in *Experience and Nature* that the collection of meanings that constitute the mind have a social origin expresses the basic contention, one that he maintained throughout his career, that the human individual is a social being from the start, and that individual satisfaction and achievement can be realized only within the context of social habits and institutions that promote it.

Moral and social problems, for Dewey, are concerned with the guidance of human action to the achievement of socially defined ends that are productive of a satisfying life for individuals within the social context. Regarding the nature of what constitutes a satisfying life, Dewey was intentionally vague, out of his conviction that specific ends or goods can be defined only in particular socio-historical contexts. In the *Ethics* (1932) he speaks of the ends simply as the cultivation of interests in goods that recommend themselves in the light of calm reflection. In other works, such as *Human Nature and Conduct* and *Art as Experience*, he speaks of (1) the harmonizing of experience (the resolution of conflicts of habit and interest both within the individual and within society), (2) the release from tedium in favor of the enjoyment of variety and creative action, and (3) the expansion of meaning (the enrichment of the individual's appreciation of his or her circumstances within human culture and the world at large). The attunement of individual efforts to the promotion of these social ends constitutes, for Dewey, the central issue of ethical concern of the individual; the collective means for their realization is the paramount question of political policy.

Conceived in this manner, the appropriate method for solving moral and social questions is the same as that required for solving questions concerning matters of fact: an empirical method that is tied to an examination of problematic situations, the gathering of relevant facts, and the imaginative consideration of possible solutions that, when utilized, bring about a reconstruction and resolution of the original situations. Dewey, throughout his ethical and social writings, stressed the need for an open-ended, flexible, and experimental approach to problems of practice aimed at the determination of the conditions for the attainment of human goods and a critical examination of the consequences of means adopted to promote them, an approach that he called the "method of intelligence."

The central focus of Dewey's criticism of the tradition of ethical thought is its tendency to seek solutions to moral and social problems in dogmatic principles and simplistic criteria which in his view were incapable of dealing effectively with the changing requirements of human events. In *Reconstruction of Philosophy* and *The Quest for Certainty*, Dewey located the motivation of traditional dogmatic approaches in philosophy in the forlorn hope for security in an uncertain world, forlorn because the conservatism of these approaches has the effect of inhibiting the intelligent adaptation of human practice to the ineluctable changes in the physical and social environment. Ideals and values must be evaluated with respect to their social consequences, either as inhibitors or as valuable instruments for social progress, and Dewey argues that philosophy, because of the breadth of its concern and its critical approach, can play a crucial role in this evaluation.

In large part, then, Dewey's ideas in ethics and social theory were programmatic rather than substantive, defining the direction that he believed human thought and action must take in order to identify the conditions that promote the human good in its fullest sense, rather than specifying

particular formulae or principles for individual and social action. He studiously avoided participating in what he regarded as the unfortunate practice of previous moral philosophers of offering general rules that legislate universal standards of conduct. But there are strong suggestions in a number of his works of basic ethical and social positions. In *Human Nature and Conduct* Dewey approaches ethical inquiry through an analysis of human character informed by the principles of scientific psychology. The analysis is reminiscent of Aristotelian ethics, concentrating on the central role of habit in formulating the dispositions of action that comprise character, and the importance of reflective intelligence as a means of modifying habits and controlling disruptive desires and impulses in the pursuit of worthwhile ends.

The social condition for the flexible adaptation that Dewey believed was crucial for human advancement is a democratic form of life, not instituted merely by democratic forms of governance, but by the inculcation of democratic habits of cooperation and public spiritedness, productive of an organized, self-conscious community of individuals responding to society's needs by experimental and inventive, rather than dogmatic, means. The development of these democratic habits, Dewey argues in *School and Society* and *Democracy and Education,* must begin in the earliest years of a child's educational experience. Dewey rejected the notion that a child's education should be viewed as merely a preparation for civil life, during which disjoint facts and ideas are conveyed by the teacher and memorized by the student only to be utilized later on. The school should rather be viewed as an extension of civil society and continuous with it, and the student encouraged to operate as a member of a community, actively pursuing interests in cooperation with others. It is by a process of self-directed learning, guided by the cultural resources provided by teachers, that Dewey believed a child is best prepared for the demands of responsible membership within the democratic community.

Aesthetics

Dewey's one significant treatment of aesthetic theory is offered in *Art as Experience*, a book that was based on the William James Lectures that he delivered at Harvard University in 1931. The book stands out as a diversion into uncommon philosophical territory for Dewey, adumbrated only by a somewhat sketchy and tangential treatment of art in one chapter of *Experience and Nature*. The unique status of the work in Dewey's corpus evoked some criticism from Dewey's followers, most notably Stephen Pepper, who believed that it marked an unfortunate departure from the naturalistic standpoint of his instrumentalism, and a return to the idealistic viewpoints of his youth. On close reading, however, *Art as Experience* reveals a considerable continuity of Dewey's views on art with the main themes of his previous philosophical work, while offering an important and useful extension of those themes. Dewey had always stressed the importance of recognizing the significance and integrity of all aspects of human experience. His repeated complaint against the partiality and bias of the philosophical tradition expresses this theme. Consistent with this theme, Dewey took account of qualitative immediacy in *Experience and Nature,* and incorporated it into his view of the developmental nature of experience, for it is in the enjoyment of the immediacy of an integration and harmonization of meanings, in the "consummatory phase" of experience that, in Dewey's view, the fruition of the readaptation of the individual with environment is realized. These central themes are enriched and deepened in *Art as Experience,* making it one of Dewey's

most significant works.

The roots of aesthetic experience lie, Dewey argues, in commonplace experience, in the consummatory experiences that are ubiquitous in the course of human life. There is no legitimacy to the conceit cherished by some art enthusiasts that aesthetic enjoyment is the privileged endowment of the few. Whenever there is a coalesence into an immediately enjoyed qualitative unity of meanings and values drawn from previous experience and present circumstances, life then takes on an aesthetic quality--what Dewey called having "*an* experience." Nor is the creative work of the artist, in its broad parameters, unique. The process of intelligent use of materials and the imaginative development of possible solutions to problems issuing in a reconstruction of experience that affords immediate satisfaction, the process found in the creative work of artists, is also to be found in all intelligent and creative human activity. What distinguishes artistic creation is the relative stress laid upon the immediate enjoyment of unified qualitative complexity as the rationalizing aim of the activity itself, and the ability of the artist to achieve this aim by marshalling and refining the massive resources of human life, meanings, and values.

The senses play a key role in artistic creation and aesthetic appreciation. Dewey, however, argues against the view, stemming historically from the sensationalistic empiricism of David Hume, that interprets the content of sense experience simply in terms of the traditionally codified list of sense qualities, such as color, odor, texture, etc., divorced from the funded meanings of past experience. It is not only the sensible qualities present in the physical media the artist uses, but the wealth of meaning that attaches to these qualities, that constitute the material that is refined and unified in the process of artistic expression. The artist concentrates, clarifies, and vivifies these meanings in the artwork. The unifying element in this process is emotion--not the emotion of raw passion and outburst, but emotion that is reflected upon and used as a guide to the overall character of the artwork. Although Dewey insisted that emotion is not the significant content of the work of art, he clearly understands it to be the crucial tool of the artist's creative activity.

Dewey repeatedly returns in *Art as Experience* to a familiar theme of his critical reflections upon the history of ideas, namely that a distinction too strongly drawn too often sacrifices accuracy of account for a misguided simplicity. Two applications of this theme are worth mentioning here. Dewey rejects the sharp distinction often made in aesthetics between the matter and the form of an artwork. What Dewey objected to was the implicit suggestion that matter and form stand side by side, as it were, in the artwork as distinct and precisely distinguishable elements. For Dewey, form is better understood in a dynamic sense as the coordination and adjustment of the qualities and associated meanings that are integrated within the artwork.

A second misguided distinction that Dewey rejects is that between the artist as the active creator and the audience as the passive recipient of art. This distinction artificially truncates the artistic process by in effect suggesting that the process ends with the final artifact of the artist's creativity. Dewey argues that, to the contrary, the process is barren without the agency of the appreciator, whose active assimilation of the artist's work requires a recapitulation of many of the same processes of discrimination, comparison, and integration that are present in the artist's initial work, but now guided by the artist's perception and skill. Dewey underscores the point by distinguishing between the "art product," the painting, sculpture, etc., created by the artist, and the "work of art" proper, which is only realized through the active engagement of an astute audience.

Ever concerned with the interrelationships between the various domains of human activity and

concern, Dewey ends *Art as Experience* with a chapter devoted to the social implications of the arts. Art is a product of culture, and it is through art that the people of a given culture express the significance of their lives, as well as their hopes and ideals. Because art has its roots in the consummatory values experienced in the course of human life, its values have an affinity to commonplace values, an affinity that accords to art a critical office in relation to prevailing social conditions. Insofar as the possibility for a meaningful and satisfying life disclosed in the values embodied in art are not realized in the lives of the members of a society, the social relationships that preclude this realization are condemned. Dewey's specific target in this chapter was the conditions of workers in industrialized society, conditions which force upon the worker the performance of repetitive tasks that are devoid of personal interest and afford no satisfaction in personal accomplishment. The degree to which this critical function of art is ignored is a further indication of what Dewey regarded as the unfortunate distancing of the arts from the common pursuits and interests of ordinary life. The realization of art's social function requires the closure of this bifurcation.

Critical Reception and Influence

Dewey's philosophical work received varied responses from his philosophical colleagues during his lifetime. There were many philosophers who saw his work, as Dewey himself understood it, as a genuine attempt to apply the principles of an empirical naturalism to the perennial questions of philosophy, providing a beneficial clarification of issues and the concepts used to address them. Dewey's critics, however, often expressed the opinion that his views were more confusing than clarifying, and that they appeared to be more akin to idealism than the scientifically based naturalism Dewey expressly avowed. Notable in this connection are Dewey's disputes concerning the relation of the knowing subject to known objects with the realists Bertrand Russell, A. O. Lovejoy, and Evander Bradley McGilvery. Whereas these philosophers argued that the object of knowledge must be understood as existing apart from the knowing subject, setting the truth conditions for propositions, Dewey defended the view that things understood as isolated from any relationship with the human organism could not be objects of knowledge at all.

Dewey was sensitive and responsive to the criticisms brought against his views. He often attributed them to misinterpretations based on the traditional, philosophical connotations that some of his readers would attach to his terminology. This was clearly a fair assessment with respect to some of his critics. To take one example, Dewey used the term "experience," found throughout his philosophical writings, to denote the broad context of the human organism's interrelationship with its environment, not the domain of human thought alone, as some of his critics read him to mean. Dewey's concern for clarity of expression motivated efforts in his later writings to revise his terminology. Thus, for example, he later substituted "transaction" for his earlier "interaction" to denote the relationship between organism and environment, since the former better suggested a dynamic interdependence between the two, and in a new introduction to *Experience and Nature,* never published during his lifetime, he offered the term "culture" as an alternative to "experience." Late in his career he attempted a more sweeping revision of philosophical terminology in *Knowing and the Known,* written in collaboration with Arthur F. Bentley.

The influence of Dewey's work, along with that of the pragmatic school of thought itself, although

considerable in the first few decades of the twentieth century, was gradually eclipsed during the middle part of the century as other philosophical methods, such as those of the analytic school in England and America and phenomenology in continental Europe, grew to ascendency. Recent trends in philosophy, however, leading to the dissolution of these rigid paradigms, have led to approaches that continue and expand on the themes of Dewey's work. W. V. O. Quine's project of naturalizing epistemology works upon naturalistic presumptions anticipated in Dewey's own naturalistic theory of inquiry. The social dimension and function of belief systems, explored by Dewey and other pragmatists, has received renewed attention by such writers as Richard Rorty and Jrgen Habermas. American phenomenologists such as Sandra Rosenthal and James Edie have considered the affinities of phenomenology and pragmatism. The renewed openness and pluralism of recent philosophical discussion has meant a renewed interest in Dewey's philosophy, an interest that promises to continue for some time to come.

Denis Diderot (1713-1784)

Denis Diderot was the most prominent of the French Encyclopedists. He was educated by the Jesuits, and, refusing to enter one of the learned professions, was turned adrift by his father and came to Paris, where he lived from hand to mouth for a time. Gradually, however, he became recognized as one of the most powerful writers of the day. His first independent work was the *Essai sur le merite et la vertu* (1745). As one of the editors of the *Dictionnaire de medecine* (6 vols., Paris, 1746), he gained valuable experience in encyclopedic system. His *Pensees philosophiques* (The Hague, 1746), in which he attacked both atheism and the received Christianity, was burned by order of the Parliament of Paris.

In the circle of the leaders of the Enlightenment, Diderot's name became known especially by his *Lettre sur les aveugles* (London, 1749), which supported Locke's theory of knowledge. He attacked the conventional morality of the day, with the result (to which possibly an allusion to the mistress of a minister contributed) that he was imprisoned at Vincennes for three months. He was released by the influence of Voltaire's friend Mme. du Chatelet, and thenceforth was in close relation with the leaders of revolutionary thought. He had made very little pecuniary profit out of the *Encyclopedie*, and Grimm appealed on his behalf to Catherine of Russia, who in 1765 bought his library, allowing him the use of the books as long as he lived, and assigning him a yearly salary which a little later she paid him for fifty years in advance.

In 1773 she summoned him to St. Petersburg with Grimm to converse with him in person. On his return he lived until his death in a house provided by her, in comparative retirement but in unceasing labor on the undertakings of his party, writing (according to Grimm) two-thirds of Raynal's famous *Histoire philosophique*, and contributing some of the most rhetorical pages to Helvetius's De l'esprit and Holbach's *Systeme de la nature Systeme social*, and *Alorale universelle*. His numerous writings include the most varied forms of literary effort, from inept licentious tales and comedies which pointed away from the stiff classical style of the French drama and strongly influenced Lessing, to the most daring ethical and metaphysical speculations. Like his famous contemporary Samuel Johnson, he is said to have been more effective as a talker than as a writer; and his mental qualifications were rather those of a stimulating force than of a reasoned philosopher. His position gradually changed from theism to deism, then to materialism, and finally rested in a pantheistic sensualism In Sainte-Beuve's phrase, he was " the first great writer who belonged wholly and undividedly to modern democratic society," and his attacks on the political system of France were among the most potent causes of tile Revolution.

Diogenes Laertius (3rd cn. CE.)

Diogenes Laertius, native of Laerte in Cilicia, was a biographer of ancient Greek philosophers. His *Lives of the Philosophers* (*Philosophoi Biol*), in ten books, is still extant an is an important source of information on the development of Greek philosophy. The period when he lived is not exactly known, but it is supposed to have been during the reigns of Septimius Severus and Caracalla. Diogenes is thought to have belonged to the Epicurean School. He divides all the Greek philosophers into two classes: those of the Ionic and those of the Italic school. He derives the first from Anaximander, the second from Pythagoras. After Socrates, he divides the Ionian philosophers into three branches: (a) Plato and the Academics, down to Clitomachus; (b) the Cynics, down to Chrysippus; (c) Aristotle and Theophrastus. The series of Italic philosophers consists, after Pythagoras, of the following: Telanges, Xenophanes, Parmenides, Zeno of Elea, Leucippus, Democritus, and others down to Epicurus. The first seven books are devoted to the Ionic philosophers; the last three treat of the Italic school.

The work of Diogenes is a crude contribution towards the history of philosophy. It contains a brief account of the lives, doctrines, and sayings of most persons who have been called philosophers; and though the author is limited in his philosophical abilities and assessment of the various schools, the book is valuable as a collection of facts, which we could not have learned form any other source, and is entertaining as a sort of *pot-pourri* on the subject. The article on Epicurus is especially valuable, as containing some original letters of that philosopher, which comprise a summary of the Epicurean doctrines.

IEP

Diogenes of Apollonia (6th cn. BCE.)

Diogenes was a native of Apollonia in Crete, who was a pupil of Anaximenes and contemporary with Anaxagoras. Schleiermecher, however, affirms, from the internal evidence of the fragments of the two philosophers, that Diogenes preceded Anaxagoras. But Diogenes might have written before Anaxagoras and yet have been his junior, as we know was the case with Empedocles. Diogenes followed Anaximines in making air the primal element of all things; but he carried his views further, and regarded the universe as issuing from an intelligent principle, by which it was at once vivified and ordered, a rational as well as sensitive soul, but still without recognizing any distinction between matter and mind. Diogenes wrote several books on Cosmology *Peri Phuseos*.

Diogenes of Sinope (4th cn. BCE.)

Diogenes was a Cynic philosopher of Sinope. His father, Icesias, a banker, was convicted of debasing the public coin, and was obliged to leave the country; or, according to another account, his father and himself were charged with this offense, and the former was thrown into prison, while the son escaped and went to Athens. Here he attached himself, as a disciple, to Antisthenes, who was at the head of the Cynics. Antisthenes at first refused to admit him into his house and even struck him with a stick. Diogenes calmly bore the rebuke and said, "Strike me, Antisthenes, but you will never find a stick sufficiently hard to remove me from your presence, while you speak anything worth hearing." The philosopher was so much pleased with this reply that he at once admitted him among his scholars. Diogenes fully adopted the principles and character of his master. Renouncing every other object of ambition, he distinguished himself by his contempt of riches and honors and by his invectives against luxury. He wore a coarse cloak, carried a wallet and a staff, made the porticoes and other public places his habitation, and depended upon casual contributions for his daily bread. He asked a friend to procure him a cell to live in; when there was a delay, he took up abode in a *pithos*, or large tub, in the Metroum. It is probable, however, that this was only a temporary expression of indignation and contempt, and that he did not make it the settled place of his residence. This famous "tub" is indeed celebrated by Juvenal; it is also ridiculed by Lucian and mentioned by Seneca. But no notice is taken of this by other ancient writers who have mentioned this philosopher.

It cannot be doubted, however, that Diogenes practiced self-control and a most rigid abstinence -- exposing himself to the utmost extremes of heat and cold and living upon the simplest diet, casually supplied by the hand of charity. In his old age, sailing to Aegina, he was taken by pirates and carried to Crete, where he was exposed to sale in the public market. When the auctioneer asked him what he could do, he said, "I can govern men; therefore sell me to one who wants a master." Xeniades, a wealthy Corinthian, happening at that instant to pass by, was struck with the singularity of his reply and purchased him. On their arrival at Corinth, Xeniades gave him his freedom and committed to him the education of his children and the direction of his domestic concerns. Diogenes executed this trust with so much judgment and fidelity that Xeniades used to say that the gods had sent a good genius to his house.

During his residence at Corinth, an interview between him and Alexander is said to have taken place. Plutarch relates that Alexander, when at Corinth, receiving the congratulations of all ranks on being appointed to command the army of the Greeks against the Persians, missed Diogenes among the number, with whose character he was acquainted. Curious to see the one who exhibited such haughty independence of spirit, Alexander went in search of him and found him sitting in his tub in the sun. "I am Alexander the Great," said the monarch. "And I am Diogenes the Cynic," replied the philosopher. Alexander then requested that he would inform him what service he could render him. "Stand from between me and the sun," said the Cynic. Alexander, struck with the reply, said to his friends, who were ridiculing the whimsical singularity of the philosopher, "If I

were not Alexander, I should wish to be Diogenes." This story is too good to be omitted, but there are several circumstances which in some degree diminish its credibility. It supposes Diogenes to have lived in his tub at Corinth, whereas it is certain that he lived there in the house of Xeniades, and that, if he had ever dwelt in a tub, he left it behind him at Athens. Alexander, moreover, was at this time scarcely twenty years old, and could not call himself Alexander the Great, for he did not receive this title till his Persian and Indian expedition, after which he never returned to Greece; yet the whole transaction represents him as elated with the pride of conquest. Diogenes probably was visited by Alexander, when the latter held the general assembly of the Greeks at Corinth, and was received by him with rudeness and incivility, which may have given rise to the whole story. The philosopher at this time would have been about seventy years of age.

Various accounts are given concerning the manner and time of his death. It seems most probable that he died at Corinth, of mere decay, in the ninetieth year of his age and in the 114th Olympiad. A column of Parian marble, terminating in the figure of a dog, was raised over his tomb. His fellow-townsmen of Sinope also erected brazen statues in memory of the philosopher. Diogenes left behind him no system of philosophy. After the example of his school, he was more attentive to practical than to theoretical wisdom.

Divine Command Theory

The divine command theory is the view that moral actions are those which conform to God's will. Charity, for example, is morally proper because God endorses it, and murder is wrong because God condemns it. There are both normative and metaethical versions of this theory. The normative version is proposes a test for determining whether any action is right or wrong: if it conforms to God's will, it is morally permissible, if it does not, then it is impermissible. As a normative theory, the divine command theory is difficult to maintain given the epistemological problems of accessing the will of God. The metaethical version simply makes the factual claim that God's will is the foundation of morality. Here, the content of God's will does not have to be explored.

As a metaethical theory, there are three ways that the divine command theory can be understood. The weakest version claims only that, within certain religious communities, the meaning of the statement, "charity is good," is that God wills us to be charitable. This version has only limited implications. Although it may represent the views of a particular religious group, it has no bearing on what those outside that group mean by the statement "charity is good." A stronger version of the divine command theory concedes that charity is morally good in and of itself, but that God's will provides us with the motivation to be charitable. On this view, only the religious believer has the motivation to be moral. Theoretically, unbelievers could also act morally, but it would only be by accident since unbelievers would lack the motivation for consistent moral behavior. The strongest version of the divine command theory states that morality is a creation of God's will. According to this view, charity is good because God has willed that charity is good. The claim here is not about what particular communities mean by the word "good" or what motivations people have to be good. Instead, the claim is that moral conduct is identical to the conduct which God commands of us. This final version of the divine command theory is the most controversial, and has been criticized from several angles.

GENERAL CRITICISMS. During the Enlightenment, the divine command theory fell under attack from two distinct camps. One group argued that moral standards, like mathematical truths, are eternal and fixed in the nature of universe. Philosophers such as Samuel Clarke argued that moral values can be intuitively perceived and, again, like mathematical truths, can be understood by any rational being. Since God is a rational being, then God, too, endorses these eternal standards of morality. However, God's mere acceptance of moral standards in no way creates them, and in that sense is no different than a human's acceptance of moral standards. A second group argued that moral standards are fundamentally human-based, and are neither fixed in the nature of the universe, nor in the will of God. For example, Thomas Hobbes argued that moral standards are necessary human conventions which keep us out of a perpetual state of war. Others, such as Hume and Mill, argued that they are based on human instinct. In either case, God's will is irrelevant to ethical standards.

A more recent times, the divine command theory has been attacked on two principle grounds.

First, if morality is a dictate of God's will, then it is conceivable that God could choose to reverse the present state of morality and thus make evil actions moral. That is, God could make murder or stealing morally permissible if he chose. The theologian's reply to this possibility is that God would not reverse the moral standards he has created since God himself is infinitely good, and God would not will anything which is contrary to his own good nature. This reply, however, leads to the second problem with the divine command theory. If moral goodness is merely a creation of God's will, then the phrase "God is good" becomes meaningless. For, by definition, "God is good" would simply mean that God's nature is in accord with what he wills. Since there are no pre-existing moral restrictions to what God can will, then even if God was malicious, he would be good. Clearly, this makes nonsense of the notion of goodness.

QUINN'S DEFENSE. There has recently been a revived interest in divine command theory, particularly defending it against criticisms which have accumulated over the decades. In his essay, "The primacy of God's Will in Christian Ethics," Philip Quinn goes on the offensive and presents three arguments for why the divine command theory should be accepted by traditional theistic. Quinn concedes that his arguments will not carry weight for those outside the theistic traditions. Nevertheless, his arguments show the reasons which might incline a theist to adopt the divine command theory. Quinn's first argument is derived from what has been called the "immoralities of the patriarchs." In the Hebrew Bible, several of the Hebrew patriarchs are presented as committing seemingly immoral acts at God's command. Following the lead of medieval theologians, Quinn argues that these stories illustrate that moral standards are indeed creations of God. In these cases, God is temporarily revoking previously established moral standards for special purposes.

Quinn's second argument is distinctly Christian and draws from Jesus' command that we should love everyone. For Quinn, this is not merely an endorsement of a pre-existing standard of morality, since it is contrary to human nature to love everyone. It is in fact a new standard which was created by God's pronouncement. Quinn's third argument derives from the notion of divine sovereignty. Traditional theism holds that God is sovereign and in complete control of the universe. If this is so, then it seems that God is in control of moral standards, and, thus, the creator of moral standards. A problem occurs, though, when determining how far God's control extends. Michael Loux, for example, argues that God is absolutely sovereign and that if God happened to believe unconditionally that 2+2=3, then that would make 2+2=3. Quinn argues that this interpretation leads to absurd conclusions, and is therefore unacceptable. Nevertheless, the theist should accept as strong a version of sovereignty as possible (barring absurdity). A more narrow and more acceptable version of sovereignty is one where God is in control over moral standards, but not over math or logic. This bypasses the absurdities of absolute sovereignty. On this more narrow view, if God unconditionally believes specific moral standards, then this makes them so. Given that there is a connection between what God believes and what God wills, then this narrow version of sovereignty entails that moral standards are creations of God's will.

NIELSEN'S CRITICISMS. In "God and the Basis of Morality," Kai Nielsen presents several arguments showing that morality is not at all founded on the commands of God. Nielsen begins by presenting the classic dilemma of theological morality, as appears in Plato's dialog, The Euthyphro. Plato argues that there are two ways to see the relation between God and morality: (1) God creates the standards of morality, or (2) God himself is subject to standards of morality which are independent of him. Traditionally, each of these options are seen to have unfavorable consequences. If God creates morality, then God could make murder or stealing morally

permissible if he chose. If, on the other hand, God is subject to external standards of morality, then he loses some of his greatness. Nielsen presents six arguments which show that the second of these two options is by far the most preferable.

Nielsen's first argument is that merely commanding something does not make it moral. For example, if professor Jones commands her students to by a book, this does not make it morally right to buy that book. Nielsen begins his second argument noting that defenders of divine command theory often say that we are to find God's moral commands in scripture. But, according to Nielsen, this requires a prior conception of morality to judge that a certain text is indeed revelation. And this prior conception of morality must be independent of God and God's revelation. Third, it does not help the divine command theory to argue that the statement "God is good" is true by definition (the same way that "wives are women" is true by definition). For, the terms "God" and "good" are not identical, and to understand that statement we need a prior understanding of moral goodness which is independent of God. The same problems occur when we stipulate that the statement "God is absolute goodness" is true by definition. Fourth, the believer's choice to worship God indicates that the believer is using an independent standard of goodness by which she deems God worthy of worship. This also applies if the believer claims through faith alone that she believes God is worthy of worship. According to Nielsen, the believer's actual behavior shows that she is in fact appealing to an independent standard of goodness.

Nielsen's fifth criticism is an attack on the argument from divine sovereignty. The believer will argue that God created everything which exists, and this includes moral standards. But, according to Nielsen, it is logically impossible for God to create morality. For, technically, morality does not involve what exists (or is the case) but only what ought to be the case. Suppose, for example, that the universe was completely empty of any existing thing except yourself. You could still talk conditionally about what should or should not be done if someone was starving or drowning. Finally, Nielsen argues that the burden of proof is on the divine command theorist to show that there can be no morality if God does not exist. And this the believer cannot do. The believer may argue that a world without God is lonely, full of despair, without purpose, and without hope of immortality. Nielsen counters that life would still have particular purposes, such as the joys of music, and that life after death is only a myth which should be rejected in any event.

Dualism

The term "Dualism" was originally coined by Thomas Hyde around the beginning of the eighteenth century. As a metaphysical theory, dualism states that the world is made up of two elemental categories which are incommensurable. This includes distinctions between mind and body, good and evil, universal and particular, and phenomena and noumena. Dualism contends you must have both of the two components in question, rather than one or the other. In contrast to dualism two other philosophical positions concerned with the number of substances: monism and pluralism. Monism is the view that there is one elemental whereas pluralism maintains that there are many things which constitute the world.

A major problem faced by dualists is the inability to resolve the rift created between the two opposing elements. Typically the motivation for resolving conflicts between these two realms is to make the world more understandable. For instance, how is the interaction between mind and body explained? Descartes, for example, claimed that the pineal gland is the point of contact between the bodily and spiritual realm. The inability to rectify these two realms has inclined some to adopt monism. Science, for example, offers a monistic account of reality (physicalism) which eliminates the mental altogether. removes any problems of relatedness between mind and body by eliminating the spritual all together. Mental events are reduced to brain states, thus leaving only the bodily realm, thus monism.

Attempts have also been made to resolve the tension within mind/body dualism rather than eliminate either of the two components. Parallelism contends that the mind and body interact independently of one another. Thus having separate existences, they have no causal connection and have no interaction. Epiphenomenalism contends there is only a one-way causal connection from the body to the mind, but none from the mind to the body. Consciousness is just a byproduct of the body, much like smoke from a steam engine train.

Ryle and Smart try to minimize the mind/body gap by reducing long-term mental events, such as beliefs, to behavior, thus leaving only short-term mental events, such as pain. Others attempt to salvage dualist theories by switching elements within the mind or body. Rorty resolves the mind/body dualist problem by pointing out that it is only a conflict about privileged access (i.e., the mind part) vs. public access (i.e., the body part). The only gap we have from this distinction is epistemological rather than ontological. For Rorty we cannot know anything more than this simple distinction.

Duties and Deontological Ethics

A duty is a moral obligation that an agent has towards another person, such as the duty not to lie. Etymologically, duties are actions that are *due* to someone else, such as paying money that one owes to a creditor. In a broader sense, duties are simply actions that are morally manditory. Medieval philosophers such as Aquinas argued that we have specific duties or obligations to avoid committing specific sins. Since sins such as theft are absolute, then our duty to avoid stealing is also absolute, irrespective of any good consequences that might arise from particular acts of theft. From the 17th to the 19th centuries, many philosophers held the normative theory that moral conduct is that which follows a specific list of duties. These theories are also called *deontological* theories, from the Greek word *deon*, or duty, since they emphasize foundational duties or obligations. We find one of the first clear indications of this view in *The Law of War and Peace* (1625) by Dutch philosopher Hugo Grotius (1583-1645). For Grotius, our ultimate duties are fixed features of the universe, which even God cannot change, and comprise the chief obligations of natural law. Some moral theorists at the time based their list of duties on traditional lists of virtues.

TRADITIONAL DUTY THEORY. In *On the Law of Nature and of Nations* (1672), German philosopher Samual Pufendorf (1632-1694) refined three particular components of duty theory. First, Pufendorf adopts a position that scholars now call "the correlativity of rights and duties." On this view, every right that I have implies a duty on your part to respect my right. For example, if I have a right to own my car, then you have a duty not to steal my car. From a moral standpoint, Pufendorf believed that duties were more important than rights. Second, Pufendorf distinguished between perfect and imperfect duties. Perfect duties are obligations that are precisely defined, and dictate our proper conduct everywhere at all times, such as the duty not to steal. Imperfect duties, by contrast, such as the duty to be charitable, are not fixed, but open as to when and how we perform this duty. Third, Pufendorf provided a detailed categorization of all duties into three main groups: duties to God, duties to oneself, and duties to others. In the selection below, from The Duty of Man and Citizen (1673), Pufendorf argues that duties to others are the most foundational of the three, since this most immediately follows the mandate of natural law that we are to be sociable. Concerning our duties towards God, he argues that there are two kinds: (1) a theoretical duty to know the existence and nature of God, and (2) a practical duty to both inwardly and outwardly worship God. Concerning our duties towards oneself, these are also of two sorts: (1) duties of the soul, which involve developing one's skills and talents, and (2) duties of the body, which involve not harming our bodies such as through gluttony or drunkenness, and not killing oneself. Concerning our duties towards others, Pufendorf divides these between absolute duties, which are universally binding on people, and conditional duties, which are the result of contracts between people. Absolute duties are of three sorts: (1) avoid wronging others; (2) treat people as equals, and (3) promote the good of others. Conditional duties are far reaching and involve every aspect of social contracts and agreements. The first of these is to keep one's promises.

Pufendorf's division of moral duties quickly became a standard tool among moral theoriests for determining moral conduct. For example, Hume opens his essay "On Suicide" with the statement that "If

suicide be criminal, it must be a transgression of our duty either to God, our neighbour, or ourselves." German philosophers, such as Christian Wolff (1679-1754) and Alexander Gottleib Baumgarten (1714-1762), followed Pufendorf's key distinctions. Philosophers at this time also distinguished between direct duties and indirect duties. For example, I have a direct duty to show you respect, since you are immediately entitled to respect. By contrast, I have only an indirect duty to be respectful to the bodies of dead people; the dead person himself has no immediate entitlement to respect, but acting disrespectfully towards a corpse will negatively impact the living relatives of the dead person.

Problems with Traditional Duty Theory. One problem with traditional duty-based ethics involves the list of prescribed duties. What was self-evident in the 17th and 18th centuries seems less self-evident today. The existence and nature of God are more widely questioned now, hence it is speculation to claim that we have a set of duties toward God. Advocates of personal liberty question the traditional duties to ourselves. For example, the right to suicide is now widely defended, and the right to self-rule implies that I can let my faculties and abilities deteriorate if I so choose. Finally, many of the traditional duties to others have also been under fire. Defenders of personal liberty question our duties of benevolence, such as charity, and political duties, such as public spirit. For some, the traditional list of self-evident duties needs to be reduced to one: the duty to not harm others.

Another problem with traditional duty theory is that there is no clear procedure for resolving conflicts between duties. Suppose I am placed in a situation where I must choose between feeding myself to avoid starvation, or feeding my neighbor to keep her from starving. Consequentialist theories provide a clear formula for resolving this conflict: the morally correct choice is the one which produces the greatest benefit (either to myself, or to society at large). Traditional duty theory, by contrast, does not offer a procedure for determining which obligation is primary. Without such a procedure, it is inadequate in its present form.

KANT AND ROSS. German philosopher Immanuel Kant (1724-1804) draws on duty theory both in his early *Lectures on Ethics* (1780), and also in his later and more systematic ethical writings: *The Foundations of the Metaphysics of Morals* (1785), *The Critique of Practical Reason* (1788), and *The Metaphysics of Morals* (1798). In many of these ethical writings, Kant adopts the distinction between perfect/imperfect duties and direct/indirect duties. He also endorses the distinction between duties to oneself and duties to others, although he sees the traditional duties to God as more of a matter natural religion and less of a matter ethics. Kant further refines the notion of duty by arguing that moral actions are ultimately based on a single, "supreme principle of morality" which is objective, rational, and freely chosen: the categorical imperative. Although the categorical imperative is a single principle, Kant gives four formulations of it:

- The Formula of the Law of Nature: "Act as if the maxim of your action were to become through your will a universal law of nature."
- The Formula of the End Itself: "Act in such a way that you always treat humanity, whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end."
- The Formula of Autonomy: "So act that your will can regard itself at the same time as making universal law through its maxims."
- The Formula of the Kingdom of Ends: "So act as if you were through your maxims a law-making member of a kingdom of ends."

In the 19th century, Pufendorf's traditional view of duties fell into decline. German philosophers

followed Kant, and British philosophers gravitated towards utilitarianism, which offered a completely different account of the nature of moral obligation. The last serious attempt to revive duty-based ethics is W.D. Ross's *The Right and the Good* (1930). Like his 17th and 18th century counterparts, Ross argues that our duties are "part of the fundamental nature of the universe." Accordingly, Ross falls into the deontological (or nonconsequentialist) camp of ethicists. Ross believes that when we reflect on our actual moral convictions they reveal the following set of duties:

- Fidelity: the duty to keep promises
- Reparation: the duty to compensate others when we harm them
- Gratitude: the duty to thank those who help us
- Justice: the duty to recognize merit
- Beneficence: the duty to improve the conditions of others
- Self-improvement: the duty to improve our virtue and intelligence
- Nonmaleficence: the duty to not injure others

Although some of these duties are the same as those of traditional duty-based ethics, such as beneficence and self-improvement, Ross does not include duties to God, self-preservation, or political duties. By appealing to our actual moral convictions, Ross attempts to address the problem of including principles that are not duties by our standards today. This list is not complete, Ross argues, but he believes that at least some of these are self-evidently true.

He also addresses the problem of choosing between conflicting moral duties. For Ross, the above duties are prima facie (Latin for first appearance) insofar as we are under obligation unless a stronger duty shows up. If I am torn between two conflicting actions, such as preventing myself from starving or a neighbor from starving, I am under obligation to follow only the strongest of the two duties. Ross argues that there is no obvious priority among the principles, hence it will not necessarily be clear which is the stronger duty. To choose between conflicting duties, we must use our own insight on a case by case basis. For critics, the weakness in Ross's theory is that it rests too heavily on spontaneous moral intuition. We are given neither a definitive list of duties, nor a clear procedure for prioritizing our duties. Thus, only an immediate moral intuition will tell us both our possible duties and our primary obligation in the situation at hand.

Glossary of Terms in Eastern Philosophy

Amida: The most famous of the Celestial Buddhas in Mahayana Buddhism, who instituted a heavenly Buddha-Land called the Pure Land.

Analects (*Lun Yu*): Literally "digested conversations," the most reliable of all collections of Confucius's teachings, and one of the Four Books (*shu*) of Confucianism; the principal themes include humanity (*jen*), social custom (*li*), the superior person (*chun-tzu*), filial obedience (*hsiao*), the rectification of names (*cheng ming*), and good government.

Arhat: Literally "the worthy," Theravada Buddhist term referring to the ideal Buddhist who devotes himself full time to his individual achievement of nirvana.

Aryan: Light skinned migrating people, perhaps from Europe, who settled in India around 1500 BCE and instituted Vedic Hinduism.

Asoka: 3rd century king of India's Mauryan Dynasty who converted to Buddhism and helped its advance.

Asvaghosa: (1) 2nd century CE author of the *Life of Buddha* (*Buddhacarita*); (2) 5th century CE author of the *Awakening of Faith* (*Sraddhotpada-sastra*).

Atman-Brhaman: The notion of the Self-God in Brahmanic and Vedanta Hinduism which maintains that our true inner self is identical to the all pervasive God.

Awakening of Faith (*Sraddhotpada-sastra*): Mahayana Buddhist text of the 5th or 6th centuries CE by an otherwise unknown figure named Asvaghosha; the work which emphasizes ultimate reality as suchness (*tathata*).

Bhagavad Gita: Literally song of God, short philosophical dialog within the Hindu Mahabharata epic which discusses the Atman-Brahman and the ways of achieving liberation.

Bhagavata Purana: Most famous of the 18 major Puranas of Bhakti Hinduism; focusing on Krishna/Vishnu, the work synthesizes various Hindu traditions and presents a theistic version of monistic Vedanta.

Bhakti Hinduism: Devotional movement within Hinduism beginning around 300 CE which emphasizes the gods of the Trimurti.

Bodhisattva: Literally "enlightened being", ideal saint in Mahayana Buddhism who postpones his own enlightenment to assist others on their spiritual journey.

Brahma: Creator God of the Trimurti in Bhakti Hinduism.

Brahman: Hindu notion of the all-pervasive God who is identical to the self within us, especially as described in the *Upanishads* and Vedanta.

brahman: The notion of sacrificial power in Vedic Hinduism which was controlled by priests.

Brahmanism: Reform movement within Hinduism from 1000 BCE to 300 CE which de-emphasizes priestly sacrificial rites and emphasizes the notion of the Atman-Brahman (Self-God).

Brahmin: Priestly caste of people in Hinduism's caste system.

Buddha: literally "englightened one," Buddhist term which variously refers to Gautama Siddhartha, or any enlightened person. In Mahayana Buddhism the term may denote, an enlightened person who is a step higher than the Bodhisattva, a celestial Buddha, or ultimate reality itself.

Buddhaghosa: fourth century CE Buddhist philosopher and author of *The Path of Purity* (*Visuddhimagga*), among the most important texts in Theravada Buddhism written after the Pali Canon.

Buddha-Lands: In Mahayana Buddhism, heavenly realms instituted by Celestial Buddhas to which the devoted go after death; the most famous Pure Land is that of the Amida.

Buddha-Nature (*buddhata*): In Mahayana Buddhism, undifferientiated absolute existence behind all appearances, functionally the same as nirvana, emptiness, suchness, and the Eternal Buddha.

Buddhi: "Intellect"; in Samkya Hinduism *buddhi* is the first and most important manifestation of *prakriti* (physical nature).

Buddhism: Religion founded in India by Gautama Siddhartha (563-483 BCE) which stresses the four noble truths; Buddhism's main two main divisions are the Theravada and Mahayana schools.

Caste System (*jati*): Hereditary and hierarchical structuring of social groups within Hinduism traditionally including four castes (*varnas*): Priests (Brahmins), warriors (Ksatriyas), artisans (*Vaisyas*), and servants (*Sudras*).

Celestial Bodhisattva (*mahasattvas*): In Mahayana Buddhism, a heavenly or god-like Bodhisattva, similar to (and perhaps one step under) the Celestial Buddhas, the most famous of which is Avalokitesvara; showing devotion to Celestial Bodhisattvas results in them assisting us in our quest for enlightenment.

Celestial Buddha (*sambhogakaya*): in Mahayana Buddhism's Triple Body (*trikaya*) theory, these are heavenly or god-like Buddhas, the most famous of which is Amita; by showing devotion to Celestial Buddhas they assist us in our quest for enlightenment.

Celestial Masters: Sect of Religious Taoism formed by Chang Tao Ling in the 2nd century CE which holds that divine rulers reward and punish us based on our good and evil actions.

Ch'an: School of Chinese Mahayana Buddhism (Zen in Japan), founded by a legendary figure named Bodhidharma (470-543 CE), the key philosophical text of which is the *Platform Sutra* of Hui-neng; all sub-schools of Ch'an emphasize experience over doctrine, and the practice of seated meditation. The Rinsai school also emphasizes the koan system.

Ch'i: literally "breath," important philosophical term of varied meaning throughout Chinese history;

early Chinese writings see it as a physiological principle of vital energy, whereas Neo-Confucian writers such as Chu Hsi see it as a metaphysical principal of material force in contrast with structural form (*li*).

Chou Tun-i (1017-1073): Founder of Neo-Confucianism whose short work *Explanation on the Diagram of the Great Ultimate* describes how all things emerged from the Great Ultimate by means of its yang activity and yin inactivity.

Chu Hsi (1130-1200): Most influential Neo-Confucian philosopher whose interpretation of Confucianism became the standard view until the 20th century; for Chu, the "investigation of things" involves knowledge of the structural form (*li*) of the universe, as distinct from the material force of the universt (*ch'i*).

Chuang-Tzu (369-286 BCE): Second of the great Taoist philosophers, attributed with composing the first portion of the text titled the *Chuang-Tzu*; using colorful stories, the text describes the notions of the Tao, non-action, non-mind, transformation, and freedom artificial social constraints.

Citta: "Ordinary consciousness" in Hindu Yoga, as contrasted with *purusha* (our inner transcendent self).

Confucianism: Religious and philosophical system of China based on the teachings of Confucius which emphasizes social values such as filial obedience, custom, and governing by way of example.

Confucius (551-479 BCE): Latinized name for Kung Fu-tzu, Chinese founder of Confucianism whose sayings are preserved in the *Analects*.

Darsanas: Formal systems of emancipation in Hinduism from the 7th century CE and on; the six traditional schools are, Samkya, Nyaya, Vaisesika, Mimamsa, Yoga, and Vedanta.

Dependent Origin (*paticca-samuppada*): Buddhist doctrine that everything that occurs in the world is the result of prior causes. All mental events, appearances, and external events arise from previous events. The various causal chains culminate in suffering (*dukkha*). Only nirvana is not subject to such causal interactions.

Desire (*tanha, trishna*): Second noble truth of Buddhism which designates that suffering results from craving sensory and mental objects.

Devi Bhagavata Purana: Composed around the 15th century, one of the major *Puranas* of Bhakti Hinduism which focuses on the Goddess Devi, they mythological wife of Shiva; the text is central to proponents of Shaktsm

Dharma: in Hinduism, social duty including the caste system and four stages of life (*asramana*). In Buddhism, *dharma* refers to the teachings of Buddha.

Dharmasastras: "Law books" in Hinduism such as the *Law of Manu* which mandate social duties (*dharma*).

Divination: An attempt to understand communication from the dead by means of various signs; the *I Ching*, one of the Five Classics of Confucianism, is the most noted of these in popular Chinese belief systems.

Doctrine of the Mean (*Chung Yung*): philosophical section from the *Book of Rites* which advocates

maintaining a mental state of equilibrium between extreme emotions; it is one of the Four Books (*shu*) of Confucianism.

Dravidian: Original dark skinned inhabitants of India's Indus Valley civilization from 3500-1500 BCE.

Eightfold Path: Fourth noble truth of Buddhism, also called the "middle path," which includes proper cultivation of the following: views, aims, speech, conduct, livelihood, effort, mindfulness, and contemplation.

Emptiness (*sunyata*): Central notion in Mahayana Buddhism that ultimate reality is not discoverable; the term is functionally the same as nirvana, Buddha-nature, suchness, and the Eternal Buddha.

Eternal Buddha (*dharmakaya*): In Mahayana Buddhism's Triple Body (*trikaya*) theory, the Eternal Buddha is undifferientiated absolute existence behind all appearances, and functionally the same as nirvana, emptiness, Buddha-nature, and suchness.

Filial Obedience (*hsiao*): Central Confucian concept designating respect for elders.

Five Classics (*ching*): 12th century CE designation for five early Chinese classical texts which were purportedly compiled by Confucius; they are The *Book of Changes* (*I Ching*), *Book of History* (*Shu Ching*), *Book of Poetry* (*Shih Ching*), *Record of Rites* (*Li Chi*), *Spring and Autumn Annals* (*Ch'un Ch'iu*).

Five Elements (*wu-hsing*): Five principal substances in Chinese thought, which are wood, fire, earth, metal, and water.

Five Relationships: Traditional Confucian superior-subordinate social relationships between (1) father and son, (2) elder brother and younger brother, (3) husband and wife, (4) elder friend and junior friend, and (5) ruler and subject.

Four Books (*shu*): 12th century CE designation for four early Confucian philosophical writings; they are the *The Analects* (*Lun Yu*), (2) *The Great Learning* (*Ta Hsueh*), *The Doctrine of the Mean* (*Chung Yung*), *The Mencius* (*Meng-tzu*).

Four Goals of Life (*purusharthas*): Ideal aims of life in Hindu social duty (dharma), including pleasure (*kama*), success (*artha*), right conduct (*dharma*), and liberation (*moksha*).

Four Noble Truths: central doctrine of Buddhism which contends that (1) life is suffering, (2) suffering comes from desire, (3) extinguishing desire (nirvana) ends suffering, and (4) desire is extinguished through the eightfold path (or the middle way).

Four Stages of Life (*asramana*): Hindu social duty (*dharma*) designating four ideal life stages: student (*brahmacarin*), householder (*grihashta*), forest dweller (*vanaprastha*), and ascetic (sannysin).

Gautama: Family name of Gautama Siddhartha (563-483 BCE), known as "The Buddha" and founder of Buddhism.

Good Government: View in the Confucian *Analects* that rulers should rule by setting a moral example which the whole country will follow.

Great Learning (*Ta Hsio*): Short philosophical section from the *Book of Rites* which states that a ruler's virtuous conduct will be transferred down the social hierarchy to the people; it is one of the Four Books

(*shu*) of Confucianism.

Great Ultimate (*t'ai-chi*): Main productive force of the universe as described in the *I Ching* and developed by Neo-Confucianism.

Gunas: Literally "strands"; three essential features of *prakriti* (our physical nature) in the Samkya school of Hinduism; the three *gunas* are consciousness (*sattva*), activity (*rajas*), and inactivity (*tamas*).

Han Dynasty: Period in Chinese history from 206 BCE- 220 CE during which time Confucianism became the dominant religion.

Hinayana: "Little raft" school of Buddhism as so named by their Mahayana Buddhist rivals; the school later changed its name to "Theravada."

Hindu: General term designating the religion of India and its various movements including Vedic Hinduism, Brahmanism, and Bhakti Hinduism.

Hsuan-tsang (596-664 CE): Chinese Mahayana philosopher who followed the Yogacara School, thus founding in China the School of Consciousness-Only (*Fa-hsiang*).

Hsun-Tzu (298-238 BCE): Early skeptical Confucian philosopher who argued that all events are in accord with natural law, and that humans are by nature selfish; his writings are collected in a work titled *The Hsun-Tzu*.

Hui-neng (638-713 CE): Sixth and final Chinese Patriarch of Ch'an Buddhism whose life and teachings are presented in the *Platform Sutra* (*Liu-tsu-ta-shih Fa-pao-t'an-ching*).

Humanity (*jen*): Central Confucian concept advocating benevolent action towards people.

I Ching: Literally "Book of Changes," a book of written oracles associated with 64 abstract figures; one of the Five Classics of Confucianism.

Identity of Opposites: Taoist notion of the *Chuang-Tzu* that opposing descriptions of things are relative and in fact point to a single underlying reality.

Investigation of Things: Concept in the *Great Learning* which prompts moral conduct which, in turn, culminates in social happiness; Neo-Confucianist Chu Hsi identified this with a study of structural form (*li*), in contrast to Lu Hsiang-shan and Wang Yang Ming who identified it with the study of mind and its innate knowledge.

Isvarakrsna: 4th century CE founder of the Hindu school of Samkya; author of *Samkhyakarika* (literally "Verses on the Samkhya").

Karma Yoga: Sub-school of Hindu Yoga which advocates becoming indifferent to the consequences of one's actions, thereby disassociating oneself from one's ordinary consciousness

Karma, law of: Hindu view that the good and bad consequences of one's actions affect one's status in future lives (*samsara*)

Karma: "Action" in Hinduism and Buddhism, often associated with the doctrine of karma.

Ko Hung (280-340 CE): Author of the Religious Taoist text *Book of the Master who Embraces*

Simplicity (Pao-p'u-tzu) which describes various techniques for attaining immortality.

Koan System: Instruction technique of the Rinsai school of Zen Buddhism in which a master poses a series of koans to his students over a period of several years.

Koan: Paradoxical question posed by Zen masters using the koan system, such as "what is the sound of one hand clapping?"

Krishna: Legendary Hindu figure in the Bhagavad Gita who is said to be a human incarnation of the god Vishnu.

Kuo Hsiang (d. 312 CE): Neo-Taoist philosopher who emphasized that the Tao is non-existence, and things arise from nature (*t'ien*).

Lankavatra Sutra: 4th century CE Mahayana Buddhist text of the Yogacara school which is most noted for its lengthy discussion of nirvana in Chapter 8.

Lao-Tzu: Legendary founder of Taoism and author of the *Tao Te Ching*, who is said to have been an older contemporary of Confucius.

Li: Important philosophical term of varied meaning throughout Confucian history; Early Confucian writings depict *li* as ceremonial formality; Neo-Confucian writers such as Chu Hsi see it as a metaphysical principal of structural form, which is in contrast with material force (*ch'i*).

Lieh-Tzu (c. 450-375 BCE): Early Taoist philosopher of whom almost nothing is known; a third century CE text by the name *Lieh-Tzu* is pseudonymously attributed to him which emphasizes the certainty of our annihilation, resigning oneself to fate, and avoiding all effort in life.

Lotus Sutra (*saddharma-pundarika*): An early Mahayana Buddhist text (composed between 100 BCE and 200 CE) which emphasizes the means-to-ends ability (*upaya*).

Lu Hsiang-Shan (1139-1193): Neo-Confucian philosopher and founder of the School of Mind; Lu argued that knowledge of the world and morals is inntate to our minds, and that there is only one universal mind.

Mahayana: "Large raft" school of Buddhism which sees religion as a group effort, emphasizes the role of the Bodhisattva, sees nirvana as the same state as the ordinary realm of life and death, and describes ultimate reality as emptiness, suchness and Buddha-nature.

Manu, Law of (*Manava Dharmasastra*): Most famous of the Hindu codes of law (*Dharmasastras*), written about 200 BCE.

Mara: Hindu god of pestilence, better known as the tempter who tried to foil Buddha's attainment of enlightenment

Material Force (*ch'i*): Neo-Confucian term used by writers such as Chu Hsi who see it as a metaphysical principal in contrast with structural form (*li*).

Maya: Hindu term coined by Advaita Vedanta to refer to the illusory or deceptive nature of the world which prompts us to make distinctions.

Mencius (390-305 BCE): Latinized name for Meng-tzu, the most important Confucian writer after Confucius; Mencius emphisized the importance of humanity (*jen*) and righteousness (*i*), and argued that human nature is essentially good. His writings, the *Mencius*, are one of the Four Books (*shu*) of Confucianism.

Middle Path (*majjhimapatipada*): Central doctrine taught by Buddha concerning the avoidance of extremes as a means of attaining enlightenment; early Buddhist writings associate the Middle Path with the Eightfold Path.

Middle Path School (*madhyamika*): Indian school of Mayanana Buddhism founded by Nagarjuna in the 2nd century CE, emphasizing the emptiness of all things, including nirvana and the ordinary world of life and death; the school continued in China as the School of Consciousness-Only (*Fa-hsiang*).

Moksha: "Release"; Hindu notion of the ending of the cycle of reincarnation (*samsara*); also associated with the highest stage of religious awareness and Yoga meditation.

Mo-Tzu (480-390 BCE): Early Chinese philosopher and founder of Mohism who criticized Confucianism for being too ritualistic and socially passive; Mo-tzu argued that, to ward off social chaos, we should love everyone as a matter of self-interest.

Nagarjuna (c. 150-250 CE): Founder of the Middle Path School of Mahayana Buddhism, and author of the *Treatise on the Fundamentals of the Middle Path* (*Mulamadhyamakakarika*), which emphasizes the emptiness of all things.

Neo-Confucianism: Broad Confucian movement beginning in the 11th century CE which developed metaphysical doctrines at times borrowing from Buddhism and Taoism; founded by Chou Tun-i, other leading Neo-Confucianists were Chu Hsi, Lu Hsiang-shan, and Wang Yang Ming.

Neo-Taoism: Movement within Philosophical Taoism during the 3rd and 4th centuries CE which drew from Confucianism; leading proponents are Wang Pi, Ho Yen, Hsiang Hsiu and Kuo Hsiang.

Neti Neti: Literally, "not this, not this"; famous Hindu expression from the *Brihadaranyaka Upanishad* which indicates that the Atman cannot be identified with this or that particular physical thing.

Nirvana: Literally "to extinguish," highest state of existence in Buddhism; in Theravada Buddhism nirvana is a realm beyond ordinary consciousness, and in Mahayana Buddhism nirvana is the same empty realm as ordinary conscious existence.

No Self (*anatta*): Buddhist doctrine that we have not unified and individual self, but only a fluctuating series of material and conscious states (*skandhas*). No self is one of the Three Marks of Existence (*ti-lakkhana*) in Buddhism.

Non-Action (*wu-wei*): Taoist position that we should avoid all unnatural action and act passively and spontaneously.

Non-Mind (*wu-tsin*): Taoist position that we should eliminate knowledge to allow us to live spontaneously.

Pali Canon: the oldest sacred collection of Buddhist writings from the 3rd-1st centuries BCE, written in the Pali language, and comprising three main divisions: the "Basket of Discipline" (Vinaya Pitaka), the

"Basket of Discourses" (Sutta Pitaka), and the "Basket of Ultimate Doctrine" (Abhidhamma Pitaka).

Paramita: Literally "perfections"; Mahayana Buddhism notes 10 perfections of the ideal bodhisattva: giving (*dana*), morality (*sila*), patience (*ksanti*), vigor (*virya*), contemplation (*dhyana*), wisdom (*prajna*), means-to-ends ability (*upaya*), resolution (*pranidhana*), strength (*bala*), and knowledge (*jnana*).

Patanjali: Unknown Hindu figure from the 4th-6th centuries CE, and author of the *Yoga Sutra* which describes eight steps to meditation.

Perfection of Wisdom (*prajnaparamita*): In Mahayana Buddhism, an early collection of writings beginning about 100 BCE which focuses on the importance of wisdom among the ten ideal perfections (*paramitas*); emphasizing the notion of emptiness (*sunyata*), the most famous of these works are the *Diamond Cutter Sutra* (*vajracchedika-prajnaparaita*) and the *Heart Sutra* (*prajnaparamita-hydaya*).

Period of 100 Philosophers: period of philosophical creativity in reaction to China's warring states period (403-221 BCE), later classed into six schools: Confucianism, Taoism, Mohism, Yin and Yang School, Logicians, and Legalism.

Philosophical Taoism (*tao-chia*): Early non-religious direction of Taoism as found in the *Tao Te Ching*, the *Chuang-Tzu*, the *Lieh-Tzu*, Neo-Taoism.

Prajna: Literally, "wisdom", one of the ten perfections (*paramitas*) of Mahayana Buddhism; this wisdom is usually seen as an understanding of the emptiness of all things.

Prakriti: Notion of our physical nature in the Samkya and Yoga systems of Hinduism; contrasted with *purusha* (inner transcendent self).

Pratyekabuddha: The isolated practitioner of Theravada Buddhism who seeks enlightenment outside of a formal monastic setting; by contrast, the Arhat seeks enlightenment within a formal monastic setting.

Purana: Devotional literature of Bhakti Hinduism, the most famous of which is the *Bhagavata Purana* which describes the life of Krishna; there are 18 authoritative "great" *Puranas*, and 18 authoritative "minor" *Puranas*.

Pure Land Buddhism: School of Mahayana Buddhism founded in China by Tao-cho (562-645 CE) which emphasizes devotion to Amida, the Celestial Buddha who founded a heavenly Buddha-Land called the Pure Land which awaits his followers upon their deaths.

Purusha: Notion of one's inner transcendent self in the Samkya and Yoga systems of Hinduism; contrasted with *prakriti* (our physical nature) which hides our inner self.

Questions of King Milinda (*Milindapanha*): Important Theravada Buddhist philosophical text written about 100 CE in the Pali language; the issues discussed include the self, karma, and reincarnation.

Ramanuja: 11th century CE Hindu founder of *Visista-advaita* Vedanta (qualified monistic Vedanta) who maintains that God himself is composed of parts; individual souls and the physical world comprise the body of God.

Rectification of Names (*cheng ming*): Central Confucian concept involving the correct use of language such that words and actions conform to reality.

Religious Taoism (*Tao-chiao*): Later development within the Taoist tradition which emphasized techniques of attaining physical immortality in this life.

Return (*fu, fan*): Taoist notion that all things follow a natural process by which they grow from the Tao, and then disintegrate into the Tao.

Samadhi: "without support"; the highest stage of meditation in Hinduism's school of Raja Yoga.

Samkya: One of the six Hindu systems of emancipation (Darsanas) which emphasizes a distinction between *purusha* (our inner transcendent self) and *prakriti* (our physical nature).

Samsara: Hindu notion of reincarnation in which one's present life is followed by a series of new lives in new physical bodies.

Sangha: General term referring to religious communities in India; in Buddhism the *Sangha* refers either more narrowly to the monastic communites, or more broadly to the Buddhist community consisting of the both lay and monastic practitioners.

Sankara (788-820 CE): Hindu founder of Advaita Vedanta, a monistic (or nondual) interpretation of Vedanta philosophy; Sankara emphasizes the unity of the individual self and the larger world; the deceptive (*maya*) nature of the world prompts us to erroneously distinguish the two.

Sanskrit: Ancient Indo-European language in which the classic texts of Hinduism are written.

Satori: Term for "enlightenment" in Zen Buddhism.

School of Mind (*Hsin-Hsueh*): Idealist-oriented Neo-Confucian school founded by Lu Hsiang-Shan which emphasized innate knowledge of the mind.

School of Structural Form (*Li-Hsueh*): Rationalist-oriented Neo-Confucianist school founded by Chu Hsi which emphasized understanding the structural form (li) behind things.

Seated Meditation (*zazen*): Zen Buddhist practice of sitting and meditating on ordinary conscious experience for long periods of time.

Seng-chao (384-414 CE): Chinese Mahayana philosopher who followed the Middle Path School of Nagarjuna.

Shakti: Hindu notion of creative power, associated with the Goddess Devi, wife of Shiva.

Shaktism: Hindu tradition which focuses on the creative power (*shakti*) of the Goddess Devi, wife of Shiva.

Shiva: destroyer God of the Trimurti in Bhakti Hinduism.

Siddhartha: First name of Gautama Siddhartha (563-483 BCE), known as "The Buddha" and founder of Buddhism.

Skandhas: Literally "heaps," sometimes translated as "aggregates" or "components"; in Buddhism, there are five *skandhas* which shape our human perception of things: matter, sensation, perception, predisposition, and consciousness.

Social Custom (*li*): Central Confucian concept advocating effortless adherence to social norms and performance of social rituals.

Ssu-ma Ch'ien: Author of classic Chinese historical text titled *Historical Records* (c. 100 BCE) which contains brief accounts of Confucius, Lao-tzu, and Chuang-tzu.

Structural Form (*li*): Neo-Confucian term used by writers such as Chu Hsi who see it as a metaphysical principal in contrast with material force (*ch'i*).

Suchness (*tathata*): Mahayana Buddhist notion of ultimate reality which designates existence as it is in itself, as opposed to how it appears to us; the term is functionally the same as nirvana, Buddha-nature, emptiness, and the Eternal Buddha.

Suffering (*dukkha*): First noble truth of Buddhism which designates a state of anguish that results from clinging or grasping (*tanha, trishna*). Suffering is one of the Three Marks of Existence (*ti-lakkhana*) in Buddhism.

Summit of Nothingness (*wu-chi*): Taoist concept of the realm of nonexistence from which all things emerge and then return (*fu*); Neo-Confucianists such as Chou Tun-i and Chu Hsi identified the Summit of Nothingness with the Great Ultimate (*t'ai-chi*).

Superior Person (*chun-tzu*): Central Confucian concept designating the ideal human who personifies the highest moral attributes.

Tao Te Ching: Literally, "The Way and its Power"; oldest and most important text in Taoism which emphasizes living according to the Tao, the virtuous power (*te*) we attain from the Tao, the return of everything to Tao, and the principles of non-action, non-mind.

Taoism: Chinese movement originating in the warring states period which advocates following the Tao and living in harmony with nature; "Philosophical Taoism" and "Religious Taoism" are its two principal approaches.

Tat Tvam Asi: Literally "you are that"; Hindu expression in the *Chandogya Upanishads* indicating that the individual person is identical with the universal Brahman.

Tathagata: Literally, "thus gone," an honorary title used by Buddha in reference to himself, perhaps indicating that he has "gone before" others on the path of enlightenment.

The Record of Rites (*Li Chi*): One of the Five Classics of Confucianism, an anthology of rules of dancing, music, ancestor worship, and imperial sacrifices; it contains philosophical discussions on cosmology, yin and yang, the five elements, and the five relationships.

Theravada: Literally "way of the elders," later designation for the Hinayana school of Buddhism which sees religion as an individual effort, emphasizes the role of the Arhat, sees nirvana as distinct from ordinary existence, and de-emphasizes metaphysical speculations.

Three Jewels (*tiratana*): The three most precious things in Buddhism, namely, the Buddha, the law (*dharma*), and the Buddhist community (*sangha*)

Three Marks of Existence (*ti-lakkhana*): Buddhist designation for three aspects of human physical existence: suffering (*dukkha*), impermanence (*anicca*), and no self (*anatta*).

T'ien: Chinese term for "heaven" used in philosophical Neo-Confucianist and Neo-Taoist discussions to mean "nature"

T'ien-t'ai: School of Chinese Mahayana Buddhism (Tendai in Japan), founded by Chih-I (538-597 CE); the school follows the Yogacara doctrine of absolute mind and proposes that three thousand realms of the phenomenal world are contained in a single thought.

Transformation (*hua*): Taoist notion in the Chuang-Tzu that everything in nature involves transformation from one state to another.

Treatise on Actions and their Rewards (*T'ai-shang Kan-ying P'ien*): 10th century text of Religious Taoism which maintains that people lose longevity in proportion to their evil deeds.

Trimurrti: Trimorphic view of God in Bhakti Hinduism consisting of Brahma, Vishnu, and Shiva.

Tripitika: Literally "three baskets", another name for the Buddhist Pali Canon.

Triple Body (*trikaya*): In Mahayana Buddhism, the notion of three levels or "bodies" of Buddha's existence: (a) the Eternal Buddhas of the Body of Dharma (*dharmakaya*), (2) human incarnations in the Body of Transformation (*nirmanakaya*), and (3) Celestial Buddhas in the Body of Bliss (*sambhogakaya*).

Upanishads: 108 philosophical texts of Brahmanic Hinduism composed between 800-500 BCE which emphasize the notion of the Atman-Brahman.

Upaya: "Means-to-ends ability," or "useful means," one of the ten perfections (*paramitas*) of Mahayana Buddhism; *upaya* typically involves the use of differing (and sometimes inferior) approaches to enlightenment.

Vedanta: Literally "end of the Vedas"; one of Hinduism's formal schools of emancipation (*darsanas*) which draws heavily on the *Upanishads* and the *Brahma Sutras* and the doctrine of the Atman Brahman; its two main sub-schools are Sankara's *Advaita* Vedanta (monistic Vedanta) and Ramanuja's *Visista-advaita* Vedanta (qualified monistic Vedanta).

Vedas: Hindu sacred texts of the Aryan invaders written between 1500-800 BCE which includes the Rig-Veda, Sama-Veda, Yajur-Veda, and Arth-Veda.

Vedic Hinduism: Religion of the India's Aryan invaders (1500-800 BCE), the sacred text of which is the Vedas

Vishnu: The preserver God of the Trimurti in Bhakti Hinduism who is said to have human incarnations (*avitars*).

Wang Yang Ming (1472-1529): Philosopher and statesman, and leading proponent of the Neo-Confucianist School of Mind; Wang argued that all knowledge is innate to our minds, and that knowledge and actions are co-related.

Warring States Period: period social and political unrest in China's history from 403-221 BCE in reaction to which China's classical philosophy emerged.

Way of Supreme Peace (*t'ai-p'ing tao*): Messianic sect of Religious Taoism founded by Chang Chueh (d. 184 CE) which emphasized based formal fasting ceremonies (*chai*) involving ritual healing and

public confession of fault.

Yang Chu (c. 450 BCE): Early Chinese philosopher who emphasized self-preservation and may have inspired Taoist notions about the evils of society.

Yang Chu Chapter: Famous chapter in the *Leih-Tzu* text arguing that we should enjoy the pleasures of life while we can since death is certain.

Yin and Yang: negative (female) and postive (male) complementary forces of the universe central to Chinese thought since perhaps as early as 1,000 BCE.

Yoga: Hindu meditative practices; the formal school of Yoga developed in the middle ages contains seven sub-schools: Jnana Yoga (knowldge), Karma Yoga (action), Bhakti Yoga (devotion), Mantra Yoga (sounds), Laya Yoga (dissolution), Hatha Yoga (postures, breathing), and Raja Yoga (meditation).

Yogacara School: Idealist school of Mahayana Buddhism founded in the 4th century CE by two brothers, Asanga and Vasubandhu; the school maintains that ultimate realty is an undiffernentiated mind; eight kinds of mental consciousness are responsible for our erroneous perceptions of an external world and differientiated self.

Zen: Japanese name for the Chinese school of Ch'an Buddhism. (See Ch'an).

Meister Eckhart (1260-1328)

Meister Eckhart, as he is generally called, Dominican and mystic, was a man almost forgotten after the middle of the fifteenth century until Franz von Baader in the first half of the nineteenth century revived his memory. Since then he has been highly praised. But Denifle again passed a somewhat derogatory judgment upon him on the basis of newly discovered Latin writings; inasmuch as Denifle has published but a small part of these writings his opinion cannot be too implicitly accepted. This article will attempt merely to give accredited facts and indicate the present state of the questions.

LIFE. The long controverted question concerning the locality of Eckhart's origin has been settled by Denifle, who states that he was born at Hochheim, a village 8 miles north of Gotha. The year of his birth was probably 1260, and he joined the Dominicans at Erfurt. The lighter studies he no doubt followed at Cologne. Later he was prior at Erfurt and provincial of Thuringia. In 1300 he was sent to Paris to lecture and take the academical degrees, and remained there till 1303. In the latter year he returned to Erfurt, and was made provincial for Saxony, a province which reached at that time from the Netherlands to Livonia. Complaints made against him and the provincial of Teutonia at the general chapter held in Paris in 1306 concerning irregularities among the ternaries, must have been trivial, because the general, Aymeric, appointed him in the following year his vicar-general for Bohemia with full power to set the demoralized monasteries there in order. In 1311 Eckhart was appointed by the general chapter of Naples as teacher at Paris. Then follows a long period of which it is known only that he spent part of the time at Strasburg (cf. *Urkundenbuch der Stadt Strassburg*, iii. 236). A passage in a chronicle of the year 1320, extant in manuscript (cf. Preger, i. 352-399), speaks of a prior Eckhart at Frankfort who was suspected of heresy, and some have referred this to Meister Eckhart; but it is highly improbable that a man under suspicion of heresy would have been appointed teacher in one of the most famous schools of the order.

Eckhart next appears as teacher at Cologne, and the archbishop, Hermann von Virneburg, accused him of heresy before the pope. But Nicholas of Strasburg , to whom the pope had given the temporary charge of the Dominican monasteries in Germany, exonerated him. The archbishop, however, pressed his charoes ao-ainst Eckhart and against Nicholas before his own court. The former now denied the competency of the archiepiscopal inquisition and demanded *litterce dimissorix* (*apostoli*) for an appeal to the pope (cf. the document in Preger, i. 471; more accurately in *ALKG*, ii. 627 sqq.). On Feb. 13, 1327, he stated in his protest, which was read publicly, that he had always detested everything wrong, and should anything of the kind be found in his writings, he now retracts. Of the further progress of the case there is no information, except that John XXII. issued a bull (*In agro dominico*), Mar. 27, 1329, in which a series of statements from Eckhart is characterized as heretical; another as suspected of heresy (the bull is given complete in *ALKG*, ii. 636-640). At the close it is stated that Eckhart recanted before his death everything which he had falsely taught, by subjecting himself and his writing to the decision of the apostolic see. By this is no

doubt meant the statement of Feb. 13, 1327; and it may be inferred that Eckhart's death, concerning which no information exists, took place shortly after that event. In 1328 the general chapter of the order at Toulouse decided to proceed against preachers who "endeavor to preach subtle things which not only do (not) advance morals, but easily lead the people into error." Eckhart's disciples were admonished to be more cautious, but nevertheless they cherished the memory of their master.

WORKS. For centuries none of Eckhart's writings were known except a number of sermons, found in the old editions of Tauler's sermons, published by Kachelouen (Leipsic, 1498) and by Adam Petri (Basel, 1521 and 1522). In 1857 Franz Pfeiffer in the second volume of his *Deutsche Mystiker* (Stuttgart), which is wholly devoted to Eckhart, added considerable manuscript material. Pfeiffer was followed by others, especially Franz Jostes, *Meister Eckhart und seine Junger, ungedruckte Texte zur Geschichte der deutschen Mystik* (*Collectanea Friburgensia*, iv., Freiburg, 1895). But some pieces are of doubtful genuineness, and the tradition concerning others is very unsatisfactory. It was a great surprise when in 1880 and 1886 H. Denifle discovered at Erfurt and Cues two manuscripts with Latin works of Eckhart, the existence of which Nicholas of Cusa and Trittenheim had indeed mentioned, but which had since then been considered lost. There can be no doubt as to their genuineness, but thus far only the (comparatively extensive) specimens which Denifle had published (in *ALKG*, ii.) are known. The extant writings appear to be only parts of a very large work, the *Opus tripartitum*, which, to judge from the prologue in the first part treated of more than 1,000 propositions, in the second part debated a number of special questions, and in the third part, first expounded Biblical texts (*opus sermonum*) and afterward explained the books of the Bible in their order with special reference to the important passages. Entirely unknown at present are the contents of the more important manuscript of Cues, especially the exposition of the Gospel of John, which may contain information on many things.

VIEW OF GOD. As has already been stated it is impossible to give at present a final decision on Eckhart's world of ideas. Nevertheless an attempt may be made to delineate his fundamental thoughts, based upon the material at hand. The great need of man is that his soul be united with God; for this a knowledge of God and his relation to the world, a knowledge of the soul and the way which it must go, are necessary. Eckhart does not doubt that such knowledge is given in the traditional faith of the Church, but it is not sufficient for one who is longing for salvation. He must attain to it with his own understanding. Eckhart accordingly does not move and live in ecclesiastical tradition after the manner of Bernard of Clairvaux or Hugo of St. Victor; in his thinking on the highest questions he is independent and in this way he arrives at views which do not harmonize with the teaching of the Church, without, however, as far as can be seen, being conscious of any opposition. The last and highest object of thinking is the Deity, i.e. the divine entity as distinguished from the persons, yet Eckhart often uses "God" in the sense of "Deity," where his thought does not call for accurate definitions (but cf., on the other hand, 180, 14; 181, 7). The Deity is absolute being without distinction of place or manner (*ALKG*, ii. 439-440). No predicate derived from finite being is applicable to the Deity; but this is therefore not mere negation or emptiness. Rather is finite being, as such, negation; and the Deity, as the negation of finite being, is the negation of negation, i.e. the absolute fulness of being (322, 131 539, 10-27). Dionysius wrongly states: God is not, he is rather a nonentity. When in other passages (82, 26; 182, 31; 500, 27) Eckhart himself designates God as non-existent, he only means that he has none of the characteristics of finite existence. The same apparent contradiction is found, where Eckhart on the one hand calls God absolute being, and on the other denies that he is a being (319, 4; 659, 1); but he

reconciles the two views (268-269). The same is the case with occasional seemingly paradoxical expressions, e.g. that God is not good, etc. (269, 18; 318, 35-319, 3). The essential elements of finite things are present in God, but in an exalted degree and in a manner that can not be comprehended by man (322, 20; 540, 2-7).

TRINITARIAN PROCESS. The absolute, unqualified being of the Deity Eckhart also calls unnatured nature. This unnatured nature, however, manifests itself in the natured nature, the three persons. The Trinity is the self-revelation of the Deity (540, 31; 390,12-22). In it God comprises himself. Accordingly, Eckhart attributes to the Father a sort of genesis; only the Deity is absolutely without any progression and reposes everlastingly in itself. The Father was made through himself (534, 17). This self-revelation of God Eckhart designates as a cognition, a speaking, or a demeanor. The Father perceives the whole fulness of the Deity (6,S); or, what is the same, he speaks a single word, which comprises everything (70, 25). He procreates the Son (284, 12); for the Father is father only through the Son. The Son, however, is in everything like the Father, only that he procreates not,(337, 3). The essence of the Father is also that of the Son, and the essence in both is no other than that of the Deity. From the pleasure and love which both have for each other springs the Holy Ghost (497, 26). Eckhart leaves no doubt that the entire trinitarian process must not be conceived of as a temporal one, but as a process extending throughout eternity (254, 10). Preger thought that Eckhart's distinction between Deity and God should be interpreted as a distinction between potentiality and actuality. To this interpretation Denifle (*ALKG*, ii. 453 sqq.) has strongly objected and cited Eckhart's Latin writings, in which he, with Thomas Aquinas and others, designates God as *actus purus*, thus excluding all potentiality. Denifle is right, in that Eckhart does not consciously and deliberately make any such distinction; but it can not be denied that his conception leads to it. Especially significant is Eckhart's explanation in 175, 7 sqq. where he tries to illustrate the relation between the fatherhood as it is determined in the Deity and the paternity of the person of the Father by the relation between the maternity peculiar to the Virgin as such, and the maternity which she acquires by bearing. But this is exactly the relation of potentiality and actuality (cf. also the peculiar passage 193, 33). It must be admitted that Eckhart here expresses two views which can not be harmonized with one another, though the second is not fully developed. Eckhart had a wealth of ingenious ideas, but he was unable to systematize them.

GOD IN CREATION. The self-manifestation of God in the Trinity is followed by his manifestation in his creatures. Everything in them that is truly real is God's eternal being; but God's being does not manifest itself thus in its entire fulness (101, 34; 173, 26; 503, 26). In this antithesis may be expressed the relation of Eckhart's philosophy to pantheism, both as regards similarities and differences. According to Eckhart God's creatures have not, as Thomas Aquinas held, merely ideal preexistence in God, i.e. their conceptual essence (*essential quidditas*) coming from the divine intelligence, but their existence (*esse*) being foreign to the divine being. Rather is the true being of the creatures immanent in the divine being. On the other hand, every peculiarity distinguishing, creatures from each other is something negative; and in this sense it is said that the creatures are a mere nothing. Should God withdraw from his creatures his being, they would disappear as the shadow on the wall disappears when the wall is removed (31, 2). This perishable being is the creature confined within the limits of space and time (87, 49). On the other hand, every creature, considered according to its true entity, is eternal. It is obvious that this necessarily involves a modification of the idea of creation. Even Augustine and the Schoolmen felt this difficulty. While they did not, like Eckhart connect the existence of the world with the being of God they did consider it unallowable to attribute to God any temporary activity. Albert the Great tried to avoid

the difficulty with the sentence, "God created all things from eternity, but things were not created from eternity"; but this is more easily said than conceived. According to the bull of 1329 (p. 2), Eckhart asserted that "it may be conceded that the world was from eternity." It is impossible here to investigate this view further; but reference must be made to the close relation into which Eckhart brings the process of the Trinity and the genesis, or progress, of the world, both of the real and the ideal world (76, 52; 254, 16; 284, 12; cf. *Com. in Genes*., *ALKG*, ii. 553, 13-17).

RELATION OF THE SOUL TO GOD. The unqualified Deity, the Trinity (birth of the Son or of the Eternal 117ord), and the creation of the world are to him three immediate moments, which follow each other in conceptual, not temporal sequence. All creatures have part in the divine essence; but this is true of the soul in a higher degree. In the irrational creature there is something of God; but in the soul God is divine (230, 26; 2,31, 4). Though God speaks his word in all creatures, only rational creatures can preserve it (479, 19). In other words, in the soul, where he has his resting-place, God is subjective, while in the rest of creation he is merely objective. The soul is an image of God, in so far as its chief powers, memory, reason, and will, answer to the divine persons (319, 1). This accords with the view of Augustine. Just as there is the absolute Deity, which is superior to the persons of the Godhead, so in the soul there is something that is superior to its own powers. This is the innermost background of the soul, which Eckhart frequently calls a "spark," or "little spark." In its real nature this basis of the soul is one with the Deity (66, 2). When Eckhart sometimes speaks of it as uncreated (286, 16; 311, 6), and then again as created, this does not involve a contradiction. While, on the one hand, it rests eternally in the Deity, on the other it entered into the temporal existence of the soul, i.e. was made or created through grace. But it is not in this original unity with God that the soul finds its perfection and bliss. As it has a subjective being, it must turn to God, in order that the essential principle implanted in it may be truly realized. It is not enough that it was made by God; God must come and be in it. But this has taken place without hindrance only in the human soul of Christ (67, 12). For all other souls sin is an obstacle.

SIN AND REDEMPTION. But wherein does sin consist? Not in the finiteness, which is never removed from the soul (3S7, 3; 500, 1 1), but in the direction of the will toward the finite and its pleasure therein (476, 19; 674, 17). The possibility of sin, however, is based in finiteness, taken together with the free will of the creature. If it is the destiny of the soul to be the resting-place of God, then the direction of the will toward the finite makes this impossible; and it is this that constitutes sin. Redemption, therefore, can tale place only when the creature makes room in his soul for the work of God; and the condition for that is the turning away from the finite. For God is ever ready to work in the soul, provided he is not hindered and the soul is susceptible to his influence (27, 25; 283, 23; 33, 29; 479, 31). The inner separation from everything casual, sensual, earthly and the yielding to the work of God in the heart,-that is the seclusion or tranquillity of which Eckhart speaks again and again. For him this is the basis of all piety. But what is it that God accomplishes in the soul? This can be stated in a word: the birth of the son. As the soul is an image of the Deity, if it is to fulfil its destiny, then that process by which the deity develops into the three persons must take place in it. The father procreates in the soul the son (44, 28; 175, 15-20; 479, 10; 13, 12). This takes place during the life of the soul in time; and, too, not merely at a particular moment, but rather continuously and repeatedly. This is not merely a copy or analogon of that inner divine process, but is in truth that very process itself, by which it becomes, through grace, what the Son of God is by nature (433, 32; 382, 7; 377, 17). From this view of Eckhart's follow a number of the most strikino, statements in which the soul is made to share in the attributes and

works of God, including the creation (119, 28-40; 267, 4; 283, 37-284, 7). However, according to Eckhart, a complete fusion of the soul with the Deity never takes place (387, 3). He also opposes the doctrine of Apocatastasis (65, 20; 402, 34; 470, 22).

PLACE OF CHRIST. According to Eckhart sin is not the real cause of the incarnation (591, 34). God wished rather to receive the nature of things through grace in time just as he had them by nature in eternity in himself (574, 34). Just as a man occupies a central position in the world, since he leads all creatures back to God, so Christ stands in the center of humanity (180, 7; 390, 37.) The same thought is found in Maximus the Confessor and Erigena, but whence did Eckhart get it? Even at the creation of the first man Christ was already the end in view (250, 23); and now after the fact of sin, Christ stands likewise in the center of redemption. After the fall all creatures worked together to produce a man who should restore the harmony (497, 11). This took place when Mary resigned herself so completely to the divine word that the eternal word could assume human nature in her. However, this temporal birth of the son is again included in his eternal birth as a moment of the same (391, 20). And now God is to be born in us. In his human life Jesus becomes a pattern for man; and in all tl-iat he did and experienced, above all in his passion and death there is an overwhelming power that draws man to God (218-219) and brings about in us that which first took place in Christ, who alone is the way to the father (241, 17).

ETHICS. Whatever one may think of Eckhart's philosophical and dogmatic speculations, his ethical view, at any rate, is of rare purity and sublimity. The inner position of man, the disposition of the heart, is for him the main thing (56, 39; 297, 11; 444, S; 560, 43) and with him this is not a result of reflection. One feels that it comes from the core of his personality; and no doubt this was the principal reason for the deep impression his sermons made. He speaks little of church ceremonies. For him outward penances have only a limited value. That man inwardly turn to God and be led by him,-that is the main purpose of Eckhart's exhortations. Let no one think because this or that great saint has done and suffered many things, that he should imitate him. God gives to each his task, and leaves every one on his way (560 sqq. 177, 26-35). No one can express the fact more definitely than does Eckhart, that it is not works that justify man, but that man must first be righteous in order to do righteous works. Nor does he recommend that one flee from the world, but flee from oneself, from selfishness, and self-will. Otherwise one finds as little peace in the cell as outside of it. Though he sees in suffering the most effective and most valuable means of inner purification, still lie does not mean that one should seek sufferings of his own choosing, but only bear patiently whatever God imposes. He recognizes that it is natural for one to be affected either pleasantly or unpleasantly by the various sense-impressions; but in the innermost depths of the soul one must hold fast to God and allow himself to be moved by nothing (52, 1; 427, 22). It need hardly be added that he regards highly works of charity. Even supreme rapture should not prevent one from rendering a service to the poor. It is noteworthy that, in the ninth sermon, he puts Alartha, higher than Mary, though by a strange misinterpretation of the text. While Mary enjoyed only the sweetness of the Lord, being yet a learner, Martha had passed this stage. She stood firm in the substance, and no work hindered her, but every work helped her to blessedness. Future investigations will presumably make possible a more accurate estimate of the importance of Eckhart; but it is hardly possible that they will overthrow the verdict of Suso and Tauler concerning him.

The Internet Encyclopedia of Philosophy

Eclecticism

"Eclecticism" is a name given to a group of ancient philosophers who, from the existing philosophical beliefs, tried to select the doctrines that seemed to them most reasonable, and out of these constructed a new system (see Diogenes Laertius, 21). The name was first generally used in the first century BCE. Stoicism and Epicureanism had made the search for pure truth subordinate to the attainment of practical virtue and happiness. Skepticism had denied that pure truth was possible to discover. Eclecticism sought to reach by selection the highest possible degree of probability, in the despair of attaining to what is absolutely true. In Greek philosophy, the best known Eclectics were the Stoics Panaetius (150 BCE.) and Posidonius (75 BCE.). The New Academic, Carnaedes (155 BCE.), and Philo of Larissa (75 BCE.). Among the Romans, Cicero, whose cast of mind made him always doubtful and uncertain of his own attitude, was thoroughly eclectic, uniting the Peripatetic, Stoic, and New Academic doctrines, and seeking the probable (*illud probabile*). The same general line was followed by Varro, and in the next century the Stoic Seneca propounded a philosophical system largely based on eclecticism.

In the late period of Greek philosophy there appears an eclectic system consisting of a compromise between the Neo-Pythagoreans and the various Platonic sects. Still another school is that of Philo Iudaeus, who at Alexandria, in the first century CE. interpreted the Old Testament allegorically, and tried to harmonize it with selected doctrines of Greek philosophy. Neo-Platonism, the last product of Greek speculation, was also a fusion of Greek philosophy with eastern religion. Its chief representatives were Plotinus (230 CE.), Porphyrius (275 CE.), Iamblichus (300 CE.), and Proclus (450 CE.). The desire of this school was to attain right relations between God and humans, and was thus religious.

Egoism

In ethics egoism entails that the individual self is either the motivating moral force and is, or should, be the end of moral action.

Egoism divides into both a positive and normative ethic. The positive ethic views egoism as a factual description of human affairs, that is people are motivated by their own interests and desires. The normative ethic is that they should be so motivated.

Positivist egoism: Psychological Egoism

The positivist egoist, whose theory is called psychological egoism, offers an explanation of human affairs, in effect a description of human nature, which he or she believes to be wholly self-centred and self-motivated. In its strong form the theory asserts that people *always* act in their own interests, even though they may disguise their motivation with references to helping others or doing their duty.

Opponents exploit counter-factual evidence to criticize the theory-surely, they claim, there is a host of evidence supporting altruistic or duty-bound actions that cannot be said to engage the self-interest of the agent? Psychological egoists may then attempt to question the ultimate motive of acting benevolently towards others; they may retort that seemingly altruistic behavior necessarily has a self-interested component, that if the individual were not to offer aid to a stranger, he or she may feel guilty or may look bad in front of a peer group. At this point psychological egoism's validity turns on the question of moral motivation. But since motivation is inherently private (an agent could be lying to him or herself or to others about the original motive), the theory shifts from a theoretical description of human nature, one that can be put to observational testing, to an assumption about human nature. It moves beyond the possibility of empirical verification and the possibility of empirical negation (since motives are private), and therefore it becomes a closed theory. A closed theory is a theory that rejects competing theories on its own terms and is non-verifiable and non-falsifiable. If psychological egoism is reduced to an assumption concerning human nature, then it follows that it is just as valid to hold a competing theory of human motivation, psychological altruism for example. Psychological altruism holds that all human action is necessarily other centred and other motivated. A parallel analysis of psychological altruism results in opposing conclusions to psychological egoism, and again arguably the theory is just as closed as psychological egoism. If both theories can be validly maintained, it follows that the soundness of either or both must be questioned.

A weak version of psychological egoism accepts the possibility of altruistic or benevolent behavior, but maintains that whenever a choice is made it is by definition the action that the agent wants to do at that point. A wants to help the poor, therefore A is acting egoistically; if A ran into a burning building to save a kitten, it must be the case that A *wanted* to save the kitten. Defining all motivations as what the agent wants to do remains problematic: logically the theory becomes tautologous and therefore empty of providing a useful, descriptive meaning of motivation. It says that we are motivated to do what we are motivated to do. Besides which, if helping others is what A wants to do, then to what extent can A be continued to be called an egoist?

David Hume in his *Enquiry Concerning the Principles of Morals* (Appendix II-Of Self Love) offers six rebuttals of psychological egoism (the 'selfish hypothesis'). Firstly, it opposes such obvious moral sentiments that engage in a concern and motivation for others such as love, friendship, compassion, and gratitude. Secondly, psychological egoism attempts to reduce human motivation to a single cause, which is a 'fruitless' task-the "love of *simplicity*…has been the source of much false reasoning in philosophy." Thirdly, it is evident that animals act benevolently towards one another, and if it is admitted that animals can act altruistically then how can it be denied in humans? Fourthly, the

concepts we use to describe benevolent behavior cannot be meaningless; sometimes the agent obviously does not have a personal interest in the fortune of another, yet will wish him well. Any attempt to create an imaginary interest, as the psychological egoist attempts, will prove futile. Fifthly, Hume asserts that we have prior motivations to self-interest; we may have, for example, a predisposition towards vanity, fame, or vengeance that transcends any benefit to the agent. Finally, even if psychological egoism were true, there are a sufficient number of dispositions to generate a wide possibility of moral actions, allowing one person to be called vicious and another humane, and the latter is to be preferred over the former.

Normative Egoism-Rational Egoism

The second variant of egoism is normative in that it stipulates the agent ought to promote the self above other values. This theory does not attempt to describe human nature, but asserts how people ought to behave. It comes in two general forms: rational egoism and ethical egoism.

Rational egoism claims that the promotion of one's own interests is always in accordance with reason. In the strong version not only is it rational to pursue one's own interests, it is also irrational not to pursue them. In the weak version, it is rational to pursue one's own interests but there may be occasions when not pursuing them is not necessarily irrational.

A problem with rational egoism is that reason may dictate that one's own interests should not govern one's actions. At this point the possibility of conflicting reasons in a society need not be evoked, but it can be claimed that reason may invoke an impartiality clause, demanding that in a certain situation, one's interests should not be furthered. For example, consider a free-rider situation. In marking students' papers, a teacher may reasonably argue that to offer inflated grades is to make his life easier, for marking otherwise would incur negative feedback from students, having to spend time counselling on writing skills, etc.; it is even foreseeable that inflating grades may never have negative consequences, for he could free-ride on the tougher marking of the rest of the department or university and not worry about the negative consequences of a diminished reputation. However, impartiality considerations demand an alternative course-reasonably it is not right to change grades to make life easier. Here self-interest conflicts with reason.

In a different scenario, game theory points to a possible logical flaw in rational egoism by offering an example in which the pursuit of self-interest results in both agents being made worse off. This is famously described in the Prisoner's Dilemma.

		Prisoner B	
		Confess	Don't confess
Prisoner A	Confess	5,5	½,10
	Don't Confess	10,½	2,2

From the table, two suspects are individually offered different sentences. A, for example, is offered 5 years in prison if he confesses and is told that if his partner doesn't confess he will be given 6 months in jail and his partner 10 years. If he refuses to confess, then A faces 10 years in prison if his partner does confess, but both would only serve two years in prison if they both do not confess. The dominating pay-off strategy is for both to confess, whilst an agreement between A and B not to confess would result in the better solution for the two; however, the incentive is to squeal, in which case

both will serve the non-optimal solution of 5 years each.

Whilst the Prisoner's Dilemma offers a mathematical reason why self-interested action could lead to a socially non-optimal, and unstable, equilibrium, it can be countered that the nature of the game pre-empts other possibilities. The sentences are fixed, the choices are fixed; whilst this applies to the two prisoners, it is not obvious that every-day life generates such limited and limiting choices.

Normative Egoism: Ethical Egoism

Ethical egoism is the theory that the promotion of one's own good is in accordance with morality. In the strong version it is held that it is always moral to promote one's own good and it is never moral not to promote it. In the weak version, it claims that whilst it is always moral to promote one's good, it is not necessarily never moral not to do so-that is, there may be conditions in which the avoidance of personal interest may be a moral action.

In the imaginary construction of a world inhabited by a single being, it is possible that the pursuit of morality is the same as the pursuit of self-interest. What is good for the agent is the same as what is in the agent's interests. Arguably, there could never arise an occasion when the agent ought not to pursue self-interest in favor of another morality. Whilst it is possible for the creature to lament previous choices as not conducive to self-interest (enjoying the pleasures of swimming all day and not spending necessary time producing food), the mistake is not a moral mistake but a mistake of identifying self-interest. Presumably this lonely creature will begin to comprehend the distinctions between short and long run interests. However, it can be countered that in this world duties still apply; (Kantian) duties are those actions reason dictates ought to be pursued regardless of any gain or loss to the self or others. The deontologist asserts another moral sphere, namely impartial duties, which ought to be pursued. The problem with complicating the creature's world with duties, is defining an impartial task in a purely subjective world. Impartiality, it can be retorted, can only exist where there are competing selves, otherwise the attempt to be impartial in judging one's actions is a redundant exercise.

If we move away from the imaginary construct of a single being's world, ethical egoism comes under fire from more pertinent arguments. In complying with ethical egoism, the individual aims at his or her own greatest good. Ignoring a definition of the good for the present, it may justly be argued that pursuing one's own greatest good can conflict with another's pursuit, thus creating a situation of conflict. In a typical example, a young person may see his greatest good in murdering his rich uncle to inherit his millions. It is the rich uncle's greatest good to continue enjoying his money, as he sees fit. Accordingly conflict is an inherent problem of ethical egoism, and the model seemingly does not possess a conflict resolution system. With the additional premise of living in society, ethical egoism has much to respond to. Obviously there are situations when two people's greatest goods, their own self-interests, will conflict, and a solution to such dilemmas is a necessary element of any theory attempting to provide an ethical system.

The first resolution proceeds from a state of nature examination. If, in the wilderness, two people simultaneously come across the only source of drinkable water a dilemma arises if both make a claim to it. With no recourse to arbitration they must either accept an equal share of the water, which would comply with rational egoism (i.e., it is in the interests of both to share, for both may enjoy the water and each other's company, and if the water is inexhaustible, neither can gain from monopolising the source), but a critic can maintain that it is not necessarily in compliance with ethical egoism. Arguably, the critic continues, the two have no possible resolution and must therefore fight for the water. This is often the line taken against egoism, that it results in insoluble conflict that implies or necessitates a resort to force. The proffered resolution is therefore an acceptance of the might is right principle, that the stronger will take possession and thereby gains proprietary rights. But ethical egoism does not have to logically result in a Darwinian struggle between the strong and the weak; the two could co-operate (as rational egoism would require) and thereby both could mutually benefit. Against the critic's pessimism, the ethical egoist can retort that each can recognize that their greatest interests are served more through co-operation than conflict.

A second resolution to seemingly intractably moral dilemmas concerns the fears of critics that ethical egoists could logically pursue their interests at the cost of others. This however is a misreading of ethical egoism and an attempt to re-insert the might is right premise and thereby chastise the theory on the basis of a straw-man argument. In the case of the rich uncle and the greedy nephew, it is not the case that the nephew would act ethically by killing his uncle. The confusion results from conflating ethics with personal gain and criticising personal gain from another ethical standpoint that condemns murder. A counter-argument is that personal gain logically cannot be in one's best interests

if it entails doing harm to another: doing harm to another is to accept the principle of doing harm to others as being ethical (i.e., equating to one's own best interests), whereas reflection on the principle shows it to be illogical on universalist criteria. If the nephew were to attempt to do harm to further his interests, he would find that his uncle, or others, would do harm in return, and the argument returns to the conclusion of the first resolution: either accept the principle of might is right (which in most cases would be evidentially contrary to one's best interests) or accept that co-operation with others is a more successful approach to improving one's interests.

A third resolution entails the insertion of another standard-rights. This incorporates the conclusions of the first two resolutions by stating that there is an ethical framework that can logically be extrapolated from ethical egoism. Rights incorporate boundaries to behavior that reason or experience has shown to be contrary to the pursuit of self-interest. However, the logical extrapolation is the difficult bit. Whilst it is facile to argue that the greedy nephew does not have a right to claim his uncle's money, because it is not his but his uncle's, and that it is wrong to aggress against the person of another because that person has a legitimate right to live in peace (thus providing the substance of conflict-resolution for ethical egoism), the problem lies in the intellectual arguments required to substantiate the claims for the existence of rights and that they are somehow intricately connected to the pursuit of individual's greatest good.

Conditional Egoism

A final type of egoism is ethically conditional egoism, that is, egoism is morally acceptable or right if it leads to morally acceptable ends. For example, self-interested behavior can be accepted and applauded if it leads to the betterment of society as a whole; the ultimate test rests not on acting self-interestedly but on whether society is improved as a result. A famous example of this kind of thinking is from Adam Smith's *The Wealth of Nations*, in which Smith outlined the public benefits resulting from self-interested behavior (borrowing a theory from the earlier writer Bernard Mandeville and his *Fable of the Bees*). Smith wrote: "It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest. We address ourselves, not to their humanity but to their self-love, and never talk to them of our own necessities but of their advantages." *Wealth of Nations*, I.ii.2.

As Smith himself admits, if egoistic behavior lends itself to society's detriment then it ought to be stopped. The theory of conditional egoism is thus dependent on a superior moral goal such as being in the common interest, the public good.

To conclude, whilst psychological egoism is fraught with the logical problem of collapsing to a closed theory and hence being one assumption that could validly be accepted as describing human motivation and morality, normative egoist theories engage in a philosophically more intriguing dialogue with protractors. Having evaluated some the theories' merits and demerits, it must be remembered that egoism is one normative model; it is opposed by altruistic theories that claim other people's interests should count for more than the individual's, and deontological theories that claim that neither self-interest nor the interests of others should partake in moral discourse and action.

Emanation

DEFINITION AND DISTINCTIONS. The concept of emanation is that all derived or secondary things proceed or flow from the more primary. It is distinguished from the doctrine of creation by its elimination of a definite will in the first cause, from which all things are made to emanate according to natural laws and without conscious volition. It differs from the theory of formation at the hands of a supreme artisan who finds his matter ready to his hand, in teaching that all things, whether actually or only apparently material, flow from the primal principle. Unlike evolution, again, which includes the entire principle of the world, material and spiritual, in the process of development, emanation holds to the immutability of the first principle as to both quality and quantity, and also in the tendency of the development evolution implying one which goes from less to more perfect, while emanation involves a series of descending stages.

HINDU, ZOROASTRIAN, AND GREEK PHASES. In the Upanishads of the Veda several passages which point, if obscurely, to this doctrine. One frequently quoted passage asserts that "From this Atman originated space, and from space the wind, and from the wind the fire, and from fire water, and from water the earth, and from the earth plants, and from plants food, and from food the seed of man, and from the seed of man himself." This, however, does not clearly assert an emanation, but merely marks the stages of descent that separate man from the Atman. Attempts have often been made to derive the Gnostic doctrine of emanation from the Zoroastrian Avesta, but with doubtful success. Even if we may assume another higher power antecedent to the two hostile powers set forth in this dualistic system and comprising them both, still the independence of these two, as well as of the angels or half-divine beings who surround them, is not clearly asserted as owing to their emanation from the primal principle. In the ancient Egyptian religion, in which polytheism early appeared, there is no question of either emanation or evolution. In Greek philosophy emanations (aporrhoiai) occur at an early period, as in Empedocles, who accounts for sensual perceptions as emanations or effluxes proceeding from the objects perceived. Similarly Democritus spoke of effluxes of atoms from the thing perceived, by which images (eidola) are produced, which strike our senses. But these views do not come under the general head of emanation, since they do not touch the origin of the atoms. Nor does the teaching of the Hylozoists, like Heraclitus, with his doctrine of the transformation of all things into fire, and then of fire into all other things. The same is true of the Stoics; some of the later ones, like Marcus Aurelius, speak of the soul as an aporrhoia of God, but this means a part of God, not an emanation from an undiminished source. The first real mention of the doctrine in Greek or Hellenistic philosophy is in the Wisdom of Solomon, where wisdom is described as " the breath of the power of God, and a pure influence (aporrhoia) flowing from the glory of the Almighty." These and the following expressions may, indeed, be poetical, not involving a personification of wisdom apart from the Godhead; but the way in which wisdom is spoken of throughout the book makes for the conception of an independent cosmic power which is an efflux from the Godhead.

PHILO AND EARLY CHRISTIAN DOCTRINE. The doctrine of emanation is a little more

explicit in Philo, though he does not teach it clearly and consciously, still less purely and logically. It assumes its most definite form for Greek philosophy in the works of the Neoplatonists -- though their speculations are largely derived from the Gnostic mythological systems of Basilides and Valentinus, in which emanation played a prominent part. According to Basilides, a whole series of eons emanated in successive stages from the unbegotten Father; and the Valentinians spoke of the primal essence as "throwing off " (*proballein*), without diminution, that which was derived from it. In the Neoplatonist system, the highest principle, the One, overflows without a conscious act, merely by a law of its nature, losing nothing of its fullness and this process has no end in time. It goes from more perfect to less perfect, and the ineffable Unity is the source of all plurality. The *Nous* (intellect), the first stage in the process, thinks, and thus from it emanate the soul and the *logos* (word). So the process goes on until the lowest stage is reached in essenceless matter. The notion of emanation was frequently used by the early Christian writers in the attempt to express the relation of the Son and the Holy Spirit to the Father. The idea is similarly used by Athenagoras, Origen, and Arnobius- Tertullian even ventures to employ the Valentinian term *probola* for the relation of the Son to the Father, while repudiating the separation which Valentinus had taught between his eons. In the final establishment of the Trinitarian doctrine the idea of emanation undoubtedly played a part, as in the emphasis laid upon the Son's being " begotten, not made " (Nicene Creed), and the " procession" of the Holy Ghost; but the idea of descent to imperfection is lacking.

PSEUDO DIONYSIUS, SCHOLASTIC, AND MYSTIC DOCTRINE. A common misunderstanding regards Dionysius the Areopagite as of importance in the history of the doctrine of emanation. He does teach an efflux from God; but the heavenly hierarchy, with its various grades of perfection, does not arise by an emanation of one from the other; all have their origin directly from God, or the Highest Good. Erigena, referring much of his doctrine to Dionysius, makes use of a kind of creation which resembles the Neoplatonist emanation. His world of *causoe primordiales* is eternal, though not with God's eternity, but eternally created by or proceeding from God. Creation is a process through these to the visible and invisible creatures; it too is eternal; God is in the creation, and the creation in God. From Erigena the custom passed over to scholasticism of considering creation as a sort of emanation; but in the passage of Thomas Aquinas most frequently quoted in this connection (I., qu. xlv., art. 1) the specific character of emanation is so weakened as to be perceptible only in the fact that he does not draw a sharp dividing line between God and his powers and the world. In the mystics, despite their connection with scholasticism, the doctrine of emanation can scarcely be discovered in its pure form. But in the Jewish Cabala the emanationistic origin of the world is distinctly taught; the connection with Christian Gnosticism, with the Neoplatonists, and with Dionysius is evident. With the founders of modern metaphysics, Descartes and Spinoza, emanation plays no prominent part; but the logicians of the sixteenth and seventeenth centuries make use of the term *causa emanative* in contradistinction to *causa activa*. It is also found in Leibniz's conception of the relation between God and single monads; God is the primal unity, the monas primitive, which produces the created and derived monads.

IEP

The Internet Encyclopedia of Philosophy

Empedocles (fl. 450 BCE.)

LIFE. Empedocles was a citizen of Agrigentum in Sicily. His date is roughly fixed for us by the well-attested fact that he went to Thourioi shortly after its foundation in 444/3 BCE. He was, therefore, contemporary with the meridian splendor of the Periclean age at Athens, and he must have met Herodotus and Protagoras at Thourioi. He was distinguished not only as a philosopher, but also for his knowledge of natural history and medicine, and as a poet and statesman. After the death of his father Meto, who was a wealthy citizen of Agrigentum, he acquired great weight among his fellow-citizens by espousing the popular party and favoring democratic measures. His consequence in the State became at length so great that he ventured to assume several of the distinctions of royalty, particularly a purple robe, a golden girdle, a Delphic crown, and a train of attendants. He combined scientific study with a mystical religion of the Orphic type, but he differed from Pythagoras in the direction his scientific inquires took, focusing on medicine, rather than mathematics. That accounts for the physiological interest that arks his speculations. The skill which he possessed in medicine and natural philosophy allowed him to perform many wonders, which he passed upon the multitude for miracles. He pretended to drive away noxious winds from his country and thereby put a stop to epidemic diseases. He is said to have checked, by the power of music, the madness of a young man who was threatening his enemy with instant death; to have restored a woman to life who had lain breathless thirty days; and to have done many other things, equally astonishing, after the manner of Pythagoras. Because of all this he was an object of universal admiration. Besides medical skill Empedocles possessed poetical talents. The fragments of his verses are scattered throughout the ancient writers; and Fabricius is of opinion that he was the real author of those ancient fragments which bear the name of the "Golden Verses of Pythagoras," and may be found printed at the end of Gottling's edition of Hesiod. His principal works were a didactic poem on Nature (Peri Phuseos), and another entitled Katharmoi, which seems to have recommended virtuous conduct as a means of averting disease. Gorgias of Leontini, the well-known orator, known as the "the Nihilist," was his pupil, from where it may seem reasonable to infer that Empedocles was a master of the art of eloquence. According to the common account he threw himself into the burning crater of Aetna, in order that the manner of his death might not be known, and that he might afterwards pass for a god; but the secret was discovered by means of one of his brazen sandals, which was thrown out from the mountain in a subsequent eruption of the volcano. This story is rejected, however, as fictitious by Strabo and other writers. According to Aristotle he died at sixty years of age.

PHILOSOPHY. His views in philosophy are variously given. By some he is called a Pythagorean, in consequence of a resemblance of doctrine in a few unessential points. But the principles of his theory evidently show that he belongs to the Eleatic School. He unreservedly accepts the doctrine of Parmenides that *what is* is uncreated and indestructible, and he only escapes from the further conclusions of the Eleatic by introducing the theory of elements or *roots*. Of these he assumed four -- fire, air, earth, and water, -- and in some respects this was a return to primitive views which the

Milesians had already left behind them. It must be noticed, however, that Empedocles discovered that what we call atmospheric air was a body, and was quite distinct from empty space on the one hand or from vapor or mist on the other. This he did by means of an experiment with the water-clock. He showed that air could keep water out of a vessel, and that the water could only enter as the air escaped.

Besides these four 'roots', Empedocles postulated something called *Love* (philia) to explain the attraction of different forms of matter, and of something called *Strife* (neikos) to account for their separation. He speaks of these quite distinctly as bodies. We start with something like the sphere of Parmenides, in which the four elements are mingled in a sort of solution by Love, while Strife surrounds the sphere on the outside. When Strife begins to enter the Sphere, Love is driven towards its center, and the four elements are gradually separated from one another. That is clearly an adaptation of the old idea of the world breathing. Empedocles also held, however, that respiration depended on the systole and diastole of the heart, and therefore we find that, as soon as Strife has penetrated to the lowest (or most central) part of the sphere, and Love is confined to the very middle of it, the reverse process begins. Love expands and Strife is driven outwards, passing out of the Sphere once more in proportion as Love occupies more and more of it. In fact, Love and Strife are to the world what blood and air are to the body.

Empedocles taught that originally All was one, a God eternal and at rest; a sphere and a mixture (sphairos, migma), without a vacuum, in which the elements of things were held together in indistinguishable confusion by love, the primal force which unites the like to like. In a portion of this whole, however, or, as he expresses it, in the members of the Deity, strife, the force which binds like to unlike, prevailed, and gave the elements a tendency to separate themselves, whereby the first became perceptible as such, although the separation was not so complete but that each contained portions of the others. Hence arose the multiplicity of things. The origin of organic life was ascribed to the increasing action of Strife. At the beginning of this world there were undifferentiated living masses, which were gradually differentiated, the fittest surviving. Empedocles also described how mortal beings arose in the period when Love was gaining the master, and when everything happened in just the opposite way to what we see in our world. In that case, the limbs and organs first arose in separation, and were then joined together at haphazard, so that monsters were produced, 'oxen with heads of men and men with heads of oxen.' This strange picture of a reversed evolution may possible have been suggested by the Egyptian monuments. But, as the forces of love and hate are constantly acting upon each other for generation or destruction, the present condition of things cannot persist forever, and the world which, properly, is not the All, but only the ordered part of it, will again be reduced to a chaotic unity, out of which a new system will be formed, and so on forever. There is no real destruction of anything, but only a change of combinations.

A world of perishable things such as we know can only exist when both Love and Strife are in the world. There will, therefore, be two births and two passings away of mortal things, one when Love is increasing and all the elements are coming together into one, the other when Strife is re-entering the Sphere and the elements are being separated once more. The elements alone are everlasting; the particular things we know are unstable compounds, which come into being as the elements 'run through one another' in one direction or another. They are mortal or perishable just because they have no substance of their own; only the 'four roots' have that. There is, therefore, no end to their death and destruction. Their birth is a mixture and their death is but the separation of what has been mixed. Nothing is imperishable but fire, air, earth and water, with the two forces of Love and

Strife.

Of the elements (which he seems to have been the first to describe as four distinct species of matter), fire, as the rarest and most powerful, he held to be the chief, and consequently, the soul of all sentient and intellectual beings which issue from the central fire, or soul of the world. The soul migrates through animal and vegetable bodies in atonement for some guilt committed in its disembodied state when it is a demon, of which he supposed that an infinite number existed. The seat of a demon, when in a human body, is the blood. Closely connected with this view of the objects of knowledge was his theory of human knowledge. In the impure separation of the elements it is only the predominant one that the senses can apprehend; and, consequently, though man can know all the elements of the whole singly, he is unable to see them in their perfect unity, wherein consists their truth. Empedocles therefore rejects the testimony of the sensed, and maintains that pure intellect alone can arrive at a knowledge of the truth. This is the attribute of the Deity, for man cannot overlook the work of love in all its extent; and the true unity is open only to itself. Hence he was led to distinguish between the world as presented to our senses (kosmos aisthetos) and its type, the intellectual world (kosmos noetos). Lucretius, who praises Empedocles highly even while criticizing his philosophy, appears to have taken him as a model. (Cf. Lucret. i. 716 foll.).

We have little information as to how Empedocles explained the constitution of particular things. He regarded the four elements, which could be combined in an indefinite number of portions, as adequate to explain them all, and he referred in this connection to the great variety painters can produce with only four pigments. He saw, however, that some combinations are possible, while others are not. Water mixes easily with wine, but not with oil.

IEP

British Empiricism

"British Empiricism" refers to the 18th century philosophical movement in Great Britain which maintained that all knowledge comes from experience. Continental Rationalists maintained that knowledge comes from foundational concepts known intuitively through reason, such as innate ideas. Other concepts are then deductively drawn from these. British Empiricists staunchly rejected the theory of innate ideas and argued that knowledge is based on both sense experience and internal mental experiences, such as emotions and self-reflection. 18th century British Empiricists took their cue from Francis Bacon who, in the very first aphorism of his New Organon, hails the primacy of experience, particularly the observation of nature:

> Humans, who are the servants and interpreters of nature, can act and understand no further than they have observed in either the operation or the contemplation of the method and order of nature.

Although British Empiricists disavowed innate ideas, in favor of ideas from experience, it is important to note that the Empiricists did not reject the notion of instinct or innateness in general. Indeed, we have inborn propensities which regulate our bodily functions, produce emotions, and even direct our thinking. What Empiricists deny, though, is that we are born with detailed, picture-like, concepts of God, causality, and even mathematics.

Like Bacon, British Empiricists also moved away from deductive proofs and used an inductive method of arguing which was more conducive to the data of experience. In spite of their advocacy of inductive argumentation, though, British Empiricists still made wide use of deductive arguments. Commenting on the use of induction in the history of philosophy, 19th century Scottish philosopher James McCosh argues that induction is more representative of later Scottish philosophy than it is of earlier British Empiricism, specifically that of Locke:

> It cannot be denied that Locke does proceed very largely in the way of observation; but it is a curious circumstance that he nowhere professes to follow the method of induction; and his great work may be summarily represented as an attempt to establish by internal facts the preconceived theory, that all our ideas are derived from sensation and reflection. To the Scottish school belongs the merit of being the first, avowedly and knowingly, to follow the inductive method, and to employ it systematically in psychological investigation.

Three principal philosophers are associated with British Empiricism: John Locke, George Berkeley, and David Hume. Occasionally 19th century philosopher J.S. Mill is added to this list. But even restricting the British Empiricist movement to the above figures is somewhat misleading. Until the rise of English idealism around 1850, all British philosophy after Locke bears the marks of his empiricism. More than any other philosopher, Locke was cited as an authority by philosophers, philosophical theologians, and political thinkers. Indeed, the lengthy article on

"metaphysics" in the first edition of the *Encyclopedia Britannica* (1773) is essentially a summary of Locke.

Encyclopedists

"Encyclopedists" is the name usually applied to the group of French philosophers and men of letters who collaborated in the production of the famous *Encyclopedie*, or were in sympathy with its principles. The work was planned by Denis Diderot, and was announced as a *Dictionnaire raisonne des sciences, des arts, et des metiers*. The intention was to provide a complete alphabetical treatment of the whole field of human knowledge from the standpoint of the "Enlightenment". The contributors included a number of remarkable men. First in importance, acting with Diderot on equal terms, was D'Alembert. A large part of the work was done by the Chevalier de Jaucourt, a man of encyclopedic learning. When he died in 1755, Montesquieu left behind an unfinished article on "Taste." Voltaire wrote some articles, and constantly advised on the development of the plan. Roussear contributed articles on music, but ultimately quarreled with the editors, whose plan was so different from his. Turgot wrote on economic subjects, and in the latter part of the work Haller, the physiologist, and Conddorcet were engaged.

The first volume appeared in 1751, the second in the following January, and immediately excited the antagonism of the Church and the conservatives. On February 12, 1752, the two volumes were suppressed by the Council, as containing maxims contrary to royal authority and to religion. Further publication was suspended for eighteen months, but from 1753 to 1757 it went on without interruption. After the seventh volume, the forces of conservatism rallied to a fresh attack. The sale of the volumes already printed; as well as the printing of any more, was forbidden. Diderot, however, made his plans to continue privately to prepare the remaining volumes. D'Alembert withdrew, but Diderot toiled on and completed the work (28 volumes, Paris, 1751-72). Andre Franois Lebreton acquired a large interest in the undertaking and all the contributions were set up as they were written, but when Diderot had corrected the last proof, Lebreton and his foreman, without informing his partners, secretly cut out such parts from each articles as he thought too radical or likely to give offense. In this way many of the best articles were mutilated, and to prevent the restoration of the eliminated matter, Lebreton burned the original manuscripts. Subsequently a supplement was published (5 volumes, Amsterdam, Paris, 1776-77), also an index (2 volumes, 17880).

The *Encyclopedie* was both a repository of information and a polemical arsenal. It was an idea of the editors that if civilization should by entirely destroyed, mankind might turn to their volumes to learn to reconstruct it. No other collection of general information so large and so useful was then in existence. Yet mere learning was not what lay nearest to the hearts of Diderot and his fellows; the prided themselves even more on the firm and bold philosophy of some of the writers. The metaphysics is founded chiefly on Locke, who "may be said to have created metaphysics as Newton created physics," by reducing the science to "what in fact should be the experimental physics of the soul." Beyond this there is little unity of opinion, though the same spirit rules throughout. It includes a prejudice in favor of democracy, as the ideal form of government, and the worship of theoretical equality, but contempt for the populace, "which discern"; the reduction of religion to

sentiments of morality and benevolence, and great dislike for its minister, especially the religious orders. By its generous professions of philosophic tolerance, and apparent acquiescence in what for the moment it was too weak to overpower, the philosophic school won a hearing for doctrines which were essentially subversive of the established order of things in both Church and State, and prepared the way for overt revolution.

Environmental Ethics

Environmental ethics is a topic of applied ethics which examines the moral basis of environmental responsibility. In these environmentally conscious times, virtually everyone agrees that we need to be environmentally responsible. Toxic waste contaminates ground water, oil spills destroy shore lines, fossil fuels produce carbon dioxide thus adding to the greenhouse effect, and use of fluorocarbon gasses depletes the earth's protecting ozone layer. The goal of environmental ethics, then, is not to convince us that we should be concerned about the environment -- most of us already are. Instead, environmental ethics focuses on the moral foundation of environmental responsibility, and how far this responsibility extends. There are three distinct theories of moral responsibility to the environment. Although each supports environmental responsibility, their approaches are radically different.

The first of these theories is anthropocentric, or human centered. Environmental anthropocentrism is the view that all environmental responsibility is derived from human interests alone. The assumption here is that only human beings are morally significant persons and have a direct moral standing. Since the environment is crucial to human well-being and human survival, then we have an indirect duty towards the environment, that is, a duty which is derived from human interests. This involves the duty to assure that the earth remains environmentally hospitable for supporting human life, and that its beauty and resources are preserved so human life on earth continues to be pleasant. Some have argued that our indirect environmental duties derive both from the immediate benefit which living people receive from the environment, and the benefit that future generations of people will receive. But, critics have maintained that since future generations of people do not yet exist, then, strictly speaking, they cannot have rights any more than a dead person can have rights. Nevertheless, both parties to this dispute acknowledge that environmental concern derives solely from human interests.

A second general approach to environmental responsibility is an extension of the strong animal rights view discussed in the previous section. If at least some animals qualify as morally significant persons, then our responsibility toward the environment also hinges on the environmental interests of these animals. On this view, then, environmental responsibility derives from the interest of all morally significant persons, which includes both humans and at least some animals. Like anthropocentrism, though, environmental obligation is still indirect. The third and most radical approach to environmental responsibility, called eco-centrism, maintains that the environment deserves direct moral consideration, and not one which is merely derived from human (and animal) interests. The terminology used in the literature to express this direct responsibility is varied. It is suggested that the environment has direct rights, that it qualifies for moral personhood, that it is deserving of a direct duty, and that it has inherent worth. Common to all of these claims is the position that the environment by itself is on a moral par with humans.

LEOPOLD'S ECOCENTRISM. The position of ecocentrism is the view advocated by Aldo

Leopold in his highly influential essay "The Land Ethic" (1949), Leopold begins his essay explaining that morality has evolved over the millennia. The earliest notions of morality regulated conduct between individuals, as reflected in the Ten Commandments. Later notions regulated conduct between an individual and society, as reflected in the Golden Rule. Leopold argues that we are on the brink of a new advancement in morality which regulates conduct between humans and the environment, which he calls the land ethic. For all three of these phases in the evolution of ethics, the main premise of morality is that the individual is a member of a community of interdependent parts. For Leopold, "The land ethic simply enlarges the boundaries of the community to include soils, waters, plants, and animals, or collectively: the land." This involves a radical shift in how humans perceive themselves in relation to the environment. Originally we saw ourselves as conquerors of the land. Now we need to see ourselves as members of a community which also includes the land. The role of conqueror is self-defeating, for it assumes that the conqueror knows all. Yet, clearly, we do not know all of the inner complexities of the environment. Leopold illustrates this by noting how human history has been altered by specific changes we have imposed on the environment.

Leopold attacks the current attitudes about environmental responsibility. One approach is that of current conservation education. For Leopold, this is merely a propaganda campaign which ultimately supports the position that environmental responsibility should be guided by what is financially beneficial for individual farmers and land owners. He provides an example of this from his own state of Wisconsin. What is needed, Leopold argues, is the development of an ecological conscience which will give rise to a land ethic. The main problem with economic-based approaches is that most species have no economic value. In the past, conservationists would invent economic values for specific plants or animals so that they would be given consideration. In spite of the good intentions of these conservationists, Leopold argues, this completely misses the point since these species deserve consideration "as a matter of biotic right." It also does not address the problem to simply make it the government's responsibility to protect these species. For, many of these ecosystems are in private lands which the government cannot control.

To help us develop a proper ecological conscience, Leopold argues that we need a specific mental image to focus on. He offers the image of the land pyramid. The land pyramid is the class of all food chains, where the higher levels depend on everything beneath it. From bottom to top, the basic layers of the pyramid are those of soil, plants, insects, insect eating animals, omnivores, and carnivores. Humans fall into the omnivore category along with raccoons and bears. Leopold explains that there is a continuous and upward flow of food energy in the pyramid, and that obstructions to the flow of energy at any level will damage the whole. Some geographical regions of the world, such as Europe and Japan, have been able to sustain human imposed environmental changes without damage. But other regions of the world have been less fortunate.

Leopold argues that in all areas of environmental conservation (forestry, wildlife, and agriculture) two distinct mindsets will become apparent. Some will see the land in terms of commodity production, which perpetuates the role of humans as conquerors. However, others will understand the land more broadly, where humans are but citizens of the land. The greatest obstacle toward achieving a land ethic, then, is the economic mindset. Leopold concludes by offering a principle which brings into focus the broader ethical concerns of the environment: "A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."

PROBLEMS WITH ECOCENTRISM. Although ecocentrism is bold and even inspirational in its

advocacy of environmental obligation, it is open to several criticisms, both in its consequentialist and nonconsequentialist formulations. Leopold's principle (in the previous paragraph) is a consequentialist formulation since the rightness of an action depends on how its consequences benefit the environment. However, as an act-consequentialist moral principle it must be rejected since it will not give rise to traditional rules of morality (such as prohibitions against stealing). It also fails as a rule-consequentialist principle since some traditional moral rules (such as those against stealing) may be logically inconsistent with the ultimate goal of environmental well-being. Thus, eco-centrism will only make sense as a non-consequentialist principle, particularly as a prima facie duty-based principle.

The challenge of duty-based eco-centrism, though, is to explain how conflicts are to be resolved between human-centered duties, and environment-centered duties. Different principles of resolution have been offered. Callicott suggests that, in cases of conflict, human-centered duties will always have priority over environment-centered duties. But his solution fails since many environment-centered duties actually outweigh human-centered duties. Heffernan suggests that, in principle, survival interests of humans outweigh non-survival interests of the environment. This fails, though, since counter examples illustrate that some non-survival human interests outweigh the survival interests of minor ecosystems. An adequate duty-based approach to environmental obligation requires prioritizing environmental duties according to a ranked importance of the various ecosystems in question. Conflicts between prioritized environmental and human duties, then, can only be resolved on a case by case basis. This, it seems, is the only version of normative eco-centrism which is even plausible.

However, at this stage eco-centrism is irrelevant to the entire normative process. For, the eco-centric and anthropocentric approaches will produce exactly the same list of prioritized environmental duties, and will resolve duties between human-centered and environment-centered duties with exactly the same outcome. Although eco-centrism fails as a normative theory, eco-centrism may have merit as a way of expressing emotional outrage at environmental damage and demanding change.

Epictetus (c.55-c.135 CE.)

Epictetus was an eminent Stoic philosopher, born as a slave at Hieropolis in Phyrgia in 55 CE. The names of his parents are unknown; neither do we know how he was brought to Rome. But in Rome he was for some time a slave to Epaphroditus, a freedman of Nero, who had been one of his body-guards. Origen relates an anecdote about Epictetus which, if true, illustrates the fortitude of Epictetus, and also that Epaphroditus was a most cruel master. Epictetus, when his master was twisting his leg one day, smiled and quietly said, "You will break it"; and when he did break it, only observed, "Did I not tell you that you would do so?" It is not known how or when Epictetus managed to gain his freedom, but he could not have been still a slave when he left Rome because of an edict against philosophers at that time. This event, the only one in his life the date of which can be assigned, is said to have taken place in 89 CE., in the eighth year of Domitian's reign. Epictetus then retired to Nicopolis in Epirus, and it is a question whether he ever returned to Rome. The chief ground for believing that he did is a statement of Spartianus (*Hadr.*16), that Epictetus lived on terms of intimacy with the emperor Hadrian. It is true that his discourses contain frequent references to Nicopolis, and no internal evidence that they were delivered in Rome. However, this is not sufficient to overthrow the testimony of Spartianus. It is not known when he died. Suidas says that he lived till the reign of Marcus Aurelius, yet the authority or Aulus Gellius is strong on the other side. He, writing during the reign of the first Antonine, speaks of Epictetus, in two places, as being dead (*Noct. Att.* ii. 8; xvii. 19).

Epictetus led a life of exemplary contentment, simplicity, and virtue, practicing the morality which he taught. He lived in a small hut for a long while, with no other furniture than a bed and a lamp, and without an attendant. He benevolently adopted a child whom a friend had been compelled by poverty to give up; he also hired a nurse to look after the child. Epictetus was the most dominant teacher of Stoicism during the period of the Roman Empire. His lessons were principally, if not solely, directed to practical morality. His favorite maxim, and that into which he resolved all practical morality, was "bear and forbear," (*anexou kai apexou*). He appears to have differed from the Stoics on the subject of suicide, which he condemned. We are told by Arrian, in his Preface to the *Discourses*, that he was a powerful and inspiring lecturer; and, according to Origen (*c. Cels.* 7,*ad. init.*), his style was superior to that of Plato. It is a proof of the estimation in which Epictetus was held, that on his death, his lamp was purchased by an admirer for 3000 drachmas (several thousand dollars by today's standards). Though it is said by Suidas that Epictetus wrote much, there is good reason to believe that he himself wrote nothing. His *Discourses* were taken down by his pupil Arrian, and published after his death in eight books, of which four remain. Arrian also compiled the *Euchiridion* or "manual," an abstract of the teaching of his master, and wrote a life of Epictetus, which is lost. Some fragments have been preserved, however, by Stobaeus. Simplicius has also left an eclectic commentary on his doctrine.

Epicurus (342-270 BCE.)

LIFE. Epicurus was born in the year 342 BCE. on the island of Samos, to where father had gone from Athens, in 352 BCE., among 2000 colonists then sent out by the Athenians. Yet he was an Athenian by right, belonging to the deme Gargettus and to the tribe Aegels. His father Neocles is said to have been a school-master, and his mother Chaeristrata to have practiced arts of magic, in which it was afterwards made a charge against Epicurus that, when he was young, he assisted her (Diog. Lagrt. x. 4). Having passed his early years in Samoa and Teos, he went to Athens at the age of eighteen. He had begun to study philosophy when only fourteen, from a desire to understand Hesiod's description of chaos, which the teachers to whom he had applied had failed to satisfy. In Samos he is said to have received lessons from Pamphilus, a follower of Plato (Cic. N. D. i. 26). On the occasion of this his first visit to Athens, Epicurus stayed there for a very short time. He left it in consequence of the measures taken by Perdiccas after the death of Alexander the Great, and went to Colophon to join his father. In 310 BCE., he went to Mitylene, where he set up a school. Staying only one year at this latter place, he next proceeded to Lampsacus, where he taught for four years. He returned to Athens in the year 306 BCE., and now founded the school which ever after was named from him the Epicurean. He purchased a garden (*Khpoi Epikoupou*) for eighty miuae (about $1450), in which he lived with his disciples and deliver his lectures, and henceforth remained in Athens, with the exception only of two or three visits to his friends in Asia Minor.

The period at which Epicurus opened his school was peculiarly favorable. In place of the simplicity of the Socratic doctrine, nothing now remained but the subtlety and affectation of Stoicism, the unnatural severity of the Cynics, or the debasing doctrine of indulgence taught and practiced by the followers of Aristippus. Hence the popularity of his school. Epicurus is said by Diogenes Laertius (x. 9) to have had so many pupils that even whole cities could not contain them. Hearers came to him from distant places; and while men often deserted other schools to join that of Epicurus, there were only two instances, at most, of Epicurus being deserted for any other teacher. Epicurus and his pupils lived together in the garden of which we have spoken, in a state of friendship, which, as it is usually represented, could not be surpassed. They did not put their property together since such a plan implied mutual distrust. The friendship subsisting between Epicurus and his pupils is commemorated by Cicero (De Fin. i. 20). In this garden, too, they lived in the most frugal and decorous manner though it was the delight of the enemies of Epicurus to represent it differently, and though Timocrates, who had once been his pupil and had abandoned him, spread such gossip as that Epicurus used to vomit twice a day after a excessive eating and that prostitutes were inmates of the garden. An inscription over the gate of the garden told him who might be disposed to enter that barley cakes and water would be the fare provided for him (Sen. Ep. 31); and such was the chastity of Epicurus that one of his principal opponents, Chrysippus, endeavored to account for it, so as to deny him any merit, by saying that he was without passions (Stob. Serm. 117). Epicurus remained unmarried, in order that he might be able to prosecute philosophy without interruption. His most attached friends and pupils were Herniachus of

Mitylene, whom he appointed by will to succeed him as master of the school; Metrodorus, who wrote several books in defense of his system; and polyaenus. Epicurus' three brothers, Neocles, Chaeredemus, and Aristobulus, also followed his philosophy, as also one of his servants, Mys, whom at his death be made free. Besides the garden in Athens, from which the followers of Epicurus, in succeeding time, came to be named "the philosophers of the garden " (Juiv. Sat. xiii. 122; xiv. 319), Epicurus possessed a house in Melite, a village near Athens, to which be used often to retire with his friends. He died from a stone in the bladder in 270 BCE, at the age of 72, and had then been settled in Athens as a teacher for thirty-six years.

On his death be left this house, together with the garden, to Hermachus, as head of the school, to be left by him again to whoever might be his successor. The Epicurean school was carried on, after Hermachus, by Polystratus and many others, concerning whom nothing is known; and the doctrines which Epicurus had taught underwent few modifications. When introduced among the Romans, these doctrines, though very much opposed at first, were yet adopted by many distinguished men, as Lucretius, Atticus, and Horace. Under the emperors, Pliny the Younger and Lucian of Sainosata were noted Epictireaus.

Our chief sources of information respecting the doctrines of Epicurus are the tenth book of Diogenes Laertius and the poem of Lucretius, De Berunt Natura. Information is also furnished by the writings of Cicero, especially the De Finibus and the De Natura Deorum; by those of Seneca, and by the treatise of Plutarch, "Against Colotes." Epicurus, according to Diogenes Laertius, was a more voluminous writer having written as many as 300 volumes, in all of which he is said to have studiously avoided making quotations. All that now remains of his works are the philosophical letters and principal doctrines contained in the tenth book of Diogenes Laertius, and parts of two books of his treatise on Nature which were discovered at Herculaneum.

PHYSICS AND ETHICS. In physics Epicurus trod pretty closely in the footsteps of Democritus; so much so, indeed, that he was accused of taking his atomic cosmology from that philosopher without acknowledgment. He made very few unimportant alterations. According to Epicurus, as also to Democritus and Leucippus before him, the universe consists of two parts, matter (*soma*) and space, or vacuum (*to kenon*), in which matter exists and moves; and all matter, of every kind and form, is reducible to certain indivisible particles or atoms (*atomoi*), which are eternal. These atoms, moving, according to a natural tendency, straight downward, and also obliquely, have thereby come to form the different bodies which are found in the world, and which differ in kind and shape, according as the atoms are differently placed in respect to one another. It is clear that, in this system, a creator is dispensed with; and indeed Epicurus, here again following Democritus, set about to prove, in an a priori way, that this creator could not exist, inasmuch as nothing could arise out of nothing, any more than it could utterly perish and becoming nothing. The atoms have existed always, and always will exist; and all the various physical phenomena are brought about, from time to time, by their various motions. The soul itself is made of a finer and more subtle kind of atoms, which, when the body dies and decays, separate and are dissipated. The various processes of sense are explained on the principles of materialism. From the surfaces of all objects continually flow thin, filmy images of things (*eidola*), which, by impact on the organism, cause the phenomena of vision, hearing, etc.

In his ethical teachings, Epicurus set out with the two facts that people are susceptible of pleasure and pain and that he seeks the one and avoids the other, Epicurus declared that it is a person's duty to endeavor to increase to the utmost his pleasures and diminish to the utmost his pains-choosing that which tends to pleasure rather than that which tends to pain, and that which

tends to a greater pleasure or to a lesser pain rather than that which tends respectively to a lesser pleasure or a greater pain. He used the terms pleasure and pain in the most comprehensive way, as including pleasure and pain of both mind and body; and esteemed the pleasures and pains of the mind as incomparably greater than those of the body. The highest pleasure, then, is peace of mind (*atapaxia*, *aponia*), and this comes from phronesis or the ability to decide what line of conduct will best secure true happiness. Death, he says, is not to be feared, for " where we are, death is not; and where death is, we are not."

CRITICISMS. The charges brought against Epicurus are that he superseded all religious principles by dismissing the gods from the care of the world; that if be acknowledged their existence, it was only in conformity to popular prejudice, since, according to his system, nothing exists in nature but material atoms; that he showed great insolence and vanity in the disrespect with which lie treated the memory of former philosophers and the characters and persons of his contemporaries; and that both he and his disciples were addicted to the grossest sensuality. With respect to this first charge, it certainly admits of no refutation. The doctrine of Epicurus concerning nature militated directly against the agency of a Supreme Being in the formation and government of the world, and his misconceptions with respect to mechanical motion and the nature of divine happiness led him to divest the Deity of some of his primary attributes. It is not true, however, that he entirely denied the existence of superior powers. Cicero charges him, with inconsistency in having written books concerning piety and the reverence due to the gods, and in maintaining that the gods ought to be worshipped, while be asserted that they had no concern in human affairs. That there was an inconsistency in this is obvious. But Epicurus professed that the universal prevalence of the ideas of gods was sufficient to prove that they existed; and, thinking it necessary to derive these ideas, like all other ideas, from sensations, be imagined that the gods were beings of human form and made known to men by the customary emanations. He believed that these gods were eternal and supremely happy, living in the intermundane spaces (*metakosmia*) in a state of quiet, and meddling not with the affairs of the world. He contended that they were to be worshipped on account of the excellence of their nature, and not because they could do men either good or harm (Cic. N. D. i. 41; Sen. Ben. iv. 19).

The Internet Encyclopedia of Philosophy

Erasmus (1466-1536)

LIFE. Desiderius Erasmus Roterodamus, Dutch humanist and theologian, was born at Rotterdam, Holland, October 27, probably 1466. He died at Basel, Switzerland, on July 12, 1536. Information about his family and his early life comes from a few meager accounts he himself wrote or suggested at a somewhat advanced age, and from the many vague references which appear in his writings at all periods of his life. It appears he was born out of wedlock, but was well cared for by his parents until their early death. He received the best education open to a young man of his day in a series of monastic or semi-monastic schools. In light of later experience, he presents his early education as a long conspiracy to force him into the monastic life, but for this there exists no other evidence. He was admitted to the priesthood and took the monastic vows in 1492, but there is no record he ever exercised the priestly functions. Ironically, monasticism was one of the chief objects of attack in his lifelong assault upon what he saw as the faults of the Roman Catholic Church.

In 1495, Erasmus went to study theology at the University of Paris, then the chief seat of the later scholastic learning. Erasmus, however, found life at the university distasteful and soon departed. The chief centers of his activity from then on were Paris, France; Louvain, Belgium; Basel, Switzerland; and various parts of England. His residences in England were fruitful in the making of lifelong friendships with Thomas More, John Colet, Thomas Linacre, and William Grocynthe, leaders of English thought in the days of Henry VIII. For a time he held an honorable position as Lady Margaret professor of divinity at Cambridge, and was also offered many positions of honor and profit in the academic world. He declined all of them on one pretext or another because he apparently preferred the less certain rewards of independent literary activity. He lived three years in Italy, from 1506-09. Part of this time was spent in connection with the publishing house of Aldus Manutius at Venice, but otherwise he was far less active in association with Italian scholars than might have been expected. In Belgium, Erasmus was exposed to the petty criticism of men nearer to him in blood and political connections, but hostile to all the principles of literary and religious progress to which he was devoting his life. This lack of sympathy, which he represented as persecution, caused him to seek refuge in the more congenial atmosphere of Basel. Under the shelter of Swiss hospitality he could express himself with freedom and was always surrounded by devoted friends. It was in Basal that for many years he associated with the great publisher Froben. Also during this time, Erasmus, having been told by the church to return to the monastery, sought and received a dispensation from Pope Leo X which granted him the privilege of remaining in the world.

Erasmus was one of the most prominent and vocal scholars of his age, and was known throughout Europe. He was involved most notably in discussions concerning the state of the church. He felt called upon to use his learning in a purification of the doctrine and in a liberalizing of the institutions of Christianity. He began as a scholar, trying to free the methods of scholarship from the rigidity and formalism of medieval traditions, but was not satisfied with this. He conceived of himself as, above all else, a preacher of righteousness, and was convinced that what was needed to

regenerate Europe was sound learning, applied frankly and fearlessly to the administration of public affairs in Church and State. It is this conviction that gives unity and consistency to a life which, at first sight, seems to have been full of fatal contradictions. Erasmus was a marked individual, holding himself aloof from all entangling obligations; yet he was, in a singularly true sense, the center of the literary movement of his time. In his correspondence, he put himself in touch with more than five hundred men of the highest importance in the world of politics and of thought, and his advice on all kinds of subjects was eagerly sought, and readily followed.

At the close of his life, Erasmus found himself at odds with both the great parties in the battle over the Protestant Reformation. His last years were embittered by controversies with men toward whom he was drawn by many ties of taste and sympathy. When the city of Basel was definitely and officially "reformed" by Protestants in 1529, Erasmus gave up his residence there and settled in the imperial town of Freiburg-im-Breisgau. It would seem as if he found it easier to maintain his neutrality under Roman Catholic than under Protestant conditions. His literary activity continued without much abatement, chiefly on the lines of religious and didactic composition. For unknown reasons, Erasmus was eventually drawn once again to Basel in 1535, after an absence of six years. Here, in the midst of the group of Protestant scholars who had long been his truest friends, and, so far as is known, without relations of any sort with the Roman Catholic Church, he died. Throughout the entirety of his life he had never been called to account for his opinions by any official authority of the dominant Church. The attacks upon him were by private persons, and his protectors had always been men of the highest standing. After his death, in the zeal of the Roman Catholic reaction, his writings were honored with a distinguished place on the Index of prohibited books, and his name has generally had an evil sound in Roman Catholic ears. The extraordinary popularity of his books, however, has been shown in the immense number of editions and translations that have appeared from the sixteenth century until now, and in the undiminished interest excited by his elusive but fascinating personality.

WRITINGS. Erasmus has been most widely known for his critical and satirical writings, such as the *Praise of Folly* (Paris, 1509) and many of the Colloquia, which appeared at intervals from 1500 on. These appeal to a wider audience and deal with matters of wider human interest. Yet their author seems to have regarded them as the trifles of his intellectual product, the play of his leisure hours. His more serious writings begin early with the Enchiridion Alilitis Christioni, the *Manual (or Dagger) of the Christian Gentleman* (1503). In this little volume Erasmus outlines the views of the normal Christian life which he was to spend the rest of his days in elaborating. The key-note of it all is sincerity. The chief evil of the day, he says, is formalism, a respect for traditions, a regard for what other people think essential, but never a thought of what the true teaching of Christ may be. The remedy is for every man to ask himself at each point: what is the essential thing? and to do this without fear. Forms are not in themselves evil. It is only when they hide or quench the spirit that they are to be dreaded. In his examination of the special dangers of formalism, Erasmus pays his respects to monasticism, saint-worship, war, the spirit of class, the foibles of " society," in the fashion which was to make his later reputation as a satirist, but the main impression of the Enchiridion is distinctly that of a sermon. A companion piece to the Enchiridion is the *Institutio Principis Christiani* (Basel, 1516), written as advice to the young king Charles of Spain, later the emperor Charles V. Here Erasmus applies the same general principles of honor and sincerity to the special functions of the Prince, whom he represents throughout as the servant of the people. While in England Erasmus began the systematic examination of manuscripts of the New Testament to prepare for a new edition and Latin translation. This edition was published by

Froben of Basel in 1516 and was the basis of most of the scientific study of the Bible during the Reformation period It was the first attempt on the part of a competent and liberal-minded scholar to ascertain what the writers of the New Testament had actually said. Erasmus dedicated his work to Pope Leo X. as a patron of learning, to whom such an application of scholarship to religion must be welcome, and he justly regarded this work as his chief service to the cause of a sound Christianity. Immediately after he began the publication of his Paraphrases of the New Testament, a popular presentation of the contents of the several books. These, like all the writing of Erasmus, were in Latin, but they were at once translated into the common languages of the European peoples, a process which received the hearty approval of Erasmus himself.

IN PRAISE OF FOLLY. While visiting fellow humanist Thomas More in 1509, he composed *In Praise of Folly* (Encomium Moriae), his most famous and controversial work. Modeled after Lucian's classic Charon, the essay is written as an oratory delivered by the personification of Folly, in which Folly ironically praises foolish activities of the day. Included are attacks on superstitious religious practices, uncritical theories held by traditional scientists, and the vanity of Church leaders. Erasmus attacks superstitious folk beliefs in ghosts and goblins as well as Christian rituals involving prayers to the saints. One such superstition involved the sale of indulgence certificates by the Catholic church. An indulgence is a remission punishment for a sin which reduces the time which a person spends in purgatory. To raise money for lavish building projects, Popes authorized the sale of indulgence certificates which could remit punishment for either living people or the souls of the dead currently in purgatory. Erasmus continues satirizing an array of people and occupations, including peasants, poets, rhetoricians, layers and narrow-minded natural scientists. He turns to members of his own vocation: those who have taken monastic vows. They are neither religious nor monastic, and are too preoccupied with ritual. Although they take vows of poverty, they nevertheless make a of money through begging. Pulling no punches, Erasmus attacks the behavior of church leaders at the highest levels. The bishops live like princes. He argues that their true function would be evident if they noted the symbolism of their attire. Their vestments represent a blameless life; their forked miter hats represent knowledge of the Old and New Testaments; their gloves represent freedom from contact with worldly business; their staff represents caring for their flock; the cross carried before them in processions represents victory over all earthly affections. The word "bishop" signifies that they are to labor, care, and trouble. Although cardinals are successors of the apostles, they too neglect their true function also represented by their attire. For example, the upper white garment signifies the remarkable and singular integrity of life. If they focused on their true responsibilities, they would not want to have the job. Popes take the place of Christ, and should try to imitate Christ's life, specifically his poverty, labor, doctrine, cross, and contempt of life. However, they seem to be more concerned with financial gain.

ATTITUDE TOWARD THE REFORMATION. The outbreak of the Lutheran movement in the year following the publication of the New Testament brought the severest test of Erasmus's personal and scholarly character. It made the issue between European society and the Roman Church system so clear that no man could quite escape the summons to range himself on one side or the other of the great debate. Erasmus, at the height of his literary fame, was inevitably called upon to take sides, but partisanship in any issue which he was not at liberty himself to define was foreign equally to his nature and his habits. In all his criticism of clerical follies and abuses he had always carefully hedged himself about with protests that he was not attacking church institutions themselves and had no enmity toward the persons of churchmen. The world had laughed at his

satire, but only a few obstinate reactionaries had seriously interfered with his activities. He had a right to believe that his work so far had commended itself to the best minds and also to the dominant powers in the religious world. There can be no doubt that Erasmus was in sympathy with the main points in the Lutheran criticism of the Church. For Luther personally he had and expressed the greatest respect, and Luther always spoke with admiration of his superior learning. Luther would have gone to great lengths in securing his cooperation in a work which seemed only the natural outcome of his own. When Erasmus hesitated or refused this seemed to the upright and downright Luther a mean avoidance of responsibility explicable only as cowardice or unsteadiness of purpose, and this has generally been the Protestant judgment of later days. On the other hand the Roman Catholic party was equally desirous of holding on to the services of a man who had so often declared his loyalty to the principles it was trying, to maintain, and his half-heartedness in declaring himself now brought upon him naturally the suspicion of disloyalty from this side. Recent judgments of Erasmus, however, have shown how consistent with all his previous practice his attitude toward the Reformation really was. The evils he had combated were either those of form, such as had long been a subject of derision by all sensible men, or they were evils of a kind that could be cured only by a long and slow regeneration in the moral and spiritual life of Europe. Get rid of the absurdities, restore learning, to its rights, insist upon a sound practical piety, and all these evils would disappear: this was the program of the " Erasmian Reformation." No one could question its soundness or its desirability. Its fatal lack was that it failed to offer any tangible method of applying these principles to the existing church system. This kind of reform had been tried long enough, and men were impatient of further delay. When Erasmus was charged-and very justly-with having " laid the egg that Luther hatched " he half admitted the truth of the charge, but said he had expected quite another kind of a bird.

In their early correspondence Luther expressed in unmeasured terms his admiration for all Erasmus had done in the cause of a sound and reasonable Christianity, and exhorted him now to put the seal upon his work by definitely casting in his lot with the Lutheran party. Erasmus replied with many expressions of regard, but declined to commit himself to any party attitude. His argument was that to do so would endanger his position as a leader in the movement for pure scholarship which he regarded as his real work in life. Only through that position as an independent scholar could he hope to influence the reform of religion. The constructive value of Luther's work was mainly in furnishing a new doctrinal basis for the hitherto scattered attempts at reform. In reviving the half forgotten principle of the Augustinian theology Luther had furnished the needed impulse to that personal interest in religion which is the essence of Protestantism. This was precisely what Erasmus could not approve. He dreaded any change in the doctrine of the Church and believed that there was room enough within existing formulas for the kind of reform he valued most. Twice in the course of the great discussion he allowed himself to enter the field of doctrinal controversy, a field foreign alike to his nature and his previous practice. One of the topics formally treated by him was the freedom of the will, the crucial point in the whole Augustinian system. In his *De libero arbitrio* (1524), he analyzes with great cleverness and in perfect good temper the Lutheran exaggeration, as it seemed to him, of the obvious limitations upon human freedom. As Ms habit was, he lays down both sides of the argument and shows that each had its element of truth. His position was practically that which the Church had always taken in its dealing with the problem of sin: that Man was bound to sin, but that after all he had a right to the forgiving mercy of God, if only he would seek this through the means offered him by the Church itself. It was an easy-going Semi-Pelagianism, humane in its practice, but opening the way to those

very laxities and perversions which Erasmus and the Reformers alike were combating. The " Diatribe," clever as it was, could not lead men to any definite action, and this was precisely its merit to the Erasmians and its offense to the Lutherans.

DOCTRINE OF THE EUCHARIST. As the popular response to the Lutheran summons become more marked and more widely spread, the social disorders which Erasmus dreaded began to appear. The Peasants' War, the Anabaptist disturbances in Germany and in the Low Countries, iconoclasm and radicalism everywhere, seemed to confirm all his gloomy predictions. If this were to be the outcome of reform, he could only be thankful he had kept out of it. On the other hand, he was being ever more bitterly accused of having started the whole " tragedy." In Switzerland he was especially exposed to criticism through his association with men there who were more than suspected of extreme rationalistic doctrines. On this side the test question was naturally the doctrine of the sacraments, and the crux of this question was the observance of the Eucharist. Partly to clear himself of suspicion and partly in response to demands that lie should write something in defense of Catholic doctrine, he published in 1530 a new edition of the orthodox treatise of Algerus against the heretic Berengar of Tours in the eleventh century. He added a dedication in which he affirms positively his belief in the reality of the body of Christ after consecration in the Eucharist, but admits that the precise form in which this mystery ought to be expressed is t matter on which very diverse opinions have been held by good men. Enough, however, for the mass of Christians that the Church prescribes the doctrine and the usages that embody it, while the refinements of speculation about it may safely be left to the philosophers. Here and there in many vehement utterances on this subject Erasmus lays down the principle, quite unworthy of his genius and his position of influence: that a man may properly have two opinions on religious subjects, one for himself and his intimate friends and another for the public. The anti--

were, as Erasmus says, quoting him as holding views about the Eucharist quite similar to their own. He denies this with great heat, but in his denial betrays the fact that he had in private conversation gone just ,is far toward a rational view of the doctrine of the Eucharist as he could without a positive formulation in words. Naturally here, ,is in the case of free will, lie could not command the approval of the Church he was trying to placate.

Ethics

- CONTENTS:

INTRODUCTION. The field of ethics, also called moral philosophy, involves systematizing, defending, and recommending concepts of right and wrong behavior. Philosophers today usually divide ethical theories into three general subject areas: metaethics, normative ethics, and applied ethics. *Metaethics* investigates where our ethical principles come from, and what they mean. Are they merely social inventions? Do they involve more than expressions of our individual emotions? Metaethical answers to these questions focus on the issues of universal truths, the will of God, the role of reason in ethical judgments, and the meaning of ethical terms themselves. *Normative ethics* involves a more practical task, which is to arrive at moral standards that regulate right and wrong conduct. Should I borrow my roommate's car without first asking him? Should I steal food to support my starving family? Ideally, these moral questions could be immediately answered by consulting the moral guidelines provided by normative theories. Finally, *applied ethics* involves examining specific controversial issues, such as abortion, infanticide, animal rights, environmental concerns, homosexuality, capital punishment, or nuclear war. By using the conceptual tools of metaethics and normative ethics, discussions in applied ethics try to resolve these controversial issues.

The lines of distinction between metaethics, normative ethics, and applied ethics are often blurry. For example, the issue of abortion is an applied ethical topic since it involves a specific type of controversial behavior. But it also depends on more general normative principles, such as the right of self-rule and the right to life, which are litmus tests for determining the morality of that procedure. The issue also rests on metaethical issues such as, "where do rights come from?" and "what kind of beings have rights?"

METAETHICS. The term "meta" means *after* or *beyond*, and, consequently, the notion of metaethics involves a removed, or bird's eye view of the entire project of ethics. We may define metaethics as the study of the origin and meaning of ethical concepts. When compared to normative ethics and applied ethics, the field of metaethics is the least precisely defined area of moral philosophy. Three issues, though, are prominent: (1) *metaphysical* issues concerning whether morality exists independently of humans; (2) *psychological* issues concerning what motivates us to be moral; and (3) *linguistic* issues concerning the meaning of key ethical terms.

Metaphysical Issues in Metaethics. "Metaphysics" is the study of the kinds of things that exist in the universe. Some things in the universe are made of physical stuff, such as rocks, and perhaps other things are nonphysical in nature, such as thoughts, spirits, and gods. The metaphysical component of metaethics involves discovering specifically whether moral values are eternal truths that exist in a spirit-like realm, or simply human conventions. *Moral realism* is the view that moral principles have an objective foundation, and are not based on subjective human convention. There are two main types of moral realism. The first is commonly associated with Plato and is inspired by the field of mathematics. When we look at numbers and mathematical relations, such as 1+1=2, they seem to be timeless concepts that never change, and apply everywhere in the universe. Humans do not invent numbers, and humans ca not alter them. Plato explained the eternal character of mathematics by stating that they are *abstract entities* that exist in a spirit-like realm. He noted that moral values also are absolute truths and thus are also abstract, spirit-like entities. In this sense, for Plato, moral values as spiritual *objects*. Medieval philosophers commonly grouped all moral principles together under the heading of "eternal law" which were also frequently seen as spirit-like objects. 17th century British philosopher Samuel Clarke described them as spirit-like *relationships* rather than spirit-like objects. In either case, though, they exist in a sprit-like realm.

A second type of moral realism is that moral values are *divine commands* issuing from God's will. Sometimes called *voluntarism*, this view was inspired by the Judeo-Christian notion of an all-powerful God who is in control of everything. God simply wills things, and they become reality. He wills the physical world into existence, he wills human life into existence and, similarly, he wills all moral values into existence. Proponents of this view, such as medieval philosopher William of Ockham, believe that God wills moral principles, such as "murder is wrong," and these exist in God's mind as commands. God informs humans of these commands by implanting us with moral intuitions or revealing these commands in scripture.

The opposite view of moral realism is called *moral skepticism*, which denies any objective status of moral values. Technically moral skeptics do not reject moral values themselves. They simply deny that moral values exist as spirit-like objects, or as divine commands in the mind of God. Moral skepticism is closely associated with a position called *moral relativism*, which is the view that moral standards are grounded in social approval. With some moral values, social approval seems to vary from culture to culture. For example, in Mainland China, abortion is recognized as an important tool for population control. In the Republic of Ireland, though, abortions are not readily available even when the life of a mother is at risk. Other moral values are more fixed from culture to culture, such as prohibitions against stealing. Even these, though, are grounded in social approval insofar as similar social needs give rise to similar moral rules.

Psychological Issues in Metaethics. A second area of metaethics involves the psychological basis of our moral actions, particularly, understanding what motivates humans to be moral. Moral philosophers commonly ask the general question, "Why be moral?" A variety of answers may be given. We act morally to avoid punishment, to gain praise, to attain happiness, to be dignified, or to fit in with society. Moral psychology looks beneath the surface of these answers and attempts to identify the internal psychological factors that are ultimately responsible for moral motivation. As soon as philosophers began dissecting the human psyche and cataloging various human mental faculties, philosophers also tried linking many of these with moral motivation. Four especially noteworthy areas of moral psychology will be noted here in chronological order. First, an early theory of moral psychology was that our sense of

right and wrong was a product of a rational ability called *practical wisdom*. According to ancient Greek philosopher Aristotle, our faculty of practical wisdom intuitively grasps our ultimate purpose in life and tells us the best way to achieve happiness. Medieval philosopher Thomas Aquinas held that a related faculty called *synderesis* feeds us an intuition of our moral obligation. For Aquinas, when God created us as rational creatures, he gave us this faculty so we could tap into a special realm of moral truths.

A second area of moral psychology concerns the inherent selfishness of humans. 17th century British philosopher Thomas Hobbes held that many, if not all, of our actions are prompted by selfish desires. Even if an action seems selfless, such as donating to charity, there are still selfish causes for this, such as experiencing power over other people. This view is called *psychological egoism* and maintains that self-oriented interests ultimately motivate all human actions, with no exception. Closely related to psychological egoism is a view called *psychological hedonism* which is the view that *pleasure* is the driving force behind all of our actions. 18th century British philosopher Joseph Butler agreed that instinctive selfishness and pleasure prompt much of our conduct. However, Butler argued that we also have an inherent psychological capacity to show benevolence to others. This view is called *psychological altruism* and maintains that at least some of our actions are motivated by instinctive benevolence.

A third area of moral psychology involves a dispute concerning the role of reason in motivating moral actions. 18th century British philosopher David Hume championed the view that only emotions can motivate people to act morally. Purely rationally considerations have no influence on actions. In Hume's words, "reason is, and ought to be, the slave of the passions." 18th century German philosopher Immanuel Kant took an opposing stance. Although emotional factors do influence our conduct, we should resist this kind of sway. Instead, true moral action is motivated only by reason when it is free from emotions and desires. A recent rationalist approach, offered by Kurt Baier, focuses more broadly on the reasoning and argumentation process that takes place when making moral choices. All of our moral choices are, or at least can be, backed by some reason or justification. If I claim that it is wrong to steal someone's lawn furniture, then I should be able to justify my claim with some kind of argument. For example, I could argue that stealing Smith's lawn furniture is wrong since this would upset her, violate her ownership rights, or put the thief at risk of getting caught. According to Baier, then, proper moral decision making involves giving the best reasons in support of one course of action versus another.

Finally, since the middle of the 19th century, the field of psychology split off from philosophy and discussion of moral psychology was affected by this change. Philosophers by and large avoided references to psycho-physiological functions. Psychologists all but abandoned exploring moral psychology. A recent exception in the field of psychology is Lawrence Kohlberg's attempt to trace the development of moral thinking in adolescents and young adults. Kohlberg (1927-1987) presented his subjects with a series of moral dilemmas, such as whether it is permissible to steal food to feed one's starving family. He then noted the reasoning his subjects used in justifying their particular decisions. Kohlberg concluded that there are five levels of moral development that young people go through. In the first stage, starting at about age ten, people avoid breaking moral rules to avoid punishment. In the second stage, people follow moral rules only when it is to their advantage. In the third stage, starting about age 17, people try to live up to what is expected of them in small social groups, such as families. In the fourth stage, people fulfill the expectations of larger social groups, such as obeying laws that keep society together. In the fifth and final stage, starting at about age 24, people are guided by both absolute and relative moral principles; they follow these for altruistic reasons, though, and not because of what

they might gain individually. According to Kohlberg, few people ever reach this level.

Linguistic Issues in Metaethics. A large part of morality involves assessing people's conduct and pronouncing judgments, such as "Ted is a good person," "Bob did the right thing," and "We should all donate to charity." When we make these assessments, we rely on key terms such as "good," "right," "ought," and "should." In the early 20th century, British and American philosophers argued that if we want to fully understand morality, we must analyze the meaning of the key moral terms we use. Dozens of books appeared which minutely analyzed the nuances of these words. Today this somewhat tedious approach has lost much of its appeal. However, these discussions brought to light several aspects of moral judgments that philosophers previously overlooked. Sometimes we use language to *describe* things, such as "the door is brown." Other times we use language to *accomplish* something, such as "get away from that hot stove!" This is also the case with moral utterances such as "We should all donate to charity" which (a) attempts to *describe* the notion of charity, and (b) also attempts to *accomplish* something, such as motivate us to donate to charity.

The descriptive component of ethical statements is called its *cognitive meaning*. For example, if I say, "We should all donate to charity," I am describing charity as a good thing. I might also be describing charity as the kind of act that makes people happy, or that increases the quantity of pleasure in the world, or that God endorses, or that conforms with universal truth. In all of these cases, I am linking the notion of charity with some moral quality. Some of these qualities are *natural* in the sense that they are part of the physical world, such as human experiences of happiness or pleasure. Other qualities are *nonnatural* in the sense that they are more spirit-like, such as being endorsed by God or conforming to universal truth. In either case, though, I am describing charity by linking it with some quality.

The accomplishment-oriented component of ethical statements is called its *noncognitive meaning*. For example, if I say, "We should all donate to charity," I am trying to accomplish at least two things. First, I am trying to get you to donate to charity and I am essentially giving the command, "Donate to charity, Mr.!" Philosophers call this the *prescriptive* element in the sense that I am prescribing some specific behavior. Secondly, I am expressing my personal feelings of approval about charitable donations and I am in essence saying "Hooray for charity!" This is the *emotive* element insofar as I am expressing my emotions about some specific behavior.

Ethical judgments, such as "We should all donate to charity," then, are mixtures of both descriptive (cognitive) and accomplishment-oriented (noncognitive) components. Philosopher R.M. Hare (b. 1919) argued that the descriptive component of ethical statements changes depending on our philosophical and religious perspective. For example, a religious believer might describe charity as something that God endorses. An atheist, though, would describe charity differently. However, Hare argues, the accomplishment-oriented component of ethical judgments is the same for *everyone*. For example, when the religious believer and atheist both say, "We should all donate to charity" they both encourage others to be charitable and express their personal approval of charity. For Hare, then, the accomplishment-oriented component is the primary meaning of moral utterences, and the descriptive component is secondary.

NORMATIVE ETHICS. Normative ethics involves arriving at moral standards that regulate right and wrong conduct. In a sense, it is a search for an ideal litmus test of proper behavior. The Golden Rule is a classic example of a normative principle: We should do to others what we would want others to do to us. Since I do not want my neighbor to steal my car, then it is wrong for me to steal her car. Since I would

want people to feed me if I was starving, then I should help feed starving people. Using this same reasoning, I can theoretically determine whether any possible action is right or wrong. So, based on the Golden Rule, it would also be wrong for me to lie to, harass, victimize, assault, or kill others. The Golden Rule is an example of a normative theory that establishes a *single principle* against which we judge all actions. Other normative theories focus on a *set* of foundational principles, such as moral rights to life, liberty, and happiness.

The key assumption in normative ethics is that there is only *one* ultimate criterion of moral conduct, whether it is a single rule or a set of principles. Unfortunately, philosophers do not agree about what precisely that criterion is. Over the centuries, hundreds of theories have been offered, each claiming to be the ultimate guide. Proponents of these theories also devote much time to rejecting rival theories. For example, most normative ethicists reject the Golden Rule in the above form. If I am a masochist then, according to the Golden Rule, it is morally permissible for me to inflict pain on other people. But inflicting pain on others is clearly wrong, hence the Golden Rule fails as the ultimate criterion of morality. In spite of the quantity of normative theories available for consideration, many theories involve common strategies that we can classify. Three strategies will be noted here: (1) virtue theory, (2) deontological theories, and (3) consequentialist theories.

Virtue Theory. Many philosophers believe that morality consists of following precisely defined rules of conduct, such as "don't kill," or "don't steal." Presumably, I must learn these rules, and then make sure each of my actions live up to the rules. Virtue theorists, however, place less emphasis on learning rules, and instead stress the importance of developing *good habits of character*, such as benevolence. Once I've acquired benevolence, for example, I will then habitually act in a benevolent manner. Historically, virtue theory is the oldest normative tradition in Western philosophy, having its roots in ancient Greek civilization. Plato emphasized four virtues in particular, which were later called *cardinal virtues*: wisdom, courage, temperance and justice. Other important virtues are fortitude, generosity, self-respect, good temper, and sincerity. In addition to advocating good habits of character, virtue theorists hold that we should avoid acquiring bad character traits, or *vices*, such as cowardice, insensibility, injustice, and vanity. Virtue theory emphasizes moral education since virtuous character traits are developed in one's youth. Adults, therefore, are responsible for instilling virtues in the young.

Aristotle gave the first systematic expression to virtue theory in his *Nichomachean Ethics*. Aristotle sees virtues as good habits that we acquire, which regulate our emotions. For example, in response to my natural feelings of fear, I should develop the virtue of courage which allows me to be firm when facing danger. Analyzing 11 specific virtues, Aristotle argues that most virtues fall at a mean between more extreme character traits. With courage, for example, if I do not have enough courage, I develop the disposition of cowardice, which is a vice. If I have too much courage I develop the disposition of rashness which is also a vice. According to Aristotle, it is not an easy task to find the perfect mean between extreme character traits. In fact, we need assistance from our reason to do this. After Aristotle, medieval theologians supplemented Greek theories of virtue with three Christian virtues, or *theological virtues*: faith, hope, and charity. Interest in virtue theory continued through the middle ages and declined in the 19th century with the rise of alternative moral theories below.

Deontological (Duty) Theories. Many of us feel that there are clear obligations we have as human beings, such as to care for our children, and to not commit murder. Deontological theories base morality on specific, foundational principles of obligation. These theories are called *deontological* theories, from the Greek word *deon*, or duty, given the foundational nature of our duty or obligation. They are also

sometimes called *nonconsequentialist* since these principles are obligatory, irrespective of the consequences of that might follow from our actions. For example, it is wrong to abandon care for our children even if it results in some great benefit. There are four leading types of deontological theories.

The first is *duty theory* championed by Hugo Grotius and Samuel Pufendorf. By the 17th century, virtue theorists listed nearly one hundred virtuous character traits that a good person should acquire. Grotius and Pufendorf viewed these as lists of obligations to which we are all duty-bound through laws of nature. They classified these duties under three headings: duties to God, duties to oneself, and duties to others. Duties to God include honoring him, serving him, and praying to him. Duties to oneself include preserving one's life, pursuing happiness, and developing one's talents. Duties to others fall into three groups. First, there are family duties which involve honoring our parents, and caring for spouses and children. Second, there are social duties which involve not harming others, keeping promises, and benevolence. Third, there are political duties that involve obedience to the laws, and public spirit. Based on these duties it would be wrong, for example, for us to skip worship services, to commit suicide, or steal from others. The morality of all actions, then, is determined in reference to these duties. For almost 200 years, duty theory dominated normative ethical theories.

A second deontological theory is *rights theory*. According to rights theorists, these are rights that all people naturally have, and the rest of us are obligated to acknowledge. 17th century British philosopher John Locke argued that the laws of nature mandate that we should not harm anyone's life, health, liberty or possessions. For Locke, these are our natural rights, given to us by God. Following Locke's lead, US Declaration of Independence authored by Thomas Jefferson recognizes three foundational rights: life, liberty, and the pursuit of happiness. Jefferson and others maintained that we deduce other more specific rights from these, including the rights of property, movement, speech, and religious expression. There are four features traditionally associated with moral rights. First, rights are *natural* insofar as they are not invented or created by governments. Second, they are *universal* insofar as they do not change from country to country. Third, they are *equal* in the sense that rights are the same for all people, irrespective of gender, race, or handicap. Fourth, they are *inalienable* which means that I ca not hand over my rights to another person, such as by selling myself into slavery.

A third deontological theory is that of the *categorical imperative* as developed by the18th-century German philosopher Immanuel Kant. Influenced by Grotius and Pufendorf, Kant agreed that we have moral duties to oneself and others, such as developing one's talents, and keeping our promises to others. However, Kant argued that there is a more foundational principle of duty that encompasses our particular duties. It is a single, self-evident principle of reason that he calls the "categorical imperative." Kant gives at least four versions of the categorical imperative, but one is especially direct: Treat people as an end, and never as a means to an end. That is, we should always treat people with dignity, and never use them as mere instruments. For Kant, we treat people as an end whenever our actions toward someone reflect the inherent value of that person. Donating to charity, for example, is morally correct since this acknowledges the inherent value of the recipient. By contrast, we treat someone as a means to an end whenever we treat that person as a tool to achieve something else. It is wrong, for example, to steal my neighbor's lawn furniture since I would be treating her as a means to my own happiness. The categorical imperative also regulates the morality of actions that affect us individually. Suicide, for example, would be wrong since I would be treating my life as a means to the alleviation of my misery. Kant believes that the morality of all actions can be determined by appealing to this single principle of duty.

A fourth deontological theory is a recent revision of duty theory by British philosopher W.D. Ross, which emphasizes *prima facie* duties. Like his 17th and 18th century counterparts, Ross argues that our duties are "part of the fundamental nature of the universe." However, Ross's list of duties is much shorter which he believes reflects our actual moral convictions:

- Fidelity: the duty to keep promises
- Reparation: the duty to compensate others when we harm them
- Gratitude: the duty to thank those who help us
- Justice: the duty to recognize merit
- Beneficence: the duty to improve the conditions of others
- Self-improvement: the duty to improve our virtue and intelligence
- Nonmaleficence: the duty to not injure others

Although some of these duties are the same as those of traditional duty theory, such as beneficence and self-improvement, Ross does not include duties to God, self-preservation, or political duties. This list is not complete, Ross argues, but he believes that at least some of these are self-evidently true. Ross recognizes that situations will arise when we must choose between two conflicting duties. In a classic example, suppose I borrow my neighbor's gun and promise to return it when he asks for it. One day, in a fit of rage, my neighbor pounds on my door and asks for the gun so that he can take vengeance on someone. On the one hand, the duty of fidelity obligates me to return the gun; on the other hand, the duty of nonmaleficence obligates me to avoid injuring others and thus not return the gun. According to Ross, I will intuitively know which of these duties is my *actual* duty, and which is my apparent or *prima facie* duty. In this case, my duty of nonmaleficence emerges as my actual duty and I should not return the gun.

Consequentialist (Teleological) Theories. It is common for us to determine our moral responsibility by weighing the consequences of our actions. According to consequentialist normative theories, correct moral conduct is determined *solely* by a cost-benefit analysis of an action's consequences:

- *Consequentialism:* An action is morally right if the consequences of that action are more favorable than unfavorable.

Consequentialist normative principles require that we first tally both the good and bad consequences of an action. Second, we then determine whether the total good consequences outweigh the total bad consequences. If the good consequences are greater, then the action is morally proper. If the bad consequences are greater, then the action is morally improper. Consequentialist theories are also called *teleological* theories, from the Greek word *telos,* or end, since the end result of the action is the sole determining factor of its morality.

Consequentialist theories first became popular in the 18th century by philosophers who wanted a quick way to morally assess an action by appealing to experience, rather than by appealing to gut intuitions or long lists of questionable duties. In fact, the most attractive feature of consequentialism is that it appeals to publicly observable consequences of an action. Most versions of consequentialism are more precisely formulated than the general principle above. In particular, competing consequentialist theories specify which consequences for affected groups of people are relevant. Three subdivisions of consequentialism emerge:

- *Ethical Egoism:* an action is morally right if the consequences of that action are more

favorable than unfavorable *only to the agent* performing the action.

Ethical Altruism: an action is morally right if the consequences of that action are more favorable than unfavorable *to everyone except the agent*.

Utilitarianism: an action is morally right if the consequences of that action are more favorable than unfavorable *to everyone*.

All three of these theories focus on the consequences of actions for different groups of people. But, like all normative theories, the above three theories are rivals of each other. They also yield different conclusions. Consider the following example. A woman was traveling through a developing country when she witnessed a car in front of her run off the road and roll over several times. She asked the hired driver to pull over to assist but, to her surprise, the driver accelerated nervously past the scene. A few miles down the road the driver explained that in his country if someone assists an accident victim, then the police often hold the assisting person responsible for the accident itself. If the victim dies, then the assisting person could be held responsible for the death. The driver continued explaining that road accident victims are therefore usually left unattended and often die from exposure to the country's harsh desert conditions.On the principle of ethical egoism, the woman in this illustration would only be concerned with the consequences of her attempted assistance as *she* would be affected. Clearly, the decision to drive on would be the morally proper choice. On the principle of ethical altruism, she would be concerned only with the consequences of her action as *others* are affected, particularly the accident victim. Tallying only those consequences reveals that assisting the victim would be the morally correct choice, irrespective of the negative consequences that result for her. On the principle of utilitarianism, she must consider the consequences for both herself and the victim. The outcome here is less clear, and the woman would need to precisely calculate the overall benefit versus disbenefit of her action.

Types of Utilitarianism. Jeremy Bentham (1748-1832) presented one of the earliest fully developed systems of utilitarianism. Two features of Bentham's theory are noteworty. First, Bentham proposed that we tally the consequences of each action we perform and thereby determine on a case by case basis whether an action is morally right or wrong. This aspect of Bentham's theory is known as *act-utilitiarianism*. Second, Bentham also proposed that we tally the pleasure and pain which results from our actions. For Bentham, pleasure and pain are the only consequences that matter in determining whether our conduct is moral. This aspect of Bentham's theory is known as *hedonistic utilitarianism*. Critics point out limitations in both of these aspects.

First, according to act-utilitarianism, it would be morally wrong to waste time on leisure activities such as watching television, since our time could be spent in ways that produced a greater social benefit, such as charity work. But prohibiting leisure activities doesn't seem reasonable. More significantly, according to act-utilitarianism, specific acts of torture or slavery would be morally permissible if the social benefit of these actions outweighed the disbenefit. A revised version of utilitarianism called *rule-utilitarianism* addresses these propblems. According to rule-utilitarianism, a behavioral code or rule is morally right if the consequences of adopting that rule are more favorable than unfavorable to everyone. Unlike act utilitarianism, which weighes the consequences of each particular action, rule-utilitarianism offers a litmus test only for the morality of moral rules, such as "stealing is wrong." Adopting a rule against theft clearly has more favorable consequences than unfavorable consequences for everyone. The same is true for moral rules against lying or murdering. Rule-utilitarianism, then, offers a three-tiered method for judging conduct. A particular action, such as stealing my neighbor's lawn furniture, is judged wrong

since it violates a moral rule against theft. In turn, the rule against theft is morally binding because adopting this rule produces favorable consequences for everyone. J.S. Mill's version of utilitarianism is rule-oriented.

Second, according to hedonistic utilitiarianism, pleasurable consequences are the only factors that matter, morally speaking. This, though, seems too restrictive since it ignores other morally significant consequences which are not necessarily pleasing or painful. For example, acts which foster loyalty and friendship are valued, yet they are not always pleasing. In response to this problem, G.E. Moore proposed *ideal utilitarianism*, which involves tallying any consequence that we intuitively recognize as good or bad (and not simply as pleasurable or painful). Also, R.M. Hare proposed *preference utilitarianism*, which involves tallying any conseqence that fulfills our preferences.

Social Contract Theory. In addition to ethical egoism, ethical altruism, and utilitarianism, as defined above, we also find an egoistic consequentialist strategy in social contract theory. Thomas Hobbes argued that, for purely selfish reasons, the agent is better off living in a world with moral rules than one without moral rules. For without moral rules, we are subject to the whims of other people's selfish interests. Our property, our families, and even our lives are at continual risk. Selfishness alone will therefore motivate each agent to adopt a basic set of rules which will allow for a civilized community. Not surprisingly, these rules would include prohibitions against lying, stealing and killing. However, these rules will ensure safety for each agent only if the rules are enforced. As selfish creatures, each of us would plunder our neighbors' property once their guards were down. Each agent would then be at risk from his neighbor. Therefore, for selfish reasons alone, we devise a means of enforcing these rules: we create a policing agency which punishes us if we violate these rules.

APPLIED ETHICS. Applied ethics is the branch of ethics that consists of the analysis of specific, controversial moral issues such as abortion, animal rights, and euthanasia. Medical ethics focuses on a range of issues that arise in clinical health care settings. Health care workers are in an unusual position of continually dealing with life and death situations. It is not surprising, then, that medical ethics issues are more extreme and diverse than other areas of applied ethics. Prenatal issues arise about the morality of surrogate mothering, genetic manipulation of fetuses, the status of unused frozen embryos, and abortion. Other issues arise about patient rights and physician's responsibilities, such as the confidentiality of the patient's records and the physician's responsibility to tell the truth to dying patients. The AIDS crisis has raised the specific issues of the mandatory screening of all patients for AIDS, and whether physicians can refuse to treat AIDS patients. Additional issues concern medical experimentation on humans, the morality of involuntary commitment, and the rights of the mentally retarded. Finally, end of life issues arise about the morality of suicide, the justifiability of suicide intervention, physician assisted suicide, and euthanasia.

The field of business ethics examines moral controversies that commonly arise in the business world. These include the social responsibilities of capitalist business practices, the moral status of corporate entities, deceptive advertising, insider trading, basic employee rights, job discrimination, affirmative action, whether drug testing violates privacy, and whistle blowing. Issues in environmental ethics often overlaps with business and medical issues. These include the rights of animals, the morality of animal experimentation, preserving endangered species, pollution control, management of environmental resources, whether ecosystems are entitled to direct moral consideration, and our obligation to future generations. Controversial issues of sexual morality include monogamy vs. polygamy, sexual relations

without love, homosexual relations, and extramarital affairs. Finally, there are issues of social morality, which examine capital punishment, nuclear war, gun control, suicide, recreational use of drugs, welfare rights, and racism.

Euclides (c. 430-360 BCE.)

Euclides was a native of Megara, and founder of the Megarian or Eristic sect. He applied himself early to the study of philosophy, and learned from the writings of Parmenides the art of disputation. Hearing of the fame of Socrates, Euclides moved to Athens and became a devoted student for many years. Because of an enmity between Athenians and Megarians, a decree was passed which forbid any Megarian from entering Athens under the penalty of death. Euclides moved twenty miles out of Athens, and would sneak into the city at night for instruction, dressed as a woman in a long cloak and veil. He frequently became involved in business disputes in civil courts. Socrates, who despised forensic contests, expressed dissatisfaction with Euclides for his fondness for controversy. It is likely that this provoked a separation between Euclides and Socrates, for after this Euclides was the head of a school in Megara which taught the art of disputation. Debates were conducted with so much vehemence among his pupils, that Timon said of Euclides that he carried the madness of contention from Athens of Megara (*Diog. Laert,* 6:22). Nevertheless, his restraint is attested to in a story about a quarrel he had with his brother. His brother charged, "Let me perish if do not have revenge on you." To this Euclides replied, "And let *me* perish if I don not subdue your resentment by forbearance, and make you love me as much as ever." In disputes Euclides was averse to the analogical method of reasoning, and judged that legitimate argumentation consists in deducing fair conclusions from acknowledge premises.

His position was a combination of Socraticism and Eleaticism. Virtue is knowledge, but knowledge of what? It is here that the Eleatic influence became visible. With Parmenides, the Megarics believed in the one Absolute being. All multiplicity, all motion, are illusory. The world of sense has in it no true reality. Only Being is. If virtue is knowledge, therefore, it can only be the knowledge of this Being. If the essential concept of Socrates was the Good, and the essential concept of Parmenides Being, Euclides now combined the two. Thus, according to Cicero, he defined the "supreme good" as that which is always the same. The Good is identified with Being. Being, the One, God, Intelligence, providence, the Good, divinity, are merely different names for the same thing. Becoming, the many, evil, are the names of its opposite, not-being. Multiplicity is thus identified with evil, and both are declared illusory. Evil has no real existence. The good alone truly is. The various virtues, as benevolence, temperance, prudence, are merely different names for the one virtue, knowledge of being. It is said that when Euclides was asked his opinion concerning the gods, he replied, "I know nothing more of them than this, that they hate inquisitive persons."

Euthanasia

The applied ethical issue of euthanasia, or mercy killing, concerns whether it is morally permissible for a third party, such as a physician, to end the life of a terminally ill patient who is in intense pain.

The euthanasia controversy is part of a larger issue concerning the right to die. Staunch defenders of personal liberty argue that all of us are morally entitled to end our lives when we see fit. Thus, according to these people, suicide is in principle morally permissible. For health care workers, the issue of the right to die is most prominent when a patient in their care (1) is terminally ill, (2) is in intense pain, and (3) voluntarily chooses to end his life to escape prolonged suffering. In these cases, there are several theoretical options open to the health care worker. First, the worker can ignore the patient's request and care can continue as usual. Second, the worker can discontinue providing life-sustaining treatment to the patient, and thus allow him to die more quickly. This option is called passive euthanasia since it brings on death through nonintervention. Third, the health care worker can provide the patient with the means of taking his own life, such as a lethal dose of a drug. This practice is called assisted suicide, since it is the patient, and not technically the health care worker, who administers the drug. Finally, the health care worker can take active measures to end the patient's life, such as by directly administering a lethal dose of a drug. This practice is called active euthanasia since the health care worker's action is the direct cause of the patient's death. Active euthanasia is the most controversial of the four options and is currently illegal in the United States. However, several right to die organizations are lobbying for the laws against active euthanasia to change.

Two additional concepts are relevant to the discussion of euthanasia. First, voluntary euthanasia refers to mercy killing that takes place with the explicit and voluntary consent of the patient, either verbally or in a written document such as a living will. Second, nonvoluntary euthanasia refers to the mercy killing of a patient who is unconscious, comatose, or otherwise unable to explicitly make his intentions known. In these cases it is often family members who make the request. It is important not to confuse nonvoluntary mercy killing with involuntary mercy killing. The latter would be done against the wishes of the patient and would clearly count as murder.

Like the moral issues surrounding suicide, the problem of euthanasia has a long history of philosophical discussion. On the whole, ancient Greek thinkers seem to have favored euthanasia, even though they opposed suicide. An exception is is Hippocrates (460-370 BCE), the ancient Greek physician, who in his famous oath states that "I will not prescribe a deadly drug to please someone, nor give advice that may cause his death." The entire oath is presented below, which places emphasis on the value of preserving life and in putting the good of patients above the private interests of physicians. These two aspects of the oath make it an important creed for many heath care workers today. In medieval times, Christian, Jewish, and Muslim philosophers opposed active euthanasia, although the Christian Church has always accepted passive euthanasia.

During the Renaissance, English humanist Thomas More (1478-1535) defended Euthanasia in book Utopia (1516). More describes in idealic terms the function of hospitals. Hospital workers watch after patients with tender care and do everything in their power to cure ills. However, when a patient has a torturous and incurable illness, the patient has the option to die, either through starvation or opium. In New Atlantis (1627), British philosopher Francis Bacon (1561-1626) writes that physicians are "not only to restore the health, but to mitigate pain and dolours; and not only when such mitigation may conduce to recovery, but when it may serve to make a fair and easy passage."

One of the most cited contemporarly discussions on the subject of euthanasia is "Active and Passive Euthanasia" (1975) by University of Alabama philosophy professor James Rachels. Rachels argues that there is no moral difference between actively killing a patient and passively allowing the patient to die. Thus, it is less cruel for physicians to use active procedures of mercy killing. Rachels argues that, from a strictly moral standpoint, there is no difference between passive and active euthanasia. He begins by noting that the AMA prohibits active euthanasia, yet allows passive euthanasia. He offers two arguments for why physicians should place passive euthanasia in the same category as active euthanasia. First, techniques of passive euthanasia prolong the suffering of the patient, for it takes longer to passively allow the patient to die than it would if active measures were taken. In the mean time, the patient is in unbearable pain. Since in either case the decision has been made to bring on an early death, it is cruel to adopt the longer procedure. Second, Rachels argues that the passive euthanasia distinction encourages physicians to make life and death decisions on irrelevant grounds. For example, Down's syndrome infants often have correctable congenital defects; but decisions are made to forego corrective surgery (and thus let the infant die) because the parents do not want a child with Down's syndrome. The active-passive euthanasia distinction merely encourages these groundless decisions.

Rachels observes that people think that actively killing someone is morally worse than passively letting someone die. However, they do not differ since both have the same outcome: the death of the patient on humanitarian grounds. The difference between the two is accentuated because we frequently hear of terrible cases of active killings, but not of passive killings. Rachels anticipates two criticisms to his argument. First, it may be objected that, with passive euthanasia techniques, the physician does not have to do anything to bring on the patient's death. Rachels replies that letting the patient die involves performing an action by not performing other actions (similar to the act of insulting someone by not shaking their hand). Second, it may be objected that Rachels's point is only of academic interest since, in point of fact, active euthanasia is illegal. Rachels replies that physicians should nevertheless be aware that the law is forcing on them an indefensible moral doctrine.

In "Active and Passive Euthanasia: An Impertinent Distinction?" (1977), Thomas Sullivan argues that no intentional mercy killing (active or passive) is morally permissible. However, extraordinary means of prolonging life may be discontinued even though the patient's death may be foreseen. Sullivan argues that Rachels's example of the Down's syndrome infant is misleading, since most doctors would perform corrective surgery since it would be clearly wrong to let the infant die. Further, most reflective people will agree with Rachels that there is no moral distinction between killing someone and allowing someone to die. According to Sullivan, Rachels's biggest mistake is that he misunderstands the position of the AMA. The AMA maintains that all intentional mercy killing is wrong, either active or passive. Although extraordinary procedures for prolonging life may be discontinued for terminally ill patients, these procedures are ones that are both

inconvenient and ineffective for the patient. If death occurs more quickly by discontinuing extraordinary procedures, it is only a byproduct. In short, to aim at death (either actively or passively) is always wrong, but it is not wrong to merely foresee death when discontinuing extraordinary procedures.

In a rejoinder essay, "More Impertinent Distinctions and a Defense of Active Euthanasia" (1978), Rachels responds to Sullivan's charges. Rachels begins noting that Catholic thinkers, such as Sullivan, typically oppose mercy killing. However, Sullivan himself concedes that it is sometimes pointless to prolong the dying process. Rachels focuses on two specific points made by Sullivan. First, Sullivan argues that it is important for the physician to have the correct intention (insofar as it is immoral to aim at the death of a patient, but not immoral to foresee his death). Rachels counters that the physician's intention is irrelevant to whether the act is right or wrong. For, suppose two physicians perform identical acts of withholding treatment, with one physician aiming at the death of the patient, and the other only foreseeing it. Since the acts are identical, one cannot be judged right and the other wrong. Second, Sullivan argues that physicians are justified only in withholding extraordinary procedures. However, Rachels argues, to determine whether a given procedure is ordinary or extraordinary, we must first determine whether the patient's life should be prolonged.

Rachels continues by offering several arguments in favor of the moral permissibility of active euthanasia. The first is an argument from mercy. He begins by describing a classic case where a person named Jack is terminally ill and in unbearable pain. Jack's condition alone is a compelling reason for the permissibility of active mercy killing. A more formal utilitarian version of this argument is that active euthanasia is morally permissible since it produces the greatest happiness. Critics have traditionally attacked utilitarianism for focusing too heavily on happiness, and not enough on other intrinsic goods, such as justice and rights. Accordingly, Rachels offers a revised utilitarian version: active euthanasia is permissible since it promotes the best interests of everyone (such as Jack, Jack's wife, and the hospital staff). Rachels also argues that the golden rule supports active euthanasia insofar as we would want others to put us out of our misery if we were in a situation like Jack's. A more formal version of this argument is based on Kant's categorical imperative ("act only on that maxim by which you can at the same time will that it should become a universal law"). The categorical imperative supports active euthanasia since no one would willfully universalize a rule which condemns people to unbearable pain before death. Rachels closes noting an irony: the golden rule supports active euthanasia, yet the Catholic church has traditionally opposed it.

Evolution

ANCIENT GREEK VIEWS. Evolution is not so much a modern discovery as some of its advocates would have us believe. It made its appearance early in Greek philosophy, and maintained its position more or less, with the most diverse modifications, and frequently confused with the idea of emanation, until the close of ancient thought. The Greeks had, it is true, no term exactly equivalent to " evolution"; but when Thales asserts that all things originated from water; when Anaximenes calls air the principle of all things, regarding the subsequent process as a thinning or thickening, they must have considered individual beings and the phenomenal world as, a result of evolution, even if they did not carry the process out in detail. Anaximander is often regarded as a precursor of the modem theory of development. He deduces living beings, in a gradual development, from moisture under the influence of warmth, and suggests the view that men originated from animals of another sort, since if they had come into existence as human beings, needing fostering care for a long time, they would not have been able to maintain their existence. In Empedocles, as in Epicurus and Lucretius, who follow in Hs footsteps, there are rudimentary suggestions of the Darwinian theory in its broader sense; and here too, as with Darwin, the mechanical principle comes in; the process is adapted to a certain end by a sort of natural selection, without regarding nature as deliberately forming its results for these ends.

If the mechanical view is to be found in these philosophers, the teleological occurs in Heraclitus, who conceives the process as a rational development, in accordance with the Logos and names steps of the process, as from igneous air to water, and thence to earth. The Stoics followed Heraclitus in the main lines of their physics. The primal principle is, as with him, igneous air. only that this is named God by them with much greater definiteness. The Godhead has life in itself, and develops into the universe, differentiating primarily into two kinds of elements the finer or active, and the coarser or passive. Formation or development goes on continuously, under the impulse of the formative principle, by whatever name it is known, until all is once more dissolved by the *ekpyrosis* into the fundamental principle, and the whole process begins over again. Their conception of the process as analogous to the development of the seed finds special expression in their term of *logos spermatikos*. In one point the Stoics differ essentially from Heraclitus. With them the whole process is accomplished according to certain ends indwelling in the Godhead, which is a provident, careful intelligence, while no providence is assumed in Heraclitus.

Empedocles asserts definitely that the sphairos, as the full reconciliation of opposites, is opposed, as the superior, to the individual beings brought into existence by hatred, which are then once more united by love to the primal essence, the interchange of world-periods thus continuing indefinitely. Development is to be found also in the atomistic philosopher Democritus; in a purely mechanical manner without any purpose, bodies come into existence out of atoms, and ultimately entire worlds appear and disappear from and to eternity. Like his predecessors, Deinocritus, deduces organic beings from what is inorganic-moist earth or slime.

Development, as well as the process of becoming, in general, was denied by the Eleatic philosophers. Their doctrine, diametrically opposed to the older thoroughgoing evolutionism, had its influence in determining the acceptance of unchangeable ideas, or forms, by Plato and Aristotle. Though Plato reproduces the doctrine of Heraclitus as to the flux of all things in the phenomenal world, he denies any continuous change in the world of ideas. Change is permanent only in so far as the eternal forms stamp themselves upon individual objects. Though this, as a rule, takes place but imperfectly, the stubborn mass is so far affected that all works out as far as possible for the best. The demiurge willed that all should become as far as possible like himself; and so the world finally becomes beautiful and perfect. Here we have a development, though the principle which has the most real existence does not change; the forms, or archetypal ideas, remain eternally what they are.

In Aristotle also the forms are the real existences, working in matter but eternally remaining the same, at once the motive cause and the effectual end of all things. Here the idea of evolution is clearer than in Plato, especially for the physical world, which is wholly dominated by purpose. The transition from lifeless to living matter is a gradual one, so that the dividing-line between them is scarcely perceptible. Next to lifeless matter comes the vegetable kingdom, which seems, compared with the inorganic, to have life, but appears lifeless compared with the organic. The transition from plants to animals is again a gradual one. The lowest organisms originate from the primeval slime, or from animal differentiation; there is a continual progression from simple, undeveloped types to the higher and more perfect. As the highest stage, the end and aim of the whole process, man appears; all lower forms are merely unsuccessful attempts to produce him. The ape is a transitional stage between man and other viviparous animals. If development has so important a work in Aristotle's physics, it is not less important in his metaphysics. The whole transition from potentiality to actuality (from *dynamis* to *entelecheia*) is nothing but a transition from the lower to the higher, everything striving to assimilate itself to the absolutely perfect, to the Divine. Thus Aristotle, like Plato, regards the entire order of the universe as a sort of deification. But the part played in the development by the Godhead, the absolutely immaterial form, is less than that of the forms which operate in matter, since, being already everything,, it is incapable of becoming anything else. Thus Aristotle, despite his evolutionistic notions, does not take the view of a thoroughgoing evolutionist as regards the universe; nor do the Neoplatonists, whose highest principle remains wholly unchanged, though all things emanate from it.

MEDIEVAL VIEWS. The idea of evolution was not particularly dominant in patristic and scholastic theology and philosophy, both on account of the dualism which runs through them as an echo of Plato and Aristotle, and on account of the generally accepted Christian theory of creation. However, evolution is not generally denied; and with Augustine (*De civitate dei*, xv. 1) it is taken as the basis for a philosophy of history. Erigena and some of his followers seem to teach a sort of evolution. The issue of finite beings from God is called *analysis* or *resolution* in contrast to the *reverse* or *deification* the return to God, who once more assimilates all things. God himself, although denominated the beginning, middle, and end, all in all remains unmixed in his own essence, transcendent though immanent in the world. The teaching of. Nicholas of Cusa is similar to Erigena's, though a certain amount of Pythagoreanism comes in here. The world exhibits explicitly what the Godhead implicitly contains; the world is an animated, ordered whole, in which God is everywhere present. Since God embraces all things in himself, he, unites all opposites: he is the *complicatio omnium contradictoriorum*. The idea of evolution thus appears in Nicholas in a rather pantheistic form, but it is not logically carried out.

In spite of some obscurities in his conception of the world Giordano Bruno is a little clearer. According to him God is the immanent first cause in the universe; there is no difference between matter and form; matter, which includes in itself forms and ends, is the source of all becoming and of all actuality. The infinite ether which fills infinite space conceals within itself the nucleus of all things, and they proceed from it according to determinate laws, yet in a teleological manner. Thus the worlds originate not by an arbitrary act, but by an inner necessity of the divine nature. They are *natura naturata,* as distinguished from the operative nature of God, natitra naturans, which is present in all thin-S as the being- of all that is, the beauty of all that is fair. As in the Stoic teaching, with which Bruno's philosophy has much in common, the conception of evolution comes out clearly both for physics and metaphysics.

IN MODERN PHILOSOPHY. Leibniz attempted to reconcile the mechanical-physical and the teleological views, after Descartes, in his *Principia philosophitce,* excluding all purpose, had explained nature both lifeless and living, as mere mechanism. It is right, however, to point out that Descartes had a metaphysics above his physics, in which the conception of God took an important place, and that thus the mechanical notion of evolution did not really include everything. In Leibnitz the principles of mechanics and physics are dependent upon the direction of a supreme intelligence, without which they would be inexplicable to us. Only by such a preliminary assumption are we able to recognize that one ordered thing follows upon another continuously. It is in this sense that the law of continuity is to be understood, which is of such great importance in Leibnitz. At bottom it is the same as the law of ordered development. The genera of all beings follow continuously one upon another, and between the main classes, as between animals and vegetables, there must be a continuous sequence of intermediate beings. Here again, however, evolution is not taught in its most thorough form, since the divine monad, of God, does not come into the world but transcends it.

Among the German philosophers of the eighteenth century Herder must be mentioned first of the pioneers of modern evolutionism. He lays down the doctrine of a continuous development in the unity of nature from inorganic to organic, from the stone to the plant, from the plant to the animal, and from the animal to man. As nature develops according to fixed laws and natural conditions, so does history, which is only a continuation of the process of nature. Both nature and history labor to educate man in perfect humanity; but as this is seldom attained, a future life is suggested. Lessing had dwelt on the education of the human race as a development to the higher and more perfect. It is only recently that the significance of Herder, in regard to the conception and treatment of historic development, has been adequately recognized. Goethe also followed out the idea of evolution in his zoological and botanical investigations, with his theory of the metamorphosis of plants and his endeavor to discover unity in different organisms.

IN GERMAN IDEALISM. Kant is also often mentioned as having been an early teacher of the modern theory of descent. It is true he considers the analogy of the forms which he finds in various classes of organisms a ground for supposing that they may have come originally from a common source. He calls the hypothesis that specifically different being have originated one from the other "a daring adventure of the reason." But he entertains the thought that in a later epoch "an orang-outang or a chimpanzee may develop the organs which serve for walking, grasping objects, and speaking-in short, that lie may evolve the structure of man, with an organ for the use of reason, which shall gradually develop itself by social culture." Here, indeed, important ideas of Darwin were anticipated; but Kant's critical system was such that development could have no predominant place in it.

The idea of evolution came out more strongly in his German idealistic successors, especially in Schelling, who regarded nature as a preliminary stage to mind, and the process of physical development as continuing in history. The unconscious productions of nature are only unsuccessful attempts to reflect itself; lifeless nature is an immature intelligence, so that in its phenomena an intelligent character appears only unconsciously. Its highest aim, that, of becoming an object to itself, is only attained in the highest and last reflection-in man, or in what we call reason, through which for the first time nature returns perfectly upon itself. All stages of nature are connected by a common life, and show in their development a conclusive unity. The course of history as a whole must be conceived as offering a gradually progressive revelation of the Absolute. For this he names three periods-that of fate, that of nature, and that of providence, of which we are now in the second. Schelling's followers carried the idea of development somewhat further than their master. This is true especially of Oken, who conceives natural science as the science of the eternal transformation of God into the world, of the dissolution of the Absolute into plurality, and of its continuous further operation in this plurality. The development is continued through the vegetable and animal kingdoms up to man, who in his art and science and polity completely establishes the will of nature. Oken, it is true, conceived man as the sole object of all animal development, so that the lower stages are only abortive attempts to produce him-a theory afterward controverted by Ernst von Baer and Cuvier, the former of whom, standing somewhat in opposition to Darwin, is of great interest to the student of the history of the theory of evolution.

Some evolutionistic ideas are found in Krause and Schleiermacher; but Hegel, with his absolute idealism, is a more notable representative of them. In his system philosophy is the science of the Absolute, of the absolute reason developing or unfolding itself. Reason develops itself first in the abstract element of thought, then expresses itself externally in nature, and finally returns from this externalization into itself in mind. As Heraclitus had taught eternal becoming, so Hegel, who avowedly accepted all the propositions of the Ephesian philosopher in his logic, taught eternal proceeding. The difference between the Greek and the German was that the former believed in the flux of matter, of fire transmuting itself by degrees into all things, and in nature as the sole existence, outside of which there was nothing; while the latter conceived the abstract idea or reason as that which really is or becomes, and nature as only a necessary but transient phase in the process of development. With Heraclitus evolution meant the return of all things into the primal principle followed by a new world-development; with Hegel it was an eternal process of thought, giving no answer to the question as to the end of historical development.

DARWIN'S VIEW. While Heraclitus had laid down his doctrine of eternal becoming rather by intuition than on the ground of experience, and the entire evolutionary process of Hegel had been expressly conceived as based on pure thought, Darwin's epoch-making doctrine rested upon a vast mass of ascertained facts. He was, of course, not the first to lay down the origin of species one from another as a formal doctrine. Besides those predecessors of his to whom allusion has already been made, two others may be mentioned here: his father, Erasmus Darwin, who emphasized organic variability; and still more Lamarck, who denied the immutability of species and forms, and claimed to have demonstrated by observation the gradual development of the animal kingdom. What is new in Charles Darwin is not his theory of descent, but its confirmation by the theory of natural selection and the survival of the fittest in the struggle for existence. Thus a result is brought about which corresponds as far as possible to a rational end in a purely mechanical process, without any cooperation of teleological principles, without any innate tendency in the organisms to proceed to a higher stage. This theory postulates in the later organisms deviations from the earlier

ones; and that these deviations, in so far as they are improvements, perpetuate themselves and become generic marks of differentiation. This, however, imports a difficulty, since the origin of the first of these deviations is inexplicable. The differentia of mankind, whom Darwin, led by the force of analogy, deduces from a species of apes, consists in intellect and moral qualities, but comes into existence only by degrees. The moral sensibilities develop from the original social impulse innate in man; this impulse is an effort to secure not so much individual happiness as the general welfare.

It would be impossible to name here all those who, in different countries, have followed in Darwin's footsteps, first in the biological field and then in those of psychology, ethics, sociology, and religion. They have carried his teaching further in several directions, modifying it to some extent and making it fruitful, while positivism has not seldom come into alliance with it. In Germany Ernst Haeckel must be mentioned with his biogenetic law, according to which the development of the individual is an epitome of the history of the race, and with his less securely grounded notion of the world-ether as a creative deity. In France Alfred Fouillee worked out a theory of idea-forces, a combination of Platonic idealism with English (though not specifically Darwinian) evolutionism. Marie-Jean Guyau understood by evolution a life led according to the fundamental law that the most intensive life is also the most extensive. He develops his ethics altogether from the facts of the social existence of mankind, and his religion is a universal sociomorphism, the feeling of the unity of man with the entire cosmos.

SPENCER'S VIEW. The most careful and thorough development of the whole system took place in England. For a long time it was represented principally by the work of Herbert Spencer, who had come out for the principle of evolution even before the publication of *Darwin's Origin of Species*. He carries the idea through the whole range of philosophy in his great *System of Synthetic Philosophy* and undertakes to show that development is the highest law of all nature, not merely of the organic. As the foundation of ill that exists, though itself unknowable and only revealing itself in material and mental forms, he places a power, the Absolute, of which we have but an indefinite conception. The individual processes of the world of phenomena are classed under the head of evolution, or extension of movement, with which integration of matter, union into a single whole, is connected, and dissolution or absorption of movement, which includes disintegration of matter, the breaking of connection. Both processes go on simultaneously, and include the history of every existence which we can perceive. In the course of their development the organisms incorporate matter with themselves; the plant grows by taking into itself elements which have previously existed in the form of gases, and the animal by assimilating elements found in plants and in other animals. The same sort of integration is observed in social organisms, as when nomadic families unite into a tribe, or subjects under a prince, and princes under a king. In like manner integration is evident in the development of language, of art, and of science, especially philosophy. But as the individuals unite into a whole, a strongly marked differentiation goes on at the same time, as in the distinction between the surface and the interior of the earth, or between various climates. Natural selection is not considered necessary to account for varying species, but gradual conditions of life create them. The aim of the development is to show a condition of perfect balance in the whole; when this is attained, the development, in virtue of the continuous operation of external powers, passes into dissolution. Those epochs of development and of dissolution follow alternately upon each other. This view of Spencer suggests the *hodos ano* and *hodos kato* of Heraclitus, and his flowing back of individual things into the primal principle.

Similar principles are carried out not only for organic phenomena but also for mental and social; and on the basis of the theory of evolution a remarkable combination of intuitionism and

empiricism is achieved. In his principles of sociology Spencer lays down the laws of hyperorganic evolution, and gives the various stages of human customs and especially of religious ideas, deducing all religion much too one-sidedly from ancestor-worship. The belief in an immortal " second self " is explained by such phenomena as shadows and echoes. The notion of gods is suppose to arise from the idea of a ghostly life after death. In his *Principles of Ethics* he attempts a similar compromise between intuitionism and empiricism, deducing the consciousness of duty from innumerable accumulated experiences. The compelling element in moral actions, originally arising from fear of religious, civil, or social punishment, disappears with the development of true morality. There is no permanent opposition between egoism and altruism, but the latter develops simultaneously with the former.

Spencer's ethical principles were fruitfully modified, especially by Sir Leslie Stephen and S. Alexander, though with constant adherence to the idea of development. While the doctrine of evolution in Huxley and Tyndall is associated with agnosticism, and thus freed from all connection with metaphysics, as indeed was the case with Spencer, in spite of his recognition of the Absolute as the necessary basis for religion and for thought, in another direction an attempt was made to combine evolutionism closely with a metaphysics in which the idea of God was prominent. Thus the evolution theory of Clifford and Romanes led them to a thoroughgoing monism, and that of J. M. F. Schiller to pluralism. According to the last-named a personal deity, limited in power, exists side by side with a multitude of intellectual beings, who existed before the formation of the world in a chaotic state as absolutely isolated individuals. The process of world formation begins with the decision of the divine Spirit to bring a harmony of the cosmos out of these many existences. Though Spencer's influence in philosophical development was not so great in Germany as in England, the idea of development has continued in recent years to exert no little power. Space forbids more than a mention of Lotze's teleological idealism; Von Harttmann's absolute monism, in which the goal of the teleological development of the universe is the reversion of the will into not-willing; Wundt's metaphysics of the will, according to which the world is a development, an eternal becoming, in which nature is a preliminary stage to mind; and Nietzsche's individualism, the final point of which is the development of the superman.

Experience

The term "experience" refers to information obtained externally by means of the senses or internally through emotion. The term a posteriori is often used interchangeably with experience. An individual gains experience both through second hand reports of testimonies from others, and from first hand acquaintance. A single impression at a distinct moment in time is not itself an experience; instead experience involves a series of events from the past which are actual in one's memory and are included in a present situation. Experience is often divided between the internal and external. Internal experience is related to an individual's own mental events, while external experience is thought to be distinct an individual's consciousness. However, this distinction is confusing because some experiences can fall into both categories, such as aesthetic experiences.

To say that an individual experiences an object presupposes that the object really exists. However, philosophers use "experience" to refer only to how an event relates to a person.

Plato disliked the notion of experience since it is only a step to understanding universals. Further, it is unreliable because the observer can be deceived by the senses, such as when an observer sees railroad tracks that seem to cross when in reality they are always parallel to one another. This suggests that experience is a product of the mind and that part of an experience can be subject to misinterpretation or interference. This occurs even when an individual does not invent an experience or deliberately change it.

An immediate and interrupted experience is referred to as the "given." There is disagreement as to the characteristics of the given. Three main theories are that (1) it is private, (2) that an experience is reduced to its most basic element, and (3) that it cannot be improved upon. These are not sufficient conditions for givenness, but they are necessary. The problem with the given is understanding the dividing line between inference and actual experience. Direct realists claim that there is no difference between immediate experience and interpreted experience: things are exactly as they appear to us. Therefore, to the direct realist, there is no problem of knowledge. William James used the term "Empiriocriticism" to define the given without assumptions. Both James and F.H. Bradley hold that immediate experience is a combination of feelings and sensations in which a subject/object distinction has not even begun.

Empiricists typically resist describing experience as purely mental. However, secondary qualities such as color, taste, and sound involve some individual mental interpretation. Rationalists claim that developed experience comes from the mind *a priori* instead of through interpretation of the given. It is only through logic that the mind can understand the experience. Kant takes a middle position maintaining that experience is a synthesis of the given and the made (interpreted experience).

Theories of Explanation

This article focuses on the way, within the philosophy of science, thinking about explanation has changed over the last 50 years. It begins by discussing the philosophical concerns that gave rise to the first theory of explanation. It then discusses this theory -- the deductive-nomological model -- and standard criticisms of it, followed by an examination of attempts to amend, extend or replace this model. This article particularly emphasizes the extent to which these later developments reflect the priorities and presuppositions of different philosophical traditions. This article emphasizes the most general aspects of explanation. There are many important aspects of explanation that it does not cover. Notably, it does not discuss the relation between the different types of explanation - e.g., teleological , functional, reductive, psychological, and historical explanation -- that are employed in various branches of human inquiry.

Introduction

Most people, philosophers included, think of explanation in terms of causation. Very roughly, to explain an event or phenomenon is to identify its cause. The nature of causation is one of the perennial problems of philosophy, so on the basis of this connection one might reasonably attempt to trace thinking about the nature of explanation to antiquity. (Among the ancients, for example, Aristotle's theory of causation is plausibly regarded as a theory of explanation.) But the idea that the concept of explanation warrants independent analysis really did not begin to take hold until the 20th century. Generally, this change occurred as the result of the linguistic turn in philosophy. More specifically, it was the result of philosophers of science attempting to understand the nature of modern theoretical science.

Of particular concern were theories that posited the existence of unobservable entities and processes (e.g., atoms, fields, genes, etc.). These posed a dilemma. On the one hand, the staunch empiricist had to reject unobservable entities as a matter of principle; on the other hand, theories that appealed to unobservables were clearly producing revolutionary results. A way was needed to characterize the obvious value of these theories without abandoning the empiricist principles deemed central to scientific rationality.

In this context it became common to distinguish between the literal truth of a theory and its power to explain observable phenomena. Although the distinction between truth and explanatory power is important, it is susceptible to multiple interpretations, and this remains a source of confusion even today. The problem is this: In philosophy the terms "truth" and "explanation" have both realist and epistemic interpretations. On a realist interpretation the truth and explanatory power of a theory are matters of the correspondence of language with an external reality. A theory that is both true and explanatory gives us insight into the causal structure of the world. On an epistemic interpretation, however, these terms express only the power of a theory to order our experience. A true and explanatory theory orders our experience to a greater degree than a false non-explanatory one. Hence, someone who denies that scientific theories are explanatory in the realist sense of the term may or may not be denying that they are explanatory in the epistemic sense. Conversely, someone who asserts that scientific theories are explanatory in the epistemic sense may or may not be claiming that they are explanatory in the realist sense. The failure to distinguish these senses of "explanation" can and does foster disagreements that are purely semantic in nature.

One common way of employing the distinction between truth and explanation is to say that theories that refer to unobservable entities may explain the phenomena, but they are not literally true. A second way is to say that these theories are true, but they do not really explain the phenomena. Although these statements are superficially contradictory, they can both be made in support of the same basic view of the nature of scientific theories. This, it is now easy to see, is because the terms 'truth' and 'explanation' are being used differently in each statement. In the first, 'explanation' is being used epistemically and 'truth' realistically; in the second, 'explanation' is being used realistically and 'truth' epistemically. But both statements are saying roughly the same thing, namely, that a scientific theory may be accepted as having a certain epistemic value without necessarily accepting that the unobservable entities it refers to

actually exist. (This view is known as anti-realism.) One early 20th century philosopher scientist, Pierre Duhem, expressed himself according to the latter interpretation when he claimed:

A physical theory is not an explanation. It is a system of mathematical propositions, deduced from a small number of principles, which aim to represent as simply, as completely, and as exactly as possible a set of experimental laws. ([1906] 1962: p7)

Duhem claimed that:

> **To explain is to strip the reality of the appearances covering it like a veil, in order to see the bare reality itself. (op.cit.: p19)**

Explanation was the task of metaphysics, not science. Science, according to Duhem, does not comprehend reality, but only gives order to appearance. However, the subsequent rise of analytic philosophy and, in particular, logical positivism made Duhem's acceptance of classical metaphysics unpopular. The conviction grew that, far from being explanatory, metaphysics was meaningless insofar as it issued claims that had no implications for experience. By the time Carl Hempel (who, as a logical positivist, was still fundamentally an anti-realist about unobservable entities) articulated the first real theory of explanation (1948) the explanatory power of science could be stipulated.

To explain the phenomena in the world of our experience, to answer the question "Why?" rather than only the question "What?", is one of the foremost objectives of all rational inquiry; and especially scientific research, in its various branches strives to go beyond a mere description of its subject matter by providing an explanation of the phenomena it investigates. (Hempel and Oppenheim 1948: p8)

For Hempel, answering the question "Why?" did not, as for Duhem, involve an appeal to a reality beyond all experience. Hempel employs the epistemic sense of explanation. For him the question "Why?" was an expression of the need to gain predictive control over our future experiences, and the value of a scientific theory was to be measured in terms of its capacity to produce this result.

Hempel's Theory of Explanation

According to Hempel, an explanation is:

> **...an argument to the effect that the phenomenon to be explained ...was to be expected in virtue of certain explanatory facts. (1965 p. 336)**

Hempel claimed that there are two types of explanation, what he called 'deductive-nomological' (DN) and 'inductive-statistical' (IS) respectively." Both IS and DN arguments have the same structure. Their premises each contain statements of two types: (1) initial conditions C, and (2) law-like generalizations L. In each, the conclusion is the event E to be explained:

> **C1, C2, C3,...Cn**
>
> **L1, L2, L3,...Ln**
>
> **-----------------------**
>
> **E**

The only difference between the two is that the laws in a DN explanation are universal generalizations, whereas the laws in IS explanations have the form of statistical generalizations. An example of a DN explanation containing one initial condition and one law-like generalization is:

> **C. The infant's cells have three copies of chromosome 21.**
>
> **L. Any infant whose cells have three copies of chromosome 21 has Down's Syndrome.**
>
> **---**
>
> **E. The infant has Down's Syndrome.**

An example of an IS explanation is:

C. The man's brain was deprived of oxygen for five continuous minutes.

L. Almost anyone whose brain is deprived of oxygen for five continuous minutes will sustain brain damage.

--

E. The man has brain damage.

For Hempel, DN explanations were always to be preferred to IS explanations. There were two reasons for this.

First, the deductive relationship between premises and conclusion maximized the predictive value of the explanation. Hempel accepted IS arguments as explanatory just to the extent that they approximated DN explanations by conferring a high probability on the event to be explained.

Second, Hempel understood the concept of explanation as something that should be understood fundamentally in terms of logical form. True premises are, of course, essential to something being a good DN explanation, but to qualify as a DN explanation (what he sometimes called a potential DN explanation) an argument need only exhibit the deductive-nomological structure. (This requirement placed Hempel squarely within the logical positivist tradition, which was committed to analyzing all of the epistemically significant concepts of science in logical terms.) There is, however, no corresponding concept of a potential IS explanation. Unlike DN explanations, the inductive character of IS explanations means that the relation between premises and conclusion can always be undermined by the addition of new information. (For example, the probability of brain damage, given that a man is deprived of oxygen for 7 minutes, is lowered somewhat by the information that the man spent this time at the bottom of a very cold lake.) Consequently, it is always possible that a proposed IS explanation, even if the premises are true, would fail to predict the fact in question, and thus have no explanatory significance for the case at hand.

Standard Criticisms of Hempel's Theory of Explanation

Hempel's dissatisfaction with statistical explanation was at odds with modern science, for which the explanatory use of statistics had become indispensable. Moreover, Hempel's requirement that IS explanations approximate the predictive power of DN explanations has the counterintuitive implication that for inherently low probability events no explanations are possible. For example, since smoking two packs of cigarettes a day for 40 years does not actually make it probable that a person will contract lung cancer, it follows from Hempel's theory that a statistical law about smoking will not be involved in an IS explanation of the occurrence of lung cancer. Hempel's view might be defended here by claiming that when our theories do not allow us to predict a phenomenon with a high degree of accuracy, it is because we have incomplete knowledge of the initial conditions. However, this seems to require us to base a theory of explanation on the now dubious metaphysical position that all events have determinate causes.

Another important criticism of Hempel's theory is that many DN arguments with true premises do not appear to be explanatory. Wesley Salmon raised the problem of relevance with the following example:

C1. Butch takes birth control pills.

C2: Butch is a man.

L: No man who takes birth control pills becomes pregnant.

--

E: Butch has not become pregnant.

Unfortunately, this reasoning qualifies as explanatory on Hempel's theory despite the fact that the premises seem to be explanatorily irrelevant to the conclusion.

Sylvain Bromberger raised the problem of asymmetry by pointing out that, while on Hempel's model one can explain the period of a pendulum in terms of the length of the pendulum together with the law of simple periodic motion, one can just as easily explain the length of a pendulum in terms of its period in accord with the same law. Our intuitions tell us that

the first is explanatory, but the second is not. The same point is made by the following example:

> **C: The barometer is falling rapidly.**
>
> **L: Whenever the barometer falls rapidly, a storm is approaching.**
>
> **---**
>
> **E: A storm is approaching.**

While the falling barometer is a trustworthy indicator of an approaching storm, it is counterintuitive to say that the barometer explains the occurrence of the storm. Rather, it is the approaching storm that explains the falling barometer.

These two problems, relevance and asymmetry, expose the difficulty of developing a theory of explanation that makes no reference to causal relations. Reference to causal relations is not an option for Hempel, however, since causation heads the anti-realist's list of metaphysically suspect concepts. It would also undermine his view that explanation should be understood as an epistemic rather than a metaphysical relationship. Hempel's response to these problems was that they raise purely pragmatic issues. His model countenances many explanations that prove to be useless, but whether an explanation has any practical value is not, in Hempel's view, something that can be determined by philosophical analysis. This is a perfectly cogent reply, but it has not generally been regarded as an adequate one. Virtually all subsequent attempts to improve upon Hempel's theory accept the above criticisms as legitimate.

As noted above, Hempel's model requires that an explanation make use of at least one law-like generalization. This presents another sort of problem for the DN model. Hempel was careful to distinguish law-like generalizations from accidental generalizations. The latter are generalizations that may be true, but not in virtue of any law of nature. (E.g., "All of my shirts are stained with coffee" may be true, but it is- I hope- just an accidental fact, not a law of nature.) Although the idea that explanation consists in subsuming events under natural laws has wide appeal in the philosophy of science, it is doubtful whether this requirement can be made consistent with Hempel's epistemic view of explanation. The reason is simply that no one has ever articulated an epistemically sound criterion for distinguishing between law-like generalizations and accidental generalizations. This is essentially just Hume's problem of induction, viz., that no finite number of observations can justify the claim that a regularity in nature is due to an natural necessity. In the absence of such a criterion, Hempel's model seems to violate the spirit of the epistemic view of explanation, as well as the idea that explanation can be understood in purely logical terms.

Contemporary Developments in the Theory of Explanation

Contemporary developments in the theory of explanation in many ways reflect the fragmented state of analytic philosophy since the decline of logical positivism. In this article we will look briefly at examples of how explanation has been conceived within the following five traditions: (1) Causal Realism, (2) Constructive Empiricism, (3) Ordinary Language Philosophy, (4) Cognitive Science and (5) Naturalism and Scientific Realism.

(1) Explanation and Causal Realism

With the decline of logical positivism and the gathering success of modern theoretical science, philosophers began to regard continued skepticism about the reality of unobservable entities and processes as pointless. Different varieties of realism were articulated and against this background several different causal theories of explanation were developed. The idea behind them is the ordinary intuition noted at the beginning of this essay: to explain is to attribute a cause. Michael Scriven argued this point with notable force:

Let us take a case where we can be sure beyond any reasonable doubt that we have a correct explanation. As you reach for the dictionary, your knee catches the edge of the table and thus turns over the ink bottle, the contents of which proceed to run over the table's edge and ruin the carpet. If you are subsequently asked to explain how the carpet was damaged you have a complete explanation. You did it by knocking over the ink. The certainty of this explanation is primeval...This capacity for identifying causes is learnt, is better developed in some people than in others, can be tested, and is the basis for what we call judgements. (1959a: p. 456)

Wesley Salmon's causal theory of explanation is perhaps the most influential developed within the realist tradition. Salmon had earlier developed a fundamentally epistemic view according to which an explanation is a list of statistically relevant factors. However he later rejected this, and any epistemic theory, as inadequate. His reason was that all epistemic theories are incapable of showing how explanations produce scientific understanding. This is because scientific understanding is not only a matter of having justified beliefs about the future. Salmon now insists that even a Laplacean Demon whose knowledge of the laws and initial conditions of the universe were so precise and complete as to issue in perfect predictive knowledge would lack scientific understanding. Specifically, he would lack the concepts of causal relevance and causal asymmetry and he could not distinguish between true causal processes and pseudoprocesses. (As an example of the latter, consider the beam of a search light as it describes an arc through the sky. The movement of the beam is a pseudoprocess since earlier stages of the beam do not cause later stages. By contrast, the electrical generation of the light itself, and the movement of the lamp housing are true causal processes.)

Salmon defends his causal realism by rejecting the Humean conception of causation as linked chains of events, and by attempting to articulate an epistemologically sound theory of continuous causal processes and causal interactions to replace it. The theory itself is detailed and does not lend itself to compression. It reads not so much as an analysis of the term 'explanation' as a set of instructions for producing an explanation of a particular phenomenon or event. One begins by compiling a list of statistically relevant factors and analyzing the list by a variety of methods. The procedure terminates in the creation of causal models of these statistical relationships and empirical testing to determine which of these models is best supported by the evidence.

Insofar as Salmon's theory insists that an adequate explanation has not been achieved until the fundamental causal mechanisms of a phenomenon have been articulated, it is deeply reductionistic. It is not clear, for example, how Salmon's model of explanation could ever generate meaningful explanations of mental events, which supervene on, but do not seem to be reducible to a unique set of causal relationships. Salmon's theory is also similar to Hempel's in at least one sense, and that is that both champion ideal forms of explanation, rather than anything that scientists or ordinary people are likely to achieve in the workaday world. This type of theorizing clearly has its place, but it has also been criticized by those who see explanation primarily as a form of communication between individuals. On this view, simplicity and ease of communication are not merely pragmatic, but essential to the creation of human understanding.

(2) Explanation and Constructive Empiricism

In his book *The Scientific Image* (1980) Bas van Fraassen produced an influential defense of anti-realism. Terming his view "constructive empiricism" van Fraassen claimed that theoretical science was properly construed as a creative process of model construction rather than one of discovering truths about the unobservable world. While avoiding the fatal excesses of logical positivism he argued strongly against the realistic interpretation of theoretical terms, claiming that contemporary scientific realism is predicated on a dire misunderstanding of the nature of explanation. (See "Naturalism and Scientific Realism" below). In support of his constructive empiricism van Fraassen produced an epistemic theory of explanation that draws on the logic of why-questions and draws on a Bayesian interpretation of probability.

Like Hempel, van Fraassen seeks to explicate explanation as a purely logical concept. However, the logical relation is not that of premises to conclusion, but one of question to answer. Following Bromberger, van Fraassen characterizes explanation as an answer to a why-question. Why-questions, for him, are essentially contrastive. That is, they always, implicitly or explicitly, ask: Why Pk, rather than some set of alternatives X=<P1...Pn>? Why-questions also implicitly stipulate a relevance relation R, which is the explanatory relation (e.g., causation) any answer must bear to the ordered pair <Pk,X>.

van Frassen follows Hempel in addressing explanatory asymmetry and explanatory relevance as pragmatic issues. However, van Fraassen's question-answering model makes this view a bit more intuitive. The relevance relation is defined by the interests of the person posing the question. For example, an individual who asks for an explanation of an airline accident in terms of the human decisions that led to it can not be forced to accept an explanation solely in terms of the weather. van Fraassen deals with the problem of explanatory asymmetry by showing that this, too, is a function of context. For example, most people would say that bad weather explains plane crashes, but plane crashes don't explain bad weather. However, there are conditions (e.g., unstable atmospheric conditions, an airplane carrying highly explosive cargo) that could combine to supply the latter explanation with an appropriate context.

van Fraassen's model also avoids Hempel's problematic requirement of high probability for IS explanation. For van Fraassen, an answer will be potentially explanatory if it "favors" Pk over all the other members of the contrast class. This means roughly that the answer must confer greater probability on Pk than on any other Pi. It does not require that Pk actually be probable, or even that the probability of Pk be raised as a result of the answer, since favoring can actually result from an answer that lowers the probability of all other Pi relative to Pk. For van Fraassen, the essential tool for calculating the explanatory value of a theory is Bayes' Rule, which allows one to calculate the probability of a particular event relative to a set of background asssumptions and some new information. From a Bayesian point of view, the rationality of a belief is relative to a set of background assumptions which are not themselves the subject of evaluation. van Fraassen's theory of explanation is therefore deeply subjectivist: what counts as a good explanation for one person may not count as a good explanation for another, since their background assumptions may differ.

van Fraassen's pragmatic account of explanation buttresses his anti-realist position, by showing that when properly analyzed there is nothing about the concept of explanation that demands a realistic interpretation of causal processes or unobservables. van Fraassen does not make the positivist mistake of claiming that talk of such things is metaphysical nonsense. He claims only that a full appreciation of science does not depend on a realistic interpretation. His pragmatism also offers an alternative account of Salmon's Laplacean Demon. van Fraassen agrees with Salmon that an individual with perfect knowledge of the laws and initial conditions of the universe lacks something, but what he lacks is not objective knowledge of the difference between causal processes and pseudo processes. Rather, he simply lacks the human interests that make causation a useful concept.

(3) Explanation and Ordinary Language Philosophy

Although van Fraassen's theory of explanation is based on the view that explanation is a process of communication, he still chooses to explicate the concept of explanation as a logical relationship between question and answer, rather than as a communicative relationship between two individuals. Ordinary Language Philosophy tends to emphasize this latter quality, rejecting traditional epistemology and metaphysics and focussing on the requirements of effective communication. For this school, philosophical problems do not arise because ordinary language is defective, but because we are in some way ignoring the communicative function of language. Consequently, the point of ordinary language analysis is not to improve upon ordinary usage by clarifying the meanings of terms for use in some ideal vocabulary, but rather to bring the full ordinary meanings of the terms to light.

Within this tradition Peter Achinstein (1983) developed an illocutionary theory of explanation. Like Salmon, Achinstein characterizes explanation as the pursuit of understanding. He defines the act of explanation as the attempt by one person to produce understanding in another by answering a certain kind of question in a certain kind of way. Achinstein rejects Salmon's narrow association of understanding with causation, as well as van Fraassen's analysis in terms of why-questions. For Achinstein there are many different kinds of questions that we ordinarily regard as attempts to gain understanding (e.g., who-, what-, when-, and where-questions) and it follows that the act of answering any of these is properly regarded as an act of explanation.

According to Achinstein's theory S (a person) explains q (an interrogative expressing some question Q) by uttering u only if:

S utters u with the intention that his utterance of u render q understandable by producing the knowledge of the proposition expressed by u that it is a correct answer to Q. (1983: p.13)

Achinstein's approach is an interesting departure from the types of theory discussed above in that it draws freely both on the concept of intention as well as the irreducibly causal notion of "producing knowledge." This move clearly can not be countenanced by someone who sees explanation as a fundamentally logical concept. Even the causal realist who believes that explanations make essential reference to causes does not construe explanation itself in causal terms. Indeed, Achinstein's approach is so different from theories that we have discussed so far that it might be best construed as addressing a very different question. Whereas traditional theories have attempted to explicate the logic of explanation, Achinstein's theory may be best understood as an attempt to describe the process of explanation itself.

Like van Fraassen's theory, Achinstein's theory is deeply pragmatic. He stipulates that all explanations are given relative to a set of instructions (cf. van Fraassen's relevance relations) and indicates that these instructions are ultimately determined by the individual asking the question. So, for example, a person who ask for an explanation why the electrical power in the house has gone out implicitly instructs that the question be answered in a way that would be relevant to the

goal of turning the electricity back on. An answer that explained the absence of an electrical current in scientific terms, say by reference to Maxwell's equations, would be inappropriate in this case.

Achinstein attempts to avoid van Fraassen's subjectivism, by identifying understanding with knowledge that a certain kind of proposition is true. These, he calls "content giving propositions" which are to be contrasted with propositions that have no real cognitive significance. For example, Achinstein would want to rule out as non-explanatory, answers to questions that are purely tautological, such as: Mr. Pheeper died because Mr. Pheeper ceased to live. Achinstein also counts as non explanatory the scientifically correct answer to a question like: What is the speed of light in a vacuum? For him 186,000 miles/ second is not explanatory because, as it stands, it is just an incomprehensibly large number offering no basis of comparison with velocities that are cognitively significant. This does not mean that speed of light in a vacuum can not be explained. For example, a more cognitively significant answer to the above question might be that light can travel 7 1/2 times around the earth in one second. (Thanks to Professor Norman Swartz for this example)

One of the main difficulties with Achinstein's theory is that the idea of a content-giving proposition remains too vague. His refusal to narrow the list of questions that qualify as requests for explanation makes it very difficult to identify any interesting property that an act of explanation must have in order to produce understanding. Moreover, Achinstein's theory suffers from epistemological problems of its own. His theory of explanation makes essential reference to the intention to produce a certain kind of knowledge-state, but it is unclear from what Achinstein says how a knowledge state can be the result of an illocutionary act simpliciter. Certainly, such acts can produce beliefs, but not all beliefs so produced will count as knowledge, and Achinstein's theory does not distinguish between the kinds of explanatory acts that are likely to result in such knowledge, and the kinds that will not.

(4) Explanation and Cognitive Science

While explanation may be fruitfully regarded as an act of communication, still another departure from the standard relational analysis is to think of explaining as a purely cognitive activity, and an explanation as a certain kind of mental representation that results from or aids in this activity. Considered in this way, explaining (sometimes called 'abduction') is a universal phenomenon. It may be conscious, deliberative, and explicitly propositional in nature, but it may also be unconscious, instinctive, and involve no explicit propositional knowledge whatsoever. For example: a father, hearing a high-pitched wail coming from the next room, rushes to his daughter's aid. Whether he reacted instinctively, or on the basis of an explicit inference, we can say that the father's behavior was the result of his having explained the wailing sound as the cry of his daughter.

From this perspective the term 'explanation' is neither a metalogical nor a metaphysical relation. Rather, the term has been given a theoretical status and an explanatory function of its own; i.e., we explain a person's behavior by reference to the fact that he is in possession of an explanation. Put differently, 'explanation' has been subsumed into the theoretical vocabulary of science (with explanation itself being one of the problematic unobservables) an understanding of which was the very purpose of the theory of explanation in the first place.

Cognitive science is a diverse discipline and there are many different ways of approaching the concept of explanation within it. One major rift within the discipline concerns the question whether "folk psychology" with its reference to mental entities like intentions, beliefs and desires is fundamentally sound. Cognitive scientists in the artificial intelligence (AI) tradition argue that it is sound, and that the task of cognitive science is to develop a theory that preserves the basic integrity of belief-desire explanation. On this view, explaining is a process of belief revision, and explanatory understanding is understood by reference to the set of beliefs that result from that process. Cognitive scientists in the neuroscience tradition, in contrast, argue that folk psychology is not explanatory at all: in its completed state all reference to beliefs and desires will be eliminated from the vocabulary of cognitive science in favor of a vocabulary that allows us to explain behavior by reference to models of neural activity. On this view explaining is a fundamentally neurological process, and explanatory understanding is understood by reference to activation patterns within a neural network.

One popular approach that incorporates aspects of both traditional AI and neuroscience makes use of the idea of a mental model (cf. Holland et al. [1986]) Mental models are internal representations that occur as a result of the activation of some part of a network of condition-action (or if-then) type rules. These rules are clustered in such a way that when a certain number of conditions becomes active, some action results. For example, here is a small cluster of rules that a simple cognitive system might use to distinguish different types of small furry mammals in a backyard environment.

(i) If <large, scurries, meows> then <cat>.

(ii) If <small, scurries, squeaks> then <rat>.

(iii) If <small, hops, chirps> then <squirrel>.

(iv) If <squirrel or rat> then <flees>.

(v) If <cat> then <approaches>.

A mental model of a squirrel, then, can be described as an activation of rule (iii).

A key concept within the mental models framework is that of a default hierarchy. A set of rules such as those above, state a standard set of default conditions. When these are met, a set of expectations is generated. For example, the activation of rule (iii) generates expectations of type (iv). However, a viable representational system must be able to revise prior rule activations when expectations are contradicted by future experience. In the mental models framework, this is achieved by incorporating a hierarchy of rules below the default condition with more specific conditions at lower levels of the model whose actions will defeat default expectations. For example, default rule (iii) might be defeated by another rule as follows:

3. Level 1: If <small, hops, chirps> then <squirrel>.

Level 2: If <flies> then <bird>.

In other words, a system that identifies a small, hopping chirping animal as a squirrel generates a set of expectations about its future behavior. If these expectations are contradicted by, for example, the putative squirrel flying, then the system will descend to a lower level of the hierarchy thereby allowing the system to reclassify the object as a bird.

Although this is just a cursory characterization of the mental models framework it is enough to show how explanation can be handled within it. In this context it is natural to think of explanation as a process that is triggered by a predictive failure. Essentially, when the expectations activated at Level 1 of the default hierarchy fail, the system searches lower levels of the hierarchy to find out why. If the above example were formulated in explicitly propositional terms, we would say that the failure of Level 1 expectations generated the question: Why did the animal, which I previously identified as a squirrel, fly? The answer supplied at level 2 is: Because the animal is not a squirrel, but a bird. Of course, Level 2 rules produce their own set of expectations, which must themselves be corroborated with future experience or defeated by future explanations. Clearly, the above example is a rudimentary form of explanation. Any viable system must incorporate learning algorithms which allow it to modify both the content and structure of the default hierarchy when its expectations are repeatedly undermined by experience. This will necessarily involve the ability to generalize over past experiences and activate entirely new rules at every level of the default hierarchy.

One can reasonably doubt whether philosophical questions about the nature of explanation are addressed by defining and ultimately engineering systems capable of explanatory cognition. To the extent that these questions are understood in purely normative terms, they obviously arise in regard to systems built by humans with at least as much force as they arise for humans themselves. In defense of the cognitive science approach, however, one might assert that the simple philosophical question "What is explanation?" is not well-formed. If we accept some form of epistemic relativity, the proper form of such a question is always "What is explanation in cognitive system S?" Hence, doubts about the significance of explanatory cognition in some system S are best expressed as doubts about whether system S-type explanation models human cognition accurately enough to have any real significance for human beings.

(5) Explanation, Naturalism and Scientific Realism

Historically, naturalism is associated with the inclination to reject any kind of explanation of natural phenomena that makes essential reference to unnatural phenomena. Insofar as this view is understood simply as the rejection of *supernatural* phenomena (e.g. the actions of gods, irreducibly spiritual substances, etc.) it is uncontroversial within the philosophy of science. However, when it is understood to entail the rejection of irreducibly *non-natural* properties, (i.e., the normative properties of 'rightness' and 'wrongness' that we appeal to in making evaluative judgments about human thought and behavior), it is deeply problematic. The problem is just that the aim of the philosophy of science has always been to establish an *a priori* basis for making precisely these evaluative judgments about scientific inquiry itself. If they can not be made, then it follows that the goals of philosophical inquiry have been badly misconceived.

Most contemporary naturalists do not regard this as an insurmountable problem. Rather, they just reject the idea that

philosophical inquiry can occur from a vantage point outside of science, and they deny that evaluative judgments we make about scientific reasoning and scientific concepts have any *a priori* status. Put differently, they think philosophical inquiry should be seens as a very abstract form of scientific inquiry, and they see the normative aspirations of philosophers as something that must be achieved by using the very tools and methods that philosophers have traditionally sought to justify.

The relevance of naturalism to the theory of explanation can be understood briefly as follows. Naturalism undermines the idea that knowledge is prior to understanding. If it is true that there will never be an inductive logic that can provide an *a priori* basis for calling an observed regularity a natural law, then there is, in fact, no independent way of establishing what is the case prior to understanding why it is the case. Because of this, some naturalists (e.g., Sellars) have suggested a different way of thinking about the epistemic significance of explanation. The idea, basically, is that explanation is not something that occurs on the basis of pre-confirmed truths. Rather, successful explanation is actually part of the process of confirmation itself:

Our aim [is] to manipulate the three basic components of a world picture: (a) observed objects and events, (b) unobserved objects and events, (c) nomological connections, so as to achieve a maximum of 'explanatory coherence'. In this reshuffle no item is sacred. (Sellars, 1962: p356)

Many naturalists have since embraced this idea of "inference to the best explanation" (IBE) as a fundamental principle of scientific reasoning. Moreover, they have put this principle to work as an argument for realism. Briefly, the idea is that if we treat the claim that unobservable entities exist as a scientific hypothesis, then it can be seen as providing an explanation of the success of theories that employ them: viz., the theories are successful because they are (approximately) true. Anti-realism, by contrast, can provide no such explanation; on this view theories that make reference to unobservables are not literally true and so the success of scientific theories remains mysterious. It should be noted here that scientific realism has a very different flavor from the more foundational form of realism discussed above. Traditional realists do not think of realism as a scientific hypothesis, but as an independent metaphysical thesis.

Although IBE has won many converts in recent years it is deeply problematic precisely because of the way it employs the concept of explanation. While most people find IBE to be intuitively plausible, the fact remains that no theory of explanation discussed above can make sense of the idea that we accept a claim on the basis of its explanatory power. Rather, every such view stipulates as a condition of having explanatory power at all that a statement must be true or well-confirmed. Moreover, van Fraassen has argued that even if we can make sense of IBE, it remains a highly dubious principle of inductive inference. The reason is that "inference to the best explanation" really can only mean "inference to the best explanation given to date". We are unable to compare proposed explanations to others that no one has yet thought of, and for this reason the property of being the best explanation can not be an objective measure of the likelihood that it is true.

One way of responding to these criticisms is to observe that Sellars' concept of explanatory coherence is based on a view about the nature of understanding that simply eludes the standard models of explanation. According to this view an explanation increases our understanding, not simply by being the correct answer to a particular question, but by increasing the coherence of our entire belief system. This view has been developed in the context of traditional epistemology (Harman, Lehrer) as well as the philosophy of science (Thagard, Kitcher). In the latter context, the terms "explanatory unification" and "consilience" have been introduced to promote the idea that good explanations necessarily tend to produce a more unified body of knowledge. Although traditionalists will insist that there is no *a priori* basis for thinking that a unified or coherent set of beliefs is more likely to be true, (counterexamples are, in fact, easy to produce) this misses the point that most naturalists reject the possibility of establishing IBE, or any other inductive principle, on purely *a priori* grounds.

The Current State of the Theory of Explanation

This brief summary may leave the reader with the impression that philosophers are hopelessly divided on the nature of explanation, but this is not really the case. Most philosophers of science would agree that our understanding of explanation is far better now than it was in 1948 when Hempel and Oppenheim published "Studies in the Logic of Explanation." While it serves expository purposes to represent the DN model and each of its successors as fatally flawed, this should not obscure the fact that these theories have brought real advances in understanding which succeeding models are required to preserve. At this point, fundamental disagreements on the nature of explanation fall into one of two

categories. First, there are metaphysical disagreements. Realists and anti-realists continue to differ over what sort of ontological commitments one makes in accepting an explanation. Second, there are metaphilosophical disagreements. Naturalists and nonnaturalists remain at odds concerning the relevance of scientific inquiry (viz., inquiry into the way scientists, ordinary people and computers actually think) to a philosophical theory of explanation. These disputes are unlikely to be resolved anytime soon. Fortunately, however, the significance of further research into the logical and cognitive structure of explanation does not depend on their outcome.

External World

In philosophical discussions, the external world is the realm of objects outside and independent of an independent self. The external world can only be examined and known through sensory perceptions. It is presumed that the eternal world is a unified system, mirroring our unified perceptions. Skeptics argue that our knowledge is limited to our perceptions, thus there is no knowledge of this external world itself.

There are three traditional accounts of our perception of the external world. Direct realism, says that the physical world is as it is perceived. Representationalism holds that the external world causes our experiences, and that the object being perceived cannot exist outside of how it is perceived. For Russell, that nothing in the external world we perceive is what it seems. Phenomenalism is the view that all we know are phenomena, and we know nothing of the external things causing the phenomena.

For Hobbes the external world involves both the external movement of objects and the internal movements within the perceiver. Any change in these movements corresponds to an interaction, thus perception. Locke, Berkeley, and Mill held that sensations of the external world cannot be selected by the perceiver; only our ideas spawned from those perceptions can be selected and controlled.

The ability to comprehend the external world involves the ability to interpret, distinguish, and relate what seems to be singular things or, at least, singular groups of things. Comprehending the external world is a process of forming interconnections between these singular things.

Feminist Ethics

In recent years feminist thinkers have challenged traditional models of thinking in most academic disciplines. Feminists argue that conventional paradigms are male-oriented insofar as they are devised by men and are dominated by a male emphasis on systems of inflexible rules. Further, these paradigms are often self-serving for men and subversive to the interests of women. The term "feminist ethics" refers to a wide group feminist-related moral issues. One such issue involves the social and political oppression of women as has occurred during much of human history. Male philosophers have often argued that women are subordinate to men intellectually, socially, and even morally. For example, in Book 5 of *Émile* (1762), Jean Jacques Rousseau (1712-1778), argued that women serve mainly a supportive function in the lives of men and, accordingly, the education of women should reflect that function:

> A woman's education must therefore be planned in relation to man. To be pleasing in his sight, to win his respect and love, to train him in childhood, to tend him in manhood, to counsel and console, to make his life pleasant and happy, these are the duties of woman for all time, and this is what she should be taught while she is young. The further we depart from this principle, the further we shall be from our goal, and all our precepts will fail to secure her happiness or our own. [*Émile*, (London, 1911) p. 393]

Although views like Rousseau's are largely rejected today even by men, feminists point out that women continue to be oppressed as seen in the fact that men still occupy the top positions in politics, business, and finance. The goal of feminist ethics, on this view, is to create a plan or ideology that will end the social and political oppression of women.

A second central issue of feminist ethics focuses on two claims: (1) traditional morality is male-centered, and (2) there is a unique female perspective of the world that can be shaped into a value theory. Traditional morality is male-centered since it is modeled after practices that have been traditionally male-dominated, such as acquiring property, engaging in business contracts, and governing societies. The rigid systems of rules required for trade and government were then taken as models for the creation of equally rigid systems of moral rules, such as lists of rights and duties. Women, by contrast, have traditionally had a nurturing role by raising children and overseeing domestic life. These tasks require less rule following, and more spontaneous and creative action. Using the woman's experience as a model for moral theory, then, the basis of morality would be spontaneously caring for others as would be appropriate in each unique circumstance. On this model, the agent becomes part of the situation and acts caringly within that context. This stands in contrast to male-modeled morality where the agent is a mechanical actor who performs his required duty, but can remain distanced from and unaffected by the situation. A care-based approach to morality, as it is sometimes called, is offered by feminist ethicists as either a replacement for or a supplement to traditional male-modeled moral systems.

In her landmark book *A Vindication of the Rights of Woman* (1792), British political philosopher Mary Wollstonecraft (1759-1797) attacks traditional male preconceptions of the nature and social role of women. Reason, she argues, "loudly demands justice for one-half of the human race." According to Wollstonecraft, male writers such as Rousseau imply that women are incapable of acquiring true moral virtue since women are intellectually inferior to men. Wollstonecraft concedes that women commonly portray intellectual inferiority since they are educated from childhood to be timid slaves, which supposedly make them more alluring for men. The solution, for Wollstonecraft, is to educate women to develop their rational abilities. Since the development of moral virtue is a function of reason, then, as rational beings, women can fully participate in moral virtue.

Wollstonecraft held that morality is the same for both men and women, given the fact that morality is a function of reason. However, many contemporary feminist philosophers advocate a uniquely female conception of morality. In "Ethics from the Stand Point of Women" (1990), Nel Noddings argues that an ethic of care is a quest for new virtues based on traditional women's practices, even when these practices are abandoned. Noddings recognizes that, traditional philosophers believed that women were morally inferior to men, and that female goodness fundamentally involved obedience, industry, silence, and service. She argues, though, that these traditional female roles as nurturers can be shaped into an ethic of care. The central features of care include the Christian notion of agape love, and emphasizes needs over rights, and love over duty. For Noddings, gender-free morality may be impossible. Men invent the criteria of what constitutes an adequate moral theory and, so female discourse on the subject may be handicapped. The entire discussion of care itself would not have arisen if women did not initiate it. Although men might criticize that genderized ethics cannot attain universality, Noddings responds that feminists cannot be accused of genderizing ethics since ethics already is genderized. In fleshing out the essence of care, Noddings proposes that we look at traditional caring roles of women, cooking, teaching, nursing, and childhood education. Even though many of these tasks are exploitive, they require virtues or character traits that are commonly overlooked. Most searches for virtues follow Aristotle's model, which derives from the elite class, as opposed to slaves and women. However, according to Noddings we must look to everyday experience to find practices that may be deemed virtuous.

James Frederick Ferrier (1808-1864)

Life and Writings. James Frederick Ferrier was born in Edinburgh on June 16, 1808, the son of John Ferrier, writer to the signet. Ferrier was educated by the Reverend H. Duncan, at the manse of Ruthwell, Dumfriesshire; and afterwards at Edinburgh High School, and under Dr. Charles Parr Burney, son of Dr. Charles Burney (1757-1817), at Greenwich. He was at the university of Edinburgh from 1825-1827, and then became a fellow-commoner of Magdalen College, Oxford, where he graduated BA. in 1831. He formed in the same year the acquaintance of Sir William Hamilton, whose influence upon him was very great, and for whose personal character and services to speculation he expresses the highest reverence. For years together he was almost daily in Hamilton's company for hours. In 1832 he became an advocate, but apparently never practiced. His metaphysical tastes, stimulated by Hamilton's influence, led him to spend some months at Heidelberg in 1834, in order to study German philosophy. He was on intimate terms with his aunt, Miss Ferrier, and his uncle, John Wilson, and in 1837 married his cousin, Margaret Anne, eldest daughter of John Wilson. He became a contributor to *Blackwood's Magazine*." He there wrote an article on Coleridge's plagiarisms in 1840. His first metaphysical publication was a series of papers, reprinted in his *Remains*, called "An Introduction to the Philosophy of Consciousness," in *Blackwood's Magazine* for 1838 and 1839.

In 1842 he was appointed professor of civil history in the university of Edinburgh; and in 1844-5 he lectured as William Hamilton's substitute. In 1845 he was elected professor of moral philosophy and political economy at St. Andrews. He was a candidate for the professorship of moral philosophy, resigned by Wilson in 1852, and for the professorship of logic and metaphysics vacated by Hamilton's death in 1856. But he was unsuccessful on both occasions, and continued at St. Andrews until his death. His chief work, the *Institutes of Metaphysic*, was published in 1854. The theory which it upholds had been already expounded to his class. It reached a second edition in 1856. In the same year he replied to his critics in a vigorous pamphlet called *Scottish Philosophy, the Old and New*, which, with certain omissions, is published as an "Appendix to the Institutes" in his *Remains*. He thought that the misunderstandings of his previous exposition had told against his candidature for the chair of metaphysics. Ferrier devoted himself to his professorial duties at St. Andrews; wrote and carefully rewrote his lectures, and lived chiefly in his study. He could seldom be persuaded to leave St. Andrews even for a brief excursion. An attack of angina pectoris in November 1861 weakened him permanently, though he continued to labor, and gave lectures in his own house. Renewed attacks followed in 1863, and he died at St. Andrews on June 11, 1864. After his death his minor publications were collected and published together along with a series of lectures as *Lectures on Greek Philosophy and other philosophical remains* (1866).

Philosophy. **Ferrier provides the earliest, and in some ways the most impressive, statement of absolute idealism in English philosophy. As an historian of philosophy Ferrier did not pretend to exceptional research; but he had an ability to give a living presentation of their views. The history of philosophy was, for him, no mere record of discarded systems but "philosophy itself taking its time." He was a sympathetic student of the German philosophers, banned by his friend Hamilton. It is difficult to trace any direct influence of Hegel upon his own doctrine, and indeed he said that he could not understand Hegel. But both his earlier and his later writings have an affinity with Fichte -- especially in their central doctrine: the stress laid on self-consciousness, and its distinction from the "mental states" with which the psychologist is concerned. This doctrine connects him with Berkeley also. He was one of the first to appreciate the true nature of Berkeley's thought, as not a mere transition-stage between Locke and Hume, but as a discovery of the spiritual nature of reality.**

In an essay on "Berkeley and Idealism," published in 1842, perhaps Ferrier's most perfect piece of philosophical writing, he signalizes both the essential truth and the essential defect in a theory which was at the time much less understood than it is now. Berkeley, he says, "certainly was the first to stamp the indelible impress of his powerful understanding on those principles of our nature, which, since his time, have brightened into imperishable truths in the light of genuine speculation. His genius was the first to swell the current of that mighty stream of tendency towards which all modern meditation flows, the great gulf-stream of Absolute Idealism." The element o peculiar value in Berkeley's speculation is its concreteness, its faithfulness to reality.

> **The peculiar endowment by which Berkeley was distinguished, far beyond almost every philosopher who has succeeded him, was the eye he had *for facts*, and the singular pertinacity with which he refused to be dislodged from his hold upon them. . . . No man ever delighted less to expatiate in the regions of the occult, the abstract, the impalpable, the fanciful, and the unknown. His heart and soul clung with inseparable tenacity to the concrete realties of the universe; and with an eye uninfluenced by spurious theories, and unperverted by false knowledge, he saw directly into the very life of things.**

His theory needs only to be widened, and thus corrected, to provide the true explanation of which philosophy is in search. How this is to be done, is more clearly stated in the *Institutes*.

> **He saw that something subjective was a necessary and inseparable part of every object of cognition. But instead of maintaining that it was the ego or oneself which clove inseparably to all that could be known, and that this element must be thought of along with all that is thought of, he rather held that it was the senses, or our perceptive modes of cognition, which clove inseparably to all that could be known, and that these required to be thought of along with all that could be thought of. These, just as much as the ego, were held by him to be the subjective part of the total synthesis of cognition which could not by any possibility be discounted. Hence the unsatisfactory character of his ontology, which, when tried by the test of a rigorous logic, will be found to invest the Deity -- the supreme mind, the infinite ego, which the terms of his system necessarily compel him to place in synthesis with all things -- with human modes of apprehension, with such senses as belong to man -- and to invest Him with these, not as a matter of contingency, but as a matter these, not as a matter of necessity. Our only safety lies in the consideration -- a consideration which is a sound, indeed inevitable**

> **logical inference -- that our sensitive modes of apprehension are mere contingent elements and conditions of cognition; and that the ego or subject alone enters, of necessity, into the composition of everything which any intelligence can know.**

Although there are occasional references to Kant in Ferrier's works, he develops his theory through a continuous criticism of Reid, on the one hand, and of Hamilton, on the other. Reid is, for him, the representative of Psychology or the "science of the human mind," and therefore, despite his own protestations to the contrary, of "Representationism." Hamilton is the representative of Agnosticism, or the doctrine of the unknowableness of the Absolute Reality. Against the former view, he argues that we have a direct knowledge of Reality, both material and spiritual; against the latter, he formulates his "agnoiology" or "theory of ignorance," to prove that the "ignorance" of which Hamilton would convict the human mind is not properly called ignorance or defect, but is simply that repudiation of the unintelligible or self-contradictory which is the essential characteristic of intelligence, rather than a defect peculiar to the human mind.

The fundamental error of Psychology is the acceptance of sensation, or the "state of consciousness," as the original datum of knowledge, the consequence being that the inference to the existence of the object, as well as to the subject, is more or less uncertain. As a matter of fact, the subject and the object are inseparable. "Matter *per se*" is never the object of knowledge; what we perceive is always "Matter *mecum*." The elementary fact of knowledge is not matter, but the perception of matter, or the subject as conscious of the object, either subjective or objective. Mere "phenomena" never exist; what exists is always phenomenal to a self or subject. If we define "substance" as that which is capable of existing, or of being conceived, alone and independently, then the conscious self, that is, the subject as conscious of an object, is substance, and can be known. The ego cannot know objects without knowing itself along with them; it cannot know itself except along with objects. It is because the psychologists have ignored the conscious, or rather the self-conscious self, which is present in all knowledge, that they have been unable to escape the conclusion that all we know is "ideas" or "phenomena" which represent, and may misrepresent, the object or substantial reality.

For the refutation of the Hamiltonian doctrine of the Relativity of Knowledge, Ferrier formulated what he regarded as an entirely original "theory of ignorance." Ignorance, he holds, presupposes the possibility of knowledge; we can be ignorant only of that which it is possible for us to know. It is not a defect, but a merit of knowledge not to know that which cannot be known because it is the unintelligible or the self-contradictory. Now we have seen that subject and object, or mind and matter, *per se*, are both alike unknowable in this sense; since they are never presented in consciousness alone but always together, it follows that they cannot be represented or thought in separation from one another. It is of such an inconceivable or unintelligible reality that Hamilton proclaims that ignorance is inevitable; he might as well proclaim the unknowableness of Nothing, or of Nonsense. It is the glory, rather than the humiliation, of intelligence to repudiate the unintelligible or self-contradictory.

On the basis of this "epistemology" and "agnoiology" Ferrier proceeds to construct his "ontology." Self-conscious mind, the ultimate element in knowledge, is also the ultimate element in existence. Repudiating the errors of subjective idealism, he finds himself compelled to accept absolute or objective idealism. The individual ego, along with the universe of his thought, is not independent. "The only *independent* universe which any mind or ego can think of is the universe in synthesis with some *other* mind or ego." And since *one* such other mind is sufficient to account for the universe of our experience, we are warranted in inferring that there is only one. Ferrier thus

summarizes the argument which yields "this theistic conclusion":

> **Speculation shows us that the universe, by itself, is the contradictory; that it is incapable of self-subsistency, that it can exist only *cum alio*, that all true and cogitable and non-contradictory existence is a synthesis of the subjective and the objective; and *then* we are compelled, by the most stringent necessity of thinking, to conceive a supreme intelligence as the ground and essence of the Universal Whole. Thus the postulation of the Deity is not only permissible, it is unavoidable. Every mind thinks, and *must* think of God (however little conscious it may be of the operation which it is performing), whenever it thinks of anything as lying beyond all human observation, or as subsisting in the absence or annihilation of all finite intelligences.**

The ethical implications of such an idealism are strikingly suggested in the *Philosophy of Consciousness*, where the parallelism between the functions of self-consciousness in the intellectual and in the moral spheres is made clear, and it is shown that "just as all perception originates in the antagonism between consciousness and our sensations, so all morality originates in the antagonism between consciousness and the passions, desires, or inclinations of the natural man." It is in this refusal to accept the guidance of the natural passions and inclinations, this "direct antithesis" of the "I" to the "natural man," that our moral freedom consists. What is this supreme act by which man asserts his supremacy over nature, within and without himself?

> **What is it but the act of consciousness, the act of becoming "I," the act of placing *ourselves* in the room which sensation and passion have been made to vacate? This act may be obscure in the extreme, but still it is an act of the most *practical* kind, both in itself and in its results. . . . For what act can be more vitally practical than the act by which we realize our existence as free personal beings? and what act can be attended by a more practical result than the act by which we look our passions in the face, and, in the very act of looking at them, *look them down*?**

The Internet Encyclopedia of Philosophy

Immanuel Hermann Fichte (1797-1879)

German philosopher, son of Johann Gottlieb Fichte b. at Jena July 18, 1797- d. at Stuttgart Aug. 8, 1879. He was for many years a gymnasial professor at Saarbrucken and Dusseldorf, and then professor of philosophy at Bonn 1836-42 (ordinary professor after 1840), and at Tubingen 1842-63. In 1863 he retired from the university and soon afterward settled in Stuttgart. He edited his father's works, founded and edited the *Zeitschrift fur Philosophie und spekulative Theologie*, and was a prolfic writer on philosophy. In metaphysics his position was that of a mediator between the two conflicting views represented by Hegel and Herbart, and, too, in the interest of theology. His great aim was to secure a philosophical basis for the personality of God. Taking the monadology of Leibniz as the model of a system embracing unity in plurality and plurality in unity, he sought to fuse extreme spiritualistic monism and extreme pluralistic realism into what he called concrete theism. The more important of his independent works are, *Beitrdge zur Charakteristik der rteuern Philosophie* (Sulzbach, 1829; 2d ed., completely rewritten, 1841); *Religion und Philosophie* (Heidelberg, 1834*); Die speculative Theologie* (3 parts, 1846); *System der Ethik* (2 vols., Leipsic, 1850-53); *Anthropologie* (18-56); *Vermischte Schriften* (2 vols., 1869); *Die theistische Weltansicht und ihre Berechtigung* (1873); and *Der neuere Spiritualismus* (1878).

Johann Gottlieb Fichte (1762-1814)

Johann Gottlieb Fichte is one of the major figures in German philosophy in the period between Kant and Hegel. Initially considered one of Kant's most talented followers, Fichte developed his own system of transcendental idealism, the *Wissenschaftslehre*, which sought to work out in great detail Kant's insight that finite rational beings such as ourselves are to be interpreted in terms of both theoretical and practical reason. Through technical philosophical works and popular writings Fichte exercised great influence over his contemporaries, especially during his years at the University of Jena. His influence waned towards the end of his life, and Hegel's subsequent dominance in German philosophy relegated Fichte to the status of a transitional figure whose thought helped to explain the development of German idealism from Kant's Critical philosophy to Hegel's philosophy of Spirit. Today, however, Fichte is rightly seen as an important philosopher in his own right, as a thinker who carried on the Kantian legacy of transcendental philosophy in a highly original form.

Section Headings:

Fichte's Beginnings (1762-1794)

(a) Early life

Fichte was born on May 19, 1762 to a family of ribbon makers. Early in life he impressed everyone with his great intelligence, but his parents were too poor to pay for his schooling. Through the patronage of a local nobleman, he was able to attend the Pforta school, which prepared students for a university education, and then the universities of Jena and Leipzig. Unfortunately, little is known about this period of Fichte's life, but we do know that he intended to obtain a degree in theology, and that he had to break off his studies for financial reasons around 1784, without obtaining a degree of any sort. Several years of earning his living as an itinerant tutor ensued, during which time he met his future wife, Johanna Rahn, while living in Zurich.

In the summer of 1790, while living in Leipzig and once again in financial distress, Fichte agreed to tutor a university student in the Kantian philosophy, about which he knew very little at the time. His immersion in Kant's writings, according to his own testimony, revolutionized his thinking and changed his life, turning him away from a deterministic view of the world at odds with human freedom towards the doctrines of the Critical philosophy and its reconciliation of freedom and determinism.

[Return to Section Headings]

(b) Fichte's sudden rise to prominence

More wandering and frustration followed. Fichte decided to travel to Königsberg to meet Kant himself, and on July 4, 1791 the disciple had his first interview with the master. Unfortunately for Fichte, things did not go well, and Kant was not especially impressed by his visitor. In order to prove his expertise in the Critical philosophy, Fichte quickly composed a manuscript on the relation of the Critical philosophy to the question of divine revelation, an issue that Kant had yet to consider. This time, Kant was justifiably impressed by the results and arranged for his own publisher to bring out the work, which appeared in 1792 under the title *An Attempt at a Critique of all Revelation*.

In this fledgling effort Fichte adhered to many of Kant's claims about religion by extending them to concept of revelation. In particular, he took over Kant's idea that all religious belief must ultimately withstand critical scrutiny if it is to make a legitimate claim on us. For Fichte, any alleged revelation of

God's activity in the world must pass a moral test: namely, no immoral command or action, i.e., nothing that violates the moral law, can be attributed to Him. Although Fichte himself did not explicitly criticize Christianity by appealing to this test, such a restriction on the content of a possible revelation, if consistently imposed, would overturn most aspects of orthodox Christian belief: including, for example, the doctrine of original sin, which states that everyone is born guilty as a result of Adam and Eve's disobedience in the Garden of Eden. This piece of Christian theology, which is said to be grounded in the revelations contained in the Bible, is hardly compatible with the ordinary view of justice that Kant and Fichte took to be underwritten by the moral law, and that maintains that we are not guilty for crimes or transgressions that we did not commit. Attentive readers should have instantly gleaned Fichte's radical views from the placid Kantian prose.

For reasons that are still mysterious, Fichte's name and preface were omitted from the first edition of *An Attempt at a Critique of all Revelation*, and thus the book, which displayed an extensive and subtle appreciation of Kant's thought, was taken to be the work of Kant himself. Once it became known that Fichte was the author, he instantly became a philosophical figure of importance; no one whose work had been mistaken for Kant's, however briefly, could be rightfully denied fame and celebrity in the German philosophical world.

Fichte continued working as a tutor while attempting to reformulate his philosophical insights of recent years into his own system. He also anonymously published two political works, "Reclamation of the Freedom of Thought from the Princes of Europe, Who Have Oppressed It Until Now" and *Contribution to the Rectification of the Public's Judgment of the French Revolution*. It became widely known that he was their author; and so from the very beginning of his public career, he was identified with radical causes and views. In October 1793 he married his fiancee, and shortly thereafter unexpectedly received a call from the University of Jena to take over the chair in philosophy that Karl Leonhard Reinhold (1758-1823), a well-known exponent and interpreter of the Kantian philosophy, had recently vacated. Fichte arrived in Jena in May 1794.

[Return to Section Headings]

The Jena Period (1794-1799)

(a) Fichte's philosophical vocation

In his years at Jena, which lasted until 1799, Fichte published the works that established his lasting reputation as one of the major figures in the German philosophical tradition. Fichte never exclusively saw himself as an academic philosopher addressing the typical audience of fellow philosophers, university colleagues, and students. Instead, he considered himself a scholar with a wider role to play beyond the confines of academia, a view eloquently expressed in "Some Lectures Concerning the Scholar's Vocation," which were delivered to an overflowing lecture hall shortly after his much anticipated arrival in Jena. One of the tasks of philosophy, according to these lectures, is to offer rational guidance towards the ends that are most appropriate for a free and harmonious society. The particular role of the scholar – that is, of individuals such as Fichte himself, regardless of their particular academic discipline – is to be a teacher of mankind and a superintendent of its never-ending progress towards perfection.

Throughout his career Fichte alternated between composing philosophical works for scholars and students of philosophy and popular works for the general public. This desire to communicate to the wider

public – to bridge the gap, so to speak, between theory and praxis – inspired his writings from the start. In fact, Fichte's passion for the education of society as a whole should be seen as a necessary consequence of his philosophical system, which continues the Kantian tradition of placing philosophy in the service of enlightenment, the eventual liberation of mankind from its self-imposed immaturity, i.e., its willing refusal to think for itself, and thus its responsibility for failing to act independently of the guidance of external authority.

[Return to Section Headings]

(b) Fichte's system, the *Wissenschaftslehre*

Fichte called his philosophical system the *Wissenschaftslehre*. The usual English translations of this term as "science of knowledge," "doctrine of science," or "theory of science" can be misleading, since today these phrases carry connotations that can be excessively theoretical or too reminiscent of the natural sciences. Therefore, many English-language commentators and translators prefer to use the German term as the untranslated proper name that designates Fichte' s system as a whole. Another source of confusion is that Fichte's book from 1794/5, *Foundations of the Entire Wissenschaftslehre*, is sometimes simply referred to as the *Wissenschaftslehre*. Strictly speaking, this is incorrect, since this work, as its title indicates, was meant as the foundations of the system as a whole; the other parts of the system were to be written later. Much of Fichte's work in the remainder of the Jena period attempted to complete the system as it was envisioned in the *Foundations* of 1794/5.

[Return to Section Headings]

(c) Background to the *Wissenschaftslehre*

Before moving to Jena, and while he was living in the house of his father-in-law in Zurich, Fichte wrote two short works that presaged much of the *Wissenschaftslehre* that he devoted the rest of his life to developing. The first of these was a review of a skeptical critique of Kantian philosophy in general and Reinhold's so-called *Elementarphilosophie* ("The Philosophy of Elements") in particular. The work under review, an anonymously published polemic called *Aenesidemus*, which was later discovered to have been written by Gottlob Ernst Schulze (1761-1833), and which appeared in 1792, greatly influenced Fichte, causing him to revise many of his views, but without leading him to abandon Reinhold's concept of philosophy as rigorous science, an interpretation of the nature of philosophy that demanded that philosophical principles be systematically deduced from a single, foundational principle known with apodictic certainty.

Reinhold had argued that this first principle was what he called the "principle of consciousness," namely, the proposition that "in consciousness representation is distinguished through the subject from both object and subject and is related to both." From this principle Reinhold attempted to deduce the contents of Kant's Critical philosophy. He claimed that the principle of consciousness was a reflectively known fact of consciousness, and argued that it could lend credence to various Kantian views, including the distinction between the faculties of sensibility and understanding and the existence of things in themselves. Schulze countered along Humean lines by offering skeptical objections against the legitimacy of Kant's (and thus Reinhold's) concept of the thing in itself (construed as the causal origin of our representations) and by arguing that the principle of consciousness was neither a fundamental principle (since it was subject to the laws of logic, in that it had to be free of contradiction) nor one known with apodictic certainty (since it originated in merely empirical reflection on the contents of

consciousness, which reflection Schulze, following David Hume, persuasively argued could not yield a principle grounded on indubitable evidence).

Fichte, to his consternation, found himself in agreement with much of Schulze's critique. Although he was still eager to support the Kantian system, Fichte, as a result of reading Schulze, came to the conclusion that the Critical philosophy needed new foundations. Yet the search for new foundations, in Fichte's mind, was never equivalent to a repudiation of the Kantian philosophy: as Fichte would frequently claim, he remained true to the spirit, if not the letter, of Kant's thought. His review of Schulze's *Aenesidemus* provides one tantalizing hint about how he would subsequently attempt to remain within the spirit of Kant's thought while attempting to reconstruct it from the ground up: philosophy, he says, must begin with a first principle, as Reinhold maintained, but not with one that expresses a mere fact, a *Tatsache*; instead, it must begin with a fact/act, a *Tathandlung*, that is not known empirically, but rather with self-evident certainty. The meaning and purpose of this new first principle would not become clear to his readers until the publication of the *Foundations of the Entire Wissenschaftslehre* in 1794/5.

In addition to his review of the Schulze book, and still prior to his arrival in Jena, Fichte sketched out the nature and methodology of the *Wissenschaftslehre* in an essay entitled "Concerning the Concept of the *Wissenschaftslehre*," which was intended to prepare his expectant audience for his classes and lectures. Here Fichte sets out his conception of philosophy as the science of science, i.e., as *Wissenschaftslehre*. The *Wissenschaftslehre* is devoted to establishing the foundation of individual sciences such as geometry, whose first principle is said to be the task of limiting space in accordance with a rule. Thus the *Wissenschaftslehre* seeks to justify the cognitive task of the science of geometry, i.e., its systematic efforts at spatial construction in the form of theorems validly deduced from axioms known with self-evident certainty. The *Wissenschaftslehre*, which itself is a science in need of a first principle, is said to be grounded on the *Tathandlung* first mentioned in the *Aenesidemus* review. The precise nature of this fact/act, from which the *Wissenschaftslehre* is supposed to begin, is much debated, even today. Yet it is the essential core of the Jena *Wissenschaftslehre* in general, and of the *Foundations of the Entire Wissenschaftslehre* from 1794/5 in particular.

[Return to Section Headings]

(d) *Foundations of the Entire Wissenschaftslehre* 1794/5

In the *Foundations* Fichte expresses the content of the *Tathandlung* in its most general form as "the I simply posits itself." Fichte is suggesting that the self, which he typically refers to as "the I," is not merely a static thing with fixed properties, but rather a self-producing process; yet if it is a self-producing process, then it must be free, since in some as yet unspecified fashion it owes its existence to nothing but itself. This admittedly obscure starting point is subject to much scrutiny and qualification as the *Wissenschaftslehre* proceeds. In more modern language, and as a first approximation of its meaning, we can understand the *Tathandlung* as expressing the concept of a rational agent that constantly interprets itself in light of standards that it imposes on itself, in both the theoretical and practical realms, in its efforts to determine what it ought to believe and how it ought to act. (Fichte's indebtedness to the Kantian notion of autonomy in the form of self-imposed lawfulness should be obvious to anyone familiar with the Critical philosophy.)

Given the difficulty of the notion, unfortunately, Fichte's *Tathandlung* has perplexed his readers from its first appearance. The principle of the self-positing I was initially interpreted along the lines of Berkeley's idealism, and thus as claiming that the world as a whole was somehow the product of an infinite mind.

This interpretation is surely mistaken, even if one can occasionally find passages that seem to support it. More important, though, is the question of the epistemic status of the principle. Is it known with the self-evident certainty that Fichte, following Reinhold, claims must ground any attempt at systematic knowledge? And how does it serve as a basis for deducing the rest of the *Wissenschaftslehre*?

Fichte's method is usually said to be phenomenological, restricting itself to what we can discover by means of reflection. Yet Fichte does not claim that we simply *find* the fully formed *Tathandlung* residing somewhere in our self-consciousness; instead, we *construct* it in order to explain ourselves to ourselves, to render intelligible to ourselves our normative nature as finite rational agents. Thus the requisite reflection is not empirical but transcendental, i.e., a postulate adopted for philosophical purposes. That is, the principle is presupposed as true in order to account for the conditions for the possibility of our ordinary experience. Such a procedure leaves open the possibility of an alternative account of our experience, which Fichte claims can take only one form. Either, he says, we can begin (as he does) with the I as the ground of all possible experience, or we can begin with the thing in itself outside of our experience. This dilemma, as he puts it, is the choice between idealism and dogmatism. The former is transcendental philosophy; the latter, a naturalistic approach to experience that explains it solely in causal terms. The choice between the two, as Fichte famously said in the first introduction to the *Wissenschaftslehre* from 1797, depends on the kind of person one is, since they are mutually exclusive yet equally possible approaches.

If such a choice between starting points is possible, however, then the principle of the self-positing I lacks the self-evident certainty that Fichte attributed to it in his earlier essay on the concept of the *Wissenschaftslehre*. There are, in fact, those who do not find it at all self-evident, namely, the dogmatists. Fichte clearly thinks that they are mistaken in their dogmatism, yet he offers no direct refutation of their position, claiming only that they cannot demonstrate what they hope to demonstrate, namely, that the ground of all experience lies solely in objects existing independently of the I. The dogmatist position, Fichte implies, ignores the normative aspects of our experience, e.g., warranted and unwarranted belief, correct and incorrect action, and thus attempts to account for our experience entirely in terms of our causal interaction with the world around us. Presumably, however, someone who begins with a disavowal of normativity, as the dogmatists do (since that is the kind of person they are), can never be brought to agree with the idealists. There is thus an argumentative impasse between the two camps.

Fichte's remarks about systematic form and certainty in "Concerning the Concept of the *Wissenschaftslehre*" give the impression that he intends to demonstrate the entirety of the *Wissenschaftslehre* from the principle of the self-positing I through a chain of logical inferences that merely set out the implications of the initial principle in such a way that the certainty of the first principle is transferred to the claims inferred from it. (The method of Spinoza's *Ethics* comes to mind, but this time with only a single premise from which to begin the proofs.) Yet this hardly seems to be Fichte's true method, since he constantly introduces new concepts that cannot be plausibly interpreted as the logical consequences of the previous ones. In other words, the deductions in the *Foundations of the Entire Wissenschaftslehre* are more than merely analytical explications of the consequences of the original premise. Instead, they both articulate and refine the initial principle of the self-positing I in accordance with the demands made on the idealist who is attempting to clarify the nature of the self-positing I by means of reflection.

Once Fichte postulates the self-positing I as the explanatory ground of all experience, he begins to complicate the web of concepts required to make sense of this initial postulate, thereby carrying out the

aforementioned construction of the self-positing I. The I posits itself insofar as it is aware of itself, not only as an object but also as a subject, and finds itself subject to normative constraints in both the theoretical and practical realms, e.g., that it must be free of contradiction and that there must be adequate reasons for what it believes and does. Furthermore, the I posits itself as free, since these constraints are ones that it imposes on itself. Next, by means of further reflection, the I discovers a difference between "representations accompanied by a feeling of necessity" and "representations accompanied by a feeling a freedom" – that is, a difference between representations of what purports to be a objective world existing apart from our representations of it and representations that are merely the product of our own mental activity. To recognize this distinction in our representations, however, is to posit a distinction between the I and the not-I, i.e., the self and whatever exists independently of it. In other words, the I posits itself as limited by something other than itself, even though it also initially posits itself as free.

The nature of this limitation is made increasingly more complex through further acts of reflection. First, the I posits a check, an *Anstoß*, on its practical activity, in that it encounters resistance to its will when it acts in the world. This check is then developed into more refined forms of limitation: sensations, intuitions, and concepts, all united in the experience of the things of the natural world, i.e., the spatio-temporal realm ruled by causal laws. Moreover, this world is found to contain other finite rational beings. They too are free yet limited, and the recognition of their freedom places further constraints on our activity. In this way the I posits the moral law and restricts its treatment of others to actions that are consistent with respect for their freedom. Thus, by the end of Fichte's deductions, the I posits itself as free yet limited by natural necessity and the moral law: its freedom becomes an infinite task in which it seeks to make the world around itself entirely compliant with its will, but only by doing so in an appropriately moral fashion that allows other free beings to do the same for themselves.

[Return to Section Headings]

(e) Working out the *Wissenschaftslehre* and the end of the Jena period

Fichte's writings during the rest of the Jena period sought to fill out and refine the entire system. The *Foundations of Natural Right Based on the Wissenschaftslehre* (1796/7) and *The System of Ethical Theory Based on the Wissenschaftslehre* (1798) concern themselves with political philosophy and moral philosophy, respectively. The task of the former work is to characterize the legitimate constraints that can be placed on individual freedom in order to produce a community of maximally free individuals who simultaneously respect the freedom of others. The task of the latter work is to characterize the specific duties of rational agents who freely produce objects and actions in the pursuit of their goals. These duties follow from our general obligation to determine ourselves freely, i.e., from the categorical imperative.

Besides filling out projected portions of the system, Fichte also began to revise the foundations themselves. Since he considered the mode of presentation of the *Foundations of the Entire Wissenschaftslehre* unsatisfactory, he began drawing up a new version in his lectures, which were given three times between 1796 and 1799, but which he never managed to publish during his lifetime. These lectures, which in many respects are superior to the *Foundations of the Entire Wissenschaftslehre*, were published posthumously and are now known as the *Wissenschaftslehre nova methodo*.

Prior to publishing any systematic presentation of his philosophy of religion, Fichte became embroiled in what is now known as the *Atheismusstreit*, the atheism controversy. In an essay from 1798 entitled "On the Basis of Our Belief in a Divine Governance of the World" Fichte argued that religious belief could be legitimate only insofar as it arose from properly moral considerations – a view clearly indebted to his

book on revelation from 1792. Furthermore, he claimed that God has no existence apart from the moral world order. (This second view was also an old one, initially suggested in the *Aenesidemus* review.) Neither view was orthodox at the time, and so Fichte was accused of atheism and ultimately forced to leave Jena.

Two open letters, both from 1799 and written by philosophers whom Fichte fervently admired, compounded his troubles. First, Kant disavowed the *Wissenschaftslehre* for mistakenly having tried to infer substantive philosophical knowledge from logic alone. Such an inference, he claimed, was impossible, since logic abstracted from the content of knowledge and thus could not produce a new object of knowledge. Second, Friedrich Heinrich Jacobi accused the *Wissenschaftslehre* of nihilism: that is, of producing reality out of mere mental representations, and thus in effect from nothingness. Whether or not these criticisms were just (and Fichte certainly denied that they were), they further damaged Fichte's philosophical reputation.

[Return to Section Headings]

The Berlin Period (1800-1814)

(a) The eclipse of Fichte's career

In 1800 Fichte settled in Berlin and continued his work through private lectures and publishing new works, since on his arrival there was no university in the city. The Berlin years, while productive, represent a decline in Fichte's fortunes, since he never regained the degree of influence among philosophers that he had enjoyed during the Jena years, although he remained a popular author among non-philosophers. His first publication was a popular presentation of the *Wissenschaftslehre* designed to answer his critics on the question of atheism. Known as *The Vocation of Man*, it appeared in 1800 and is probably Fichte's greatest literary production. (It seems, though this is never explicitly stated anywhere in the book, that much of it was inspired by the personally stinging critique of Jacobi's open letter.)

Fichte continued to revise the *Wissenschaftslehre*, yet he published very little from these renewed efforts to perfect his system, primarily for fear of being misunderstood as he had been during the Jena years. His reluctance to publish gave his contemporaries the false impression that Fichte was more or less finished as an original philosopher. Except for a cryptic outline that appeared in 1810, his Berlin lectures on the *Wissenschaftslehre*, of which there are numerous versions, only appeared posthumously. In these manuscripts Fichte typically speaks of the absolute and its appearances, i.e., a philosophically suitable stand-in for a more traditional notion of God and the community of finite rational beings whose existence is grounded in the absolute. As a result, Fichte is sometimes said to have taken a religious turn in the Berlin period.

[Return to Section Headings]

(b) Popular writings from the Berlin period

In 1806 Fichte published two lecture series that were well-received by his contemporary audience. The first, *The Characteristics of the Present Age*, employs the *Wissenschaftslehre* for the purposes of the philosophy of history. According to Fichte, there are five stages of history in which the human race progresses from the rule of instinct to the rule of reason. The present age, he says, is the third age, an epoch of liberation from instinct and external authority, out of which humanity will ultimately progress until it makes itself and the world it inhabits into a fully self-conscious representative of the life of

reason. The second, *The Way Towards the Blessed Life*, which is sometimes said to be a mystical work, treats of morality and religion in a popular format.

Another famous series of lectures, *Addresses to the German Nation*, given in 1808 during the French occupation, was intended as a continuation of *The Characteristics of the Present Age*, but exclusively for a German audience. Here Fichte envisions a new form of national education that would enable the German nation, not yet in existence, to reach the fifth and final age outlined in the earlier lecture series. Once again, Fichte demonstrated his interest in larger matters, and in a manner perfectly consistent with his earlier insistence from the Jena period that the scholar has a cultural role to play.

[Return to Section Headings]

(c) Fichte's return to the university and his final years

When the newly founded Prussian university in Berlin opened in 1810, Fichte was made the head of the philosophy faculty; and in 1811 he was elected the first rector of the university. He continued his philosophical work until the very end of his life, lecturing on the *Wissenschaftslehre* and writing on political philosophy and other subjects. When the War of Liberation broke out in 1813, Fichte canceled his lectures and joined the militia. His wife Johanna, who was serving as a volunteer nurse in a military hospital, contracted a life-threatening fever. She recovered, but Fichte succumbed to the same infection. He died of his illness on January 29, 1814.

[Return to Section Headings]

Conclusion

Although Fichte's importance for the history of German philosophy is undisputed, the nature of his legacy is still very much debated. He has sometimes been seen as a mere transitional figure between Kant and Hegel, as little more than a philosophical stepping stone along Spirit's path to absolute knowledge. This understanding of Fichte was encouraged by Hegel himself, and no doubt for self-serving reasons. Nowadays, however, Fichte is studied more and more for his own sake, in particular for his theory of subjectivity, i.e., the theory of the self-positing I, which is rightly seen as a sophisticated elaboration of Kant's claim that finite rational agents must interpret themselves in both theoretical and practical terms. The level of detail that Fichte provides on these matters far exceeds that found in Kant's writings. This fact alone would make Fichte's work worthy of our attention. Yet perhaps the most persuasive testament to Fichte's greatness as a philosopher is to be found in his relentless willingness to begin again, to start the *Wissenschaftslehre* anew, and never to rest content with any prior formulation of his thought. Although this leaves his readers perpetually dissatisfied and desirous of a definitive statement of his views, Fichte, true to his publically declared vocation, makes them into better philosophers through his own example of restless striving for the truth.

Bibliography and Suggested Readings

Fichte's Writings in German

Gesamtausgabe der Bayerischen Akademie der Wissenschaften, ed. R. Lauth, H. Jacobs, and H.

Gliwitzky, Stuttgart-Bad Cannstatt: Frommann, 1964-.

Fichtes Werke, ed. Immanuel Hermann Fichte, 11 vols., Berlin: Walter de Gruyter & Co., 1971. (Reprint of the 19th century edition of Fichte's work edited by his son.)

Fichte's Writings in English Translation

(Publication dates during Fichte's lifetime are given in brackets.)

Fichte: Early Philosophical Writings [1790-1799], trans. and ed. Daniel Breazeale, Ithaca: Cornell University Press, 1988. (Includes "Review of *Aenesidemus*," "Concerning the Concept of the *Wissenschaftslehre*," and "Some Lectures Concerning the Scholar's Vocation.")

Attempt at a Critique of all Revelation [1792[1], 1793[2]], trans. Garrett Green, Cambridge: Cambridge University Press, 1978.

"Reclamation of the Freedom of Thought from the Princes of Europe, Who Have Oppressed It Until Now" [1793], trans. Thomas E. Wartenberg, in James Schmidt (ed.) *What is Enlightenment? Eighteenth-Century Answers and Twentieth-Century Questions*, Berkeley: University of California Press, 1996.

"On the Spirit and the Letter in Philosophy" [1794], trans. Elizabeth Rubenstein, in David Simpson (ed.) *German Aesthetic and Literary Criticism: Kant, Fichte, Schelling, Schopenhauer, Hegel*, Cambridge: Cambridge University Press, 1984.

The Science of Knowledge [1794/5], trans. Peter Heath and John Lachs, Cambridge: Cambridge University Press, 1982. (German title would be better translated as *Foundations of the Entire Wissenschaftslehre*. Also includes the two introductions to the *Wissenschaftslehre* from 1797.)

"On the Linguistic Capacity and the Origin of Language" [1795], in Jere Paul Surber (trans. & ed.) *Language and German Idealism: Fichte's Linguistic Philosophy*, Atlantic Highlands, NJ: Humanities Press, 1996.

Foundations of Transcendental Philosophy (Wissenschaftslehre) nova methodo (1796/99), trans. and ed. Daniel Breazeale, Ithaca: Cornell University Press, 1992. (Posthumously published lectures given between 1796 and 1799.)

The Science of Rights [1796/7], trans. A E. Kroeger, London: Trübner & Co., 1889. (Reprint — London: Routledge & Kegan Paul, 1970.) (German title would be better translated as *Foundations of Natural Right Based on the Wissenschaftslehre*. An unreliable translation.)

Introductions to the Wissenschaftslehre and Other Writings [1797-1800], trans. and ed. Daniel Breazeale, Indianapolis: Hackett Pub. Co., 1994. (Includes the two introductions to the *Wissenschaftslehre* from 1797 and "On the Basis of Our Belief in a Divine Governance of the World" from 1798.)

The Science of Ethics as Based on the Science of Knowledge [1798], trans. A E. Kroeger, London: Kegan Paul, 1897. (German title would be better translated as *The System of Ethical Theory Based on the Wissenschaftslehre*. An unreliable translation.)

The Vocation of Man [1800], trans. Peter Preuss, Indianapolis: Hackett Pub. Co., 1987.

"A Crystal Clear Report to the General Public Concerning the Actual Essence of the Newest Philosophy: An Attempt to Force the Reader to Understand" [1801], trans. John Botterman and William Rasch, in Ernst Behler (ed.) *Philosophy of German Idealism*, New York: Continuum, 1987.

The Popular Works of Johann Gottlieb Fichte, trans. W. Smith, 2 vols., London: Chapman, 1848/9. (Reprint — London: Thoemmes Press, 1999.) (Includes *The Characteristics of the Present Age* and *The Way Towards the Blessed Life*, both from 1806.)

Addresses to the German Nation [1808], trans. R. F. Jones and G. H. Turnbull, Chicago: Open Court, 1922. (Reprint — Westport, CT: Greenwood Press, Inc., 1979.)

"The Science of Knowledge in its General Outline" [1810], trans. Walter E. Wright, *Idealistic Studies* 6 (1976): 106-117.

Sigmund Freud (1856-1939)

Sigmund Freud, physiologist, medical doctor, psychologist and father of psychoanalysis, is generally recognised as one of the most influential and authoritative thinkers of the twentieth century. Working initially in close collaboration with Joseph Breuer, Freud elaborated the theory that the mind is a complex energy-system, the structural investigation of which is proper province of psychology. He articulated and refined the concepts of the unconscious, of infantile sexuality, of repression, and proposed a tri-partite account of the mind's structure, all as part of a radically new conceptual and therapeutic frame of reference for the understanding of human psychological development and the treatment of abnormal mental conditions. Notwithstanding the multiple manifestations of psychoanalysis as it exists today, it can in almost all fundamental respects be traced directly back to Freud's original work. Further, Freud's innovative treatment of human actions, dreams, and indeed of cultural artefacts as invariably possessing implicit symbolic significance has proven to be extraordinarily fecund, and has had massive implications for a wide variety of fields, including anthropology, semiotics, and artistic creativity and appreciation in addition to psychology. However, Freud's most important and frequently re-iterated claim, that with psychoanalysis he had invented a new science of the mind, remains the subject of much critical debate and controversy.

Section Headings:

Life

Freud was born in Frieberg, Moravia in 1856, but when he was four years old his family moved to Vienna, where Freud was to live and work until the last year of his life. In 1937 the Nazis annexed Austria, and Freud, who was Jewish, was allowed to leave for England. For these reasons, it was above all with the city of Vienna that Freud's name was destined to be deeply associated for posterity, founding as he did what was to become known as the 'first Viennese school' of psychoanalysis, from which, it is fair to say, psychoanalysis as a movement and all subsequent developments in this field flowed. The scope of Freud's interests, and of his professional training, was very broad - he always considered himself first and foremost a scientist, endeavouring to extend the compass of human knowledge, and to this end (rather than to the practice of medicine) he enrolled at the medical school at the University of Vienna in 1873. He concentrated initially on biology, doing research in physiology for six years under the great German scientist Ernst Brücke, who was director of the Physiology Laboratory at the University, thereafter specialising in neurology. He received his medical degree in 1881, and having become engaged to be married in 1882, he rather reluctantly took up more secure and financially rewarding work as a doctor at Vienna General Hospital. Shortly after his marriage in 1886 - which was extremely happy, and gave Freud six children, the youngest of whom, Anna, was herself to become a distinguished psychoanalyst - Freud set up a private practice in the treatment of psychological disorders, which gave him much of the clinical material on which he based his theories and his pioneering techniques.

In 1885-86 Freud spent the greater part of a year in Paris, where he was deeply impressed by the work of the French neurologist Jean Charcot, who was at that time using hypnotism to treat hysteria and other abnormal mental conditions. When he returned to Vienna, Freud experimented with hypnosis, but found that its beneficial effects did not last. At this point he decided to adopt instead a method suggested by the work of an older Viennese colleague and friend, Josef Breuer, who had discovered that when he encouraged a hysterical patient to talk uninhibitedly about the earliest occurrences of the symptoms, the latter sometimes gradually abated. Working with Breuer, Freud formulated and developed the idea that many neuroses (phobias, hysterical paralyses and pains, some forms of paranoia, etc.) had their origins in deeply traumatic experiences which had occurred in the past life of the patient but which were now forgotten, hidden from consciousness; the treatment was to enable the patient to recall the experience to consciousness, to confront it in a deep way both intellectually and emotionally, and in thus discharging it, to remove the underlying psychological causes of the neurotic symptoms. This technique, and the theory from which it is derived, was given its classical expression in *Studies in Hysteria*, jointly published by Freud and Breuer in 1895.

Shortly thereafter, however, Breuer, found that he could not agree with what he regarded as the excessive emphasis which Freud placed upon the sexual origins and content of neuroses, and the two parted company, with Freud continuing to work alone to develop and refine the theory and practice of psychoanalysis. In 1900, after a protracted period of self-analysis, he published *The Interpretation of Dreams*, which is generally regarded as his greatest work, and this was followed in 1901 by *The Psychopathology of Everyday Life*, and in 1905 by *Three Essays on the Theory of Sexuality*. Freud's psychoanalytic theory was initially not well received - when its existence was acknowledged at all it was usually by people who were, as Breuer had foreseen, scandalised by the emphasis placed on sexuality by Freud - and it was not until 1908, when the first International Psychoanalytical Congress was held at Salzburg, that Freud's importance began to be generally recognised. This was greatly facilitated in 1909, when he was invited to give a course of lectures in the United States, which were to form the basis of his 1916 book *Five Lectures on Psycho-Analysis*. From this point on Freud's reputation and fame grew enormously, and he continued to write prolifically until his death, producing in all more than twenty volumes of theoretical works and clinical studies. He was also not adverse to critically revising his views, or to making fundamental alterations to his most basic principles when he considered that the scientific evidence demanded it - this was most clearly evidenced by his advancement of a completely new tripartite (*id*, *ego*, and *super-ego*) model of the mind in his 1923 work *The Ego and the Id*. He was initially greatly heartened by attracting followers of the intellectual calibre of Adler and Jung, and was correspondingly disappointed personally when they both went on to found rival schools of psychoanalysis - thus giving rise to the first two of many schisms in the movement - but he knew that such disagreement over basic principles had been part of the early development of every new science. After a life of remarkable vigour and creative productivity, he died of cancer while exiled in England in 1939.

Backdrop to his Thought

Although a highly original thinker, Freud was also deeply influenced by a number diverse factors which overlapped and interconnected with each other to shape the development of his thought. As indicated above, both Charcot and Breuer had a direct and immediate impact upon him, but some of the other factors, though no less important than these, were of a rather different nature. First of all, Freud himself was very much a Freudian - his father had two sons by a previous marriage, Emmanuel and Philip, and the young Freud often played with Philip's son John, who was his own age. Freud's own self-analysis - which forms the core of his masterpiece *The Interpretation of Dreams* - originated in the emotional crisis which he suffered on the death of his father, and the series of dreams to which this gave rise. This analysis revealed to him that the love and admiration which he had felt for his father were mixed with very contrasting feelings of shame and hate (such a mixed attitude he termed 'ambivalence'). Particularly revealing was his discovery that he had often fantasised as a youth that his half-brother Philip (who was of an age with his mother) was really his father, and certain other signs convinced him of the deep underlying meaning of this fantasy - that he had wished his real father dead, because he was his rival for his mother's affections. This was to become the personal (though by no means exclusive) basis for his theory of the Oedipus complex.

Secondly, and at a more general level, account must be taken of the contemporary scientific climate in which Freud lived and worked. In most respects, the towering scientific figure of nineteenth century science was Charles Darwin, who had published his revolutionary *Origin of Species* when Freud was four years old. The evolutionary doctrine radically altered the prevailing conception of man - whereas before man had been seen as a being different in nature to the members of the animal kingdom by virtue of his possession of an immortal soul, he was now seen as being part of the natural order, different from non-human animals only in degree of structural complexity. This made it possible and plausible, for the first time, to treat man as an object of scientific investigation, and to conceive of the vast and varied range of human behaviour, and the motivational causes from which it springs, as being amenable in principle to scientific explanation. Much of the creative work done in a whole variety of diverse scientific fields over the next century was to be inspired by, and derive sustenance from, this new world-view, which Freud, with his enormous esteem for science, accepted implicitly.

An even more important influence on Freud, however, came from the field of physics. The second 50 years of the nineteenth century saw monumental advances in contemporary physics, which were largely initiated by the formulation of the principle of the conservation of energy by Helmholz. This principle states, in effect, that the total amount of energy in any given physical system is always constant, that energy quanta can be changed but not annihilated, and consequently that when energy is moved from one part of the system it must reappear in another part. The progressive application of this principle led to the monumental discoveries in the fields of thermodynamics, electromagneticism, and nuclear physics which, with their associated technologies, have so comprehensively transformed the contemporary world. As we have seen, when he first came to the University of Vienna Freud worked under the direction of Ernst Brücke, who in 1874 published a book setting out the view that all living organisms, including the human

one, are essentially energy-systems to which, no less than to inanimate objects, the principle of the conservation of energy applies. Freud, who had great admiration and respect for Brücke, quickly adopted this new 'dynamic physiology' with enthusiasm. From there it was but a short conceptual step - but one which Freud was the first to take, and on which his claim to fame is largely grounded - to the view that there is such a thing as 'psychic energy', that the *human personality* is also an energy-system, and that it is the function of psychology to investigate the modifications, transmissions, and conversions of 'psychic energy' within the personality which shape and determine it. This latter conception is the very cornerstone of Freud's psychoanalytic theory.

[Return to Section Headings]

The Theory of the Unconscious

Freud's theory of the unconscious, then, is highly deterministic, a fact which, given the nature of nineteenth century science, should not be surprising. Freud was arguably the first thinker to apply deterministic principles systematically to the sphere of the mental, and to hold that the broad spectrum of human behaviour is explicable only in terms of the (usually hidden) mental processes or states which determine it. Thus, instead of treating the behaviour of the neurotic as being causally inexplicable - which had been the prevailing approach for centuries - Freud insisted, on the contrary, on treating it as behaviour for which is meaningful to seek *an explanation* by searching for *causes* in terms of the mental states of the individual concerned. Hence the significance which he attributed to slips of the tongue or pen, obsessive behaviour, and dreams - all, he held, are determined by hidden causes in the person's mind, and so they reveal in covert form what would otherwise not be known at all. This suggests the view that freedom of the will is, if not completely an illusion, certainly more tightly circumscribed than is commonly believed, for it follows from this that whenever we make a choice we are governed by hidden mental processes of which we are unaware and over which we have no control.

The postulate that there *are* such things as unconscious mental states at all is a direct function of Freud's determinism, his reasoning here being simply that the principle of causality *requires* that such mental states should exist, for it is evident that there is frequently nothing in the conscious mind which can be said to cause neurotic or other behaviour. An 'unconscious' mental process or event, for Freud, is not one which merely happens to be out of consciousness at a given time, but is rather one which *cannot*, except through protracted psychoanalysis, be brought to the forefront of consciousness. The postulation of such unconscious mental states entails, of course, that the mind is not, and cannot be, identified with consciousness or that which can be an object of consciousness - to employ a much-used analogy, it is rather structurally akin to an iceberg, the bulk of it lying below the surface, exerting a dynamic and determining influence upon the part which is amenable to direct inspection, the conscious mind.

Deeply associated with this view of the mind is Freud's account of the instincts or drives. The instincts, for Freud, are the principal motivating forces in the mental realm, and as such they 'energise' the mind in all of its functions. There are, he held, an indefinitely large number of such instincts, but these can be reduced to a small number of basic ones, which he grouped into two broad generic categories, *Eros* (the life instinct), which covers all the self-preserving and erotic

instincts, and *Thanatos* (the death instinct), which covers all the instincts towards aggression, self-destruction, and cruelty. Thus it is a mistake to interpret Freud as asserting that *all* human actions spring from motivations which are sexual in their origin, since those which derive from Thanatos are not sexually motivated - indeed, Thanatos is the irrational urge to destroy the source of all sexual energy in the annihilation of the self. Having said that, it is undeniably true that Freud gave sexual drives an importance and centrality in human life, human actions, and human behaviour which was new (and to many, shocking), arguing as he does both that the sexual drives exist and can be discerned in children from birth (the theory of infantile sexuality), and that sexual energy (*libido*) is the single most important motivating force in adult life. However, even here a crucial qualification has to be added - Freud effectively redefined the term 'sexuality' here to make it cover *any form of pleasure* which is or can be derived from the body. Thus his theory of the instincts or drives is essentially that the human being is energised or driven from birth by the desire to acquire and enhance bodily pleasure.

[Return to Section Headings]

Infantile Sexuality

Freud's theory of infantile sexuality must be seen as an integral part of a broader developmental theory of human personality. This had its origins in, and was a generalisation of, Breuer's earlier discovery that traumatic childhood events could have devastating negative effects upon the adult individual, and took the form of the general thesis that early childhood sexual experiences were the crucial factors in the determination of the adult personality. From his account of the instincts or drives it followed that from the moment of birth the infant is driven in his actions by the desire for bodily/sexual pleasure, where this is seen by Freud in almost mechanical terms as the desire to release mental energy. Initially, infants gain such release, and derive such pleasure, through the act of sucking, and Freud accordingly terms this the 'oral' stage of development. This is followed by a stage in which the locus of pleasure or energy release is the anus, particularly in the act of defecation, and this is accordingly termed the 'anal' stage. Then the young child develops an interest in its sexual organs as a site of pleasure (the 'phallic' stage), and develops a deep sexual attraction for the parent of the opposite sex, and a hatred of the parent of the same sex (the 'Oedipus complex'). This, however, gives rise to (socially derived) feelings of guilt in the child, who recognises that it can never supplant the stronger parent. In the case of a male, it also puts the child at risk, which he perceives - if he persists in pursuing the sexual attraction for his mother, he may be harmed by the father; specifically, he comes to fear that he may be castrated. This is termed '*castration anxiety*'. Both the attraction for the mother and the hatred are usually repressed, and the child usually resolves the conflict of the Oedipus complex by coming to identify with the parent of the same sex. This happens at the age of five, whereupon the child enters a 'latency' period, in which sexual motivations become much less pronounced. This lasts until puberty, when mature genital development begins, and the pleasure drive refocuses around the genital area.

This, Freud believed, is the sequence or progression implicit in *normal* human development, and it is to be observed that at the infant level the instinctual attempts to satisfy the pleasure drive are frequently checked by parental control and social coercion. The developmental process, then, is for

the child essentially a movement through a series of *conflicts*, the successful resolution of which is crucial to adult mental health. Many mental illnesses, particularly hysteria, Freud held, can be traced back to unresolved conflicts experienced at this stage, or to events which otherwise disrupt the normal pattern of infantile development. For example, homosexuality is seen by some Freudians as resulting from a failure to resolve the conflicts of the Oedipus complex, particularly a failure to identify with the parent of the same sex; the obsessive concern with washing and personal hygiene which characterises the behaviour of some neurotics is seen as resulting from unresolved conflicts/repressions occurring at the anal stage.

[Return to Section Headings]

Neuroses and The Structure of the Mind

Freud's account of the unconscious, and the psychoanalytic therapy associated with it, is best illustrated by his famous tripartite model of the structure of the mind or personality (although, as we have seen, he did not formulate this until 1923), which has many points of similarity with the account of the mind offered by Plato over 2,000 years earlier. The theory is termed 'tripartite' simply because, again like Plato, Freud distinguished three structural elements within the mind, which he called *id*, *ego*, and *super-ego*. The *id* is that part of the mind in which are situated the instinctual sexual drives which require satisfaction; the *super-ego* is that part which contains the 'conscience', viz. socially-acquired control mechanisms (usually imparted in the first instance by the parents) which have been internalised; while the *ego* is the conscious self created by the dynamic tensions and interactions between the *id* and the *super-ego*, which has the task of reconciling their conflicting demands with the requirements of external reality. It is in this sense that the mind is to be understood as a dynamic energy-system. All objects of consciousness reside in the *ego*, the contents of the *id* belong permanently to the unconscious mind, while the *super-ego* is an unconscious screening-mechanism which seeks to limit the blind pleasure-seeking drives of the *id* by the imposition of restrictive rules. There is some debate as to how literally Freud intended this model to be taken (he appears to have taken it extremely literally himself), but it is important to note that what is being offered here is indeed *a theoretical model*, rather than a description of an observable object, which functions as a frame of reference to explain the link between early childhood experience and the mature adult (normal or dysfunctional) personality.

Freud also followed Plato in his account of the nature of mental health or psychological well-being, which he saw as the establishment of a harmonious relationship between the three elements which constitute the mind. If the external world offers no scope for the satisfaction of the *id's* pleasure drives, or, more commonly, if the satisfaction of some or all of these drives would indeed transgress the moral sanctions laid down by the *super-ego*, then an inner conflict occurs in the mind between its constituent parts or elements - failure to resolve this can lead to later neurosis. A key concept introduced here by Freud is that the mind possesses a number of 'defence mechanisms' to attempt to prevent conflicts from becoming too acute, such as *repression* (pushing conflicts back into the unconscious), *sublimation* (channelling the sexual drives into the achievement socially acceptable goals, in art, science, poetry, etc.), *fixation* (the failure to progress beyond one of the developmental stages), and *regression* (a return to the behaviour characteristic of one of the stages).

Of these, repression is the most important, and Freud's account of this is as follows: when a person experiences an instinctual impulse to behave in a manner which the *super-ego* deems to be reprehensible (e.g. a strong erotic impulse on the part of the child towards the parent of the opposite sex), then it is possible for the mind push it away, to *repress* it into the unconscious. Repression is thus one of the central defence mechanisms by which the ego seeks to avoid internal conflict and pain, and to reconcile reality with the demands of both *id* and *super-ego*. As such it is completely normal and an integral part of the developmental process through which every child must pass on the way to adulthood. However, the repressed instinctual drive, as an energy-form, is not and cannot be *destroyed* when it is repressed - it continues to exist intact in the unconscious, from where it exerts a determining force upon the conscious mind, and can give rise to the dysfunctional behaviour characteristic of neuroses. This is one reason why dreams and slips of the tongue possess such a strong symbolic significance for Freud, and why their analysis became such a key part of his treatment - they represent instances in which the vigilance of the *super-ego* is relaxed, and when the repressed drives are accordingly able to present themselves to the conscious mind in a transmuted form. The difference between 'normal' repression and the kind of repression which results in neurotic illness is one of *degree*, not of kind - the compulsive behaviour of the neurotic is itself a behavioural manifestation of an instinctual drive repressed in childhood. Such behavioural symptoms are highly irrational (and may even be perceived as such by the neurotic), but are completely beyond the control of the subject, because they are driven by the now unconscious repressed impulse. Freud positioned the key repressions, for both the normal individual and the neurotic, in the first five years of childhood, and, of course, held them to be essentially sexual in nature - as we have seen, repressions which disrupt the process of infantile sexual development in particular, he held, lead to a strong tendency to later neurosis in adult life. The task of psychoanalysis as a therapy is to find the repressions which are causing the neurotic symptoms by delving into the unconscious mind of the subject, and by bringing them to the forefront of consciousness, to allow the ego to confront them directly and thus to discharge them.

[Return to Section Headings]

Psychoanalysis as a Therapy

Freud's account of the sexual genesis and nature of neuroses led him naturally to develop a clinical treatment for treating such disorders. This has become so influential today that when people speak of 'psychoanalysis' they frequently refer exclusively to the clinical treatment; however, the term properly designates both the clinical treatment and the theory which underlies it. The aim of the method may be stated simply in general terms - to re-establish a harmonious relationship between the three elements which constitute the mind by excavating and resolving unconscious repressed conflicts. The actual method of treatment pioneered by Freud grew out of Breuer's earlier discovery, mentioned above, that when a hysterical patient was encouraged to talk freely about the earliest occurrences of her symptoms and fantasies, the symptoms began to abate, and were eliminated entirely she was induced to remember the initial trauma which occasioned them. Turning away from his early attempts to explore the unconscious through hypnosis, Freud further developed this 'talking cure', acting on the assumption that the repressed conflicts were buried in the deepest recesses of the unconscious mind. Accordingly, he got his patients to relax in a position in which they were deprived of strong sensory stimulation, even of keen awareness of the presence

of the analyst (hence the famous use of the couch, with the analyst virtually silent and out of sight), and then encouraged them to speak freely and uninhibitedly, preferably without forethought, in the belief that he could thereby discern the unconscious forces lying behind what was said. This is the method of 'free-association', the rationale for which is similar to that involved in the analysis of dreams - in both cases the *super-ego* is to some degree disarmed, its efficiency as a screening mechanism is moderated, and material is allowed to filter through to the conscious *ego* which would otherwise be completely repressed. The process is necessarily a difficult and protracted one, and it is therefore one of the primary tasks of the analyst to help the patient to recognise, and to overcome, his own natural resistances, which may exhibit themselves as hostility towards the analyst. However, Freud always took the occurrence of resistance as a sign that he was on the right track in his assessment of the underlying unconscious causes of the patient's condition. The patient's dreams are of particular interest, for reasons which we have already partly seen. Taking it that the *super-ego* functioned less effectively in sleep, as in free association, Freud made a distinction between the *manifest* content of a dream (what the dream appeared to be about on the surface) and its *latent* content (the unconscious, repressed desires or wishes which are its real object). The correct interpretation of the patient's dreams, slips of tongue, free-associations, and responses to carefully selected questions leads the analyst to a point where he can locate the unconscious repressions producing the neurotic symptoms, invariably in terms of the patient's passage through the sexual developmental process, the manner in which the conflicts implicit in this process were handled, and the libidinal content of his family relationships. To effect a cure, he must facilitate the patient himself to become conscious of unresolved conflicts buried in the deep recesses of the unconscious mind, and to confront and engage with them directly.

In this sense, then, the object of psychoanalytic treatment may be said to be a form of self-understanding - once this is acquired, it is largely up to the patient, in consultation with the analyst, to determine how he shall handle this newly-acquired understanding of the unconscious forces which motivate him. One possibility, mentioned above, is the channelling of the sexual energy into the achievement of social, artistic or scientific goals - this is sublimation, which Freud saw as the motivating force behind most great cultural achievements. Another would be the conscious, rational control of the formerly repressed drives - this is suppression. Yet another would be the decision that it is the *super-ego*, and the social constraints which inform it, which are at fault, in which case the patient may decide in the end to satisfy the instinctual drives. But in all cases the cure is effected essentially by a kind of catharsis or purgation - a *release* of the pent-up psychic energy, the constriction of which was the basic cause of the neurotic illness.

[Return to Section Headings]

Critical Evaluation of Freud

It should be evident from the foregoing why psychoanalysis in general, and Freud in particular, have exerted such a strong influence upon the popular imagination in the Western World over the past 90 years or so, and why both the theory and practice of psychoanalysis should remain the object of a great deal of controversy. In fact, the controversy which exists in relation to Freud is more heated and multi-faceted than that relating to virtually any other recent thinker (a possible exception being Darwin), with criticisms ranging from the contention that Freud's theory was

generated by logical confusions arising out of his alleged long-standing addiction to cocaine (Cf. Thornton, E.M. *Freud and Cocaine: The Freudian Fallacy*) to the view that he made an important, but grim, empirical discovery, which he knowingly suppressed in favour of the theory of the unconscious, knowing that the latter would be more acceptable socially (Cf. Masson, J. *The Assault on Truth*).

It should be emphasised here that Freud's genius is not (generally) in doubt, but the precise nature of his achievement is still the source of much debate. The supporters and followers of Freud (and Jung and Adler) are noted for the zeal and enthusiasm with which they espouse the doctrines of the master, to the point where many of the detractors of the movement see it as a kind of secular religion, requiring as it does an initiation process in which the aspiring psychoanalyst must himself first be analysed. In this way, it is often alleged, the unquestioning acceptance of a set of ideological principles becomes a necessary precondition for acceptance into the movement - as with most religious groupings. In reply, the exponents and supporters of psychoanalysis frequently analyse the motivations of their critics in terms of the very theory which those critics reject. And so the debate goes on.

Here we will confine ourselves to: (a) the evaluation of Freud's claim that his theory is a scientific one, (b) the question of the theory's coherence, (c) the dispute concerning what, if anything, Freud really discovered, and (d) the question of the efficacy of psychoanalysis as a treatment for neurotic illnesses.

(a) The Claim to Scientific Status

This is a crucially important issue, since Freud not alone saw himself first and foremost as a pioneering scientist, but repeatedly asserted that the significance of psychoanalysis is that it is a *new science*, incorporating a new scientific method of dealing with the mind and with mental illness. And there can be no doubt but that this has been the chief attraction of the theory for most of its advocates since then - on the face of it, it has the appearance of being, not just a scientific theory, but an enormously *strong* scientific theory, with the capacity to accommodate, and explain, every possible form of human behaviour. However, it is precisely this latter which, for many commentators, undermines its claim to scientific status. On the question of what makes a theory a genuinely scientific one, Karl Popper's criterion of demarcation, as it is called, has now gained very general acceptance: viz. that every genuine scientific theory must be testable, and therefore *falsifiable*, at least in principle - in other words, if a theory is incompatible with *possible* observations it is scientific; conversely, a theory which is compatible with *all* possible observations is unscientific (Cf. Popper, K. *The Logic of Scientific Discovery*). Thus the principle of the conservation of energy, which influenced Freud so greatly, is a scientific one, because it is falsifiable - the discovery of a physical system in which the total amount of energy was not constant would conclusively show it to be false. And it is argued that nothing of the kind is possible with respect to Freud's theory - if, in relation to it, the question is asked: 'What does this theory imply which, if false, would show the whole theory to be false?', the answer is 'nothing', the theory is compatible with *every possible* state of affairs - it cannot be falsified by anything, since it purports to explain everything. Hence it is concluded that the theory is not scientific, and while this does not,

as some critics claim, rob it of all value, it certainly diminishes its intellectual status, as that was and is projected by its strongest advocates, including Freud himself.

[Return to Section Headings]

(b) The Coherence of the Theory

A related (but perhaps more serious) point is that the coherence of the theory is, at the very least, questionable. What is attractive about the theory, even to the layman, is that it seems to offer us long sought-after, and much needed, *causal explanations* for conditions which have been a source of a great deal of human misery. The thesis that neuroses are caused by unconscious conflicts buried deep in the unconscious mind in the form of repressed libidinal energy would appear to offer us, at last, an insight in the causal mechanism underlying these abnormal psychological conditions as they are expressed in human behaviour, and further show us how they are related to the psychology of the 'normal' person. However, even this is questionable, and is a matter of much dispute. In general, when it is said that an event X causes another event Y to happen, both X and Y are, and must be, *independently identifiable*. It is true that this is not always a simple process, as in science causes are sometimes unobservable (sub-atomic particles, radio and electromagnetic waves, molecular structures, etc.), but in these latter cases there are clear 'correspondence rules' connecting the unobservable causes with observable phenomena. The difficulty with Freud's theory is that it offers us entities (repressed unconscious conflicts, for example) which are said to be the unobservable causes of certain forms of behaviour, but there are *no* correspondence rules for these alleged causes - they cannot be identified *except* by reference to the behaviour which they are said to cause (i.e. the analyst does not demonstratively assert: '*This* is the unconscious cause, and *that* is its behavioural effect'; he asserts: '*This* is the behaviour, therefore its unconscious cause *must* exist'). And this does raise serious doubts as to whether Freud's theory offers us genuine causal explanations at all.

[Return to Section Headings]

(c) Freud's Discovery?

At a less theoretical, but no less critical level, it has been alleged that Freud did make a genuine discovery, which he was initially prepared to reveal to the world, but the response which he encountered was so ferociously hostile that he masked his findings, and offered his theory of the unconscious in its place (Cf. Masson, J. *The Assault on Truth*). What he discovered, it has been suggested, was the extreme prevalence of child sexual abuse, particularly of young girls (the *vast* majority of hysterics are women), even in respectable nineteenth century Vienna. He did in fact offer an early 'seduction theory' of neuroses, which met with fierce animosity, and which he quickly withdrew, and replaced with theory of the unconscious. As one contemporary Freudian commentator explains it, Freud's change of mind on this issue came about as follows:

> **Questions concerning the traumas suffered by his patients seemed to reveal [to Freud]**

> **that Viennese girls were extraordinarily often seduced in very early childhood by older male relatives; doubt about the actual occurrence of these seductions was soon replaced by certainty that it was descriptions about childhood fantasy that were being offered. (MacIntyre).**

In this way, it is suggested, the theory of the Oedipus complex was generated.

This statement begs a number of questions, not least, what does the expression 'extraordinarily often' mean in this context? By what *standard* is this being judged? The answer can only be: by the standard of what we generally believe - or would like to believe - to be the case. But the contention of some of Freud's critics here is that his patients were not recalling childhood *fantasie*s, but traumatic events in their childhood which were all too *real,* and that he had stumbled upon, and knowingly suppressed, the fact that the level of child sexual abuse in society is much higher than is generally believed or acknowledged. If this contention is true - and it must at least be contemplated seriously - then this is undoubtedly the most serious criticism that Freud and his followers have to face.

Further, this particular point has taken on an added, and even more controversial significance in recent years with the willingness of some contemporary Freudians to *combine* the theory of repression *with* an acceptance of the wide-spread social prevalence of child sexual abuse. The result has been that, in the United States and Britain in particular, many thousands of people have emerged from analysis with 'recovered memories' of alleged childhood sexual abuse by their parents, memories which, it is suggested, were hitherto repressed. On this basis, parents have been accused and repudiated, and whole families divided or destroyed. Unsurprisingly, this in turn has given rise to a systematic backlash, in which organisations of accused parents, seeing themselves as the true victims of what they term 'False Memory Syndrome', have denounced all such memory-claims as falsidical, the direct product of a belief in what they see as the myth of repression. (Cf. Pendergast, M. *Victims of Memory*). In this way, the concept of repression, which Freud himself termed 'the foundation stone upon which the structure of psychoanalysis rests', has come in for more widespread critical scrutiny than ever before. Here, the fact that, unlike some of his contemporary followers, Freud did not himself ever countenance the extension of the concept of repression to cover actual child sexual abuse, and the fact that we are not necessarily forced to choose between the views that all 'recovered memories' are either veridical or falsidical, are, perhaps understandably, frequently lost sight of in the extreme heat generated by this debate.

[Return to Section Headings]

(d) The Efficacy of Psychoanalytic Therapy

On this question, the situation is equally complex. For one thing, it does not follow that if Freud's theory is unscientific, or even false, that it cannot provide us with a basis for the beneficial treatment of neurotic illness, for the relationship between a theory's truth or falsity and its utility-value is far from being an isomorphic one. (The theory upon which the use of leeches to bleed patients in eighteenth century medicine was based was quite spurious, but patients did sometimes actually benefit from the treatment!). And of course even a true theory might be badly

applied, leading to negative consequences. One of the problems here is that is difficulty to specify what counts as a *cure* for a neurotic illness, as distinct, say, from a mere alleviation of the symptoms. In general, however, the efficiency of a given method of treatment is usually clinically measured by means of a 'control group' - the proportion of patients suffering from a given disorder who are cured by treatment X is measured by comparison with those cured by other treatments, or by no treatment at all. Such clinical tests as have been conducted indicate that the proportion of patients who have benefited from psychoanalytic treatment does not diverge significantly from the proportion who recover spontaneously or as a result of other forms of intervention in the control groups used. So the question of the therapeutic effectiveness of psychoanalysis remains an open and controversial one.

Functionalism

Functionalism is a theory in the philosophy of mind which, most simply, holds that mental states are functional states. Specifically, mental states are understood by their relations to (a) their sensory stimulation or input, (b) other inner states, and (c) their behavior effects. Suppose, for example, I experience pain by placing my hand too close to a hot stove. My pain is understood in reference to (a) the physical stimulation I receive from the hot stove, (b) its causal impact on other mental states I have, such as worry, and (c) behavioral effects I exhibit, such as saying "ouch". The most distinctive feature of functionalism is that it implies that human mental states are not restricted to human biological systems, such as brains. Non-biological systems which exhibit the same functional relationships as humans do, such as systems of computer chips, can be said to have the same mental state. As such, mental states are not based on the intrinsic properties of the mental state in question, such as the stuff it is made of. The same state may be shared by things with different physical makeups, thereby distinguishing between the role which a mental state plays, and the occupant in which the state exists. The hardware/software distinction, borrowed from computer science, is a useful metaphor to explain the difference between the bodily occupant and mental event experienced. Although functionalists associate themselves with materialistic monism (that is, the view that only material things exist), there is a dualism lurking beneath the surface. For, since any given mental state cannot be reduced to the physical mechanism which produces it (whether neurological or silicon-based), then mental states must be something more than the merely physical.

Functionalism may be contrasted both to behaviorism and identity theory in its account of mental events. Behaviorism defines mental events solely in relation to sensory input and behavioral output. Unfortunately, this includes any input/output device, such as a mousetrap, to which we would not want to attribute mental states. However, in addition to input and output relations, functionalism also acknowledges causal relations with other internal mental states, which mousetraps do not exhibit (such as the mental state of worry). Identity theory restricts mental events to brain activity. Functionalism, by contrast, acknowledges that mental events may be instantiated in systems or machines other than brains.

There are several different types of functionalism, each based on different models; these include Turing machine functionalism, causal theory of mind, and teleological (homuncular) functionalism. Turing machine functionalism, proposed by Hilary Putnam, uses as its model a special theoretical mechanical device (the Turing machine). Most succinctly, the machine (a) receives input, (b) carries out the instructions of the input program, (c) changes its internal state, and (d) produces an appropriate output based on the input and instructions. A pop machine, for example, shows these features insofar as it has instructions on various acceptable inputs with various associated behavioral outputs. Based on this model, Putnam argues that humans are probablistic automatons.

A second type of functionalism, defended by David Armstrong and David Lewis, involves a causal theory of mind. Mental states are defined by a common sense understanding of the situations in which they appear and the behavior that is elicited. In his essay "Mad Pain and Martian Pain", Lewis hypothesizes about two kinds of beings which experience pain differently than normal humans. In the case of mad pain, the subject experiences pain when doing moderate exercise on an empty stomach; further it improves his concentration for mathematical reasoning. Martian pain, by contrast, takes place in a Martain organism constructed of hydrolic hardware rather than neurons. Lewis''s point is that pain is associated only contingently with either its causes (as in mad pain) or its physical realization (as in Martian pain). We cannot specify *a priori* its causal role or physical realization.

A third type of functionalism, associated with William G. Lycan and Daniel Dennett, breaks mental states down into a hierarchy resembling that of a large corporation. This includes cooperating units, sub-units, sub-sub-units, and so on, until a neurological level is reached which simply reduces to a series of on-off switches. On this view, the pattern of on-off switches can be instantiated in a variety of non-biological mechanisms, such as computers.

The main problem with all types of functionalism is that they approach mental states in a purely relational way. One criticism focuses on a hypothetical situation in which someone perceives an inverted light spectrum. For example, person A perceives red when person B perceives green. Although they both function precisely the same with regard to input, related internal states, and behavior, they clearly have different *qualitative* mental states (qualia). However, a functionalist might reply to this charge maintaining that what is central to functionalism is how people discriminate between colors, not their qualia. A second criticism of functionalism hypothesizes that if we could create an android which is functionally the same as a human, but lacks qualia, then functionalism would be incomplete or false. To this the functionalist might respond that we should be able to make an android out of some physical stuff which has qualia (since its type of constituent physical stuff should not make a difference). A third criticism is that functionalism is too narrow (or chauvinistic) in the kinds of things that are capable of having mental states. Specifically, functionalism seems to be dependent on physicalism, insofar as only physical things (biological, silicon, etc.) can house functional mental states. This leaves out non-physical mental beings, such as disembodied spirits.

Galileo (1564-1642)

Galileo, Italian physicist and astronomer, was born at Pisa February 15, 1564 and died at Arcetri, near Florence, January 8, 1642. In 1581 he entered the University of Pisa to study medicine and the Aristotelian philosophy, but soon abandoned medicine for mathematics and physical science. In 1585 he left the university and went to Florence to study under Otilio Ricci. He was professor of mathematics at Pisa 1589-91, and at Padua 1592-1610, lecturing there to crowds of enthusiastic pupils from all over Europe. In 1610 Cosmo II, grand duke of Tuscany, appointed him philosopher and mathematician at the Florentine court, thus relieving him of all academic routine and enabling him to devote himself entirely to his scientific investigations.

Galileo's opposition to the Ptolemaic cosmology first brought him under the suspicion of the Inquisition in 1611, though he continued his investigations and publicly defended the Copernican system. In a letter to Ms friend Father Castelli, dated Dec. 21, 1613, he maintained that the theologian, instead of trying to restrict scientific investigation on Biblical grounds, should make it his business to reconcile the phraseology of the Bible with the results of science. In 1615 a copy of this letter was produced before the Inquisition, with the result that the following year Galileo was warned by the pope to desist from his heretical teachings on the pain of imprisonment. In 1632 he again drew the attention of the Inquisition by publishing a defense of the Copernican system. After a long and wearisome trial he was condemned on June 22, 1633, solemnly to abjure his scientific creed on bended knees. This he did under threats of torture; but whether he was actually put to the torture is still a mooted question. He was also sentenced to indeterminate imprisonment, but this was soon commuted to residence at Sienna, and the following December he was allowed to return to his villa at Arcetri, though he remained under the surveillance of the Inquisition. In 1637 he became totally blind.

Galileo's chief contributions to science are his formulation of the laws governing failing bodies, the invention of the telescope, the discovery of the isochronism of the pendulum, and numerous astronomical discoveries, including the phases of Venus, four satellites of Jupiter, and the spots on the sun. His works were stricken from the Index in 1835. The most important are *The System of the World, in Four Dialogues* (Florence, 1632); and *Mathematical Discourses and demonstrations touching two new Sciences* (Leyden, 1638).

German Idealism

The Movement Characterized. The term "German Idealism" refers to a phase of intellectual life that had its origin in the Enlightenment as modified by German conditions. English and French representatives of the Enlightenment, giving precedence to sensation, had become empiricists and skeptics. They viewed the world as a great machine, adopted hedonism as their ethics, and interpreted history from a subjective-critical point of view. The situation in Germany was just the reverse. There thought was given precedence over sensation, and, instead of empiricism, idealism was dominant. Ethics was based on norms of universal validity, instead of on individual whim. History was interpreted genetically as a rational process; and in place of the mechanical conception of the world, an organic or dynamic view was substituted. Nature was seen to be spiritual, as well as spatial, and was interpreted teleologically. In the hands of Jacobi and Kant, Hume's skepticism became the weapon that destroyed the influence of empiricism and thus paved the way for idealism. For the Germans, at least, Rousseau's radicalism brought into question the value of the culture-ideals of the Enlightenment, and impelled them to seek the basis of culture in the creative power of the mind. For the philosopher German idealism usually means the philosophy of Kant and his immediate followers, while for the historian of literature it may seem little more than the personality of Goethe; and it is not usual to characterize the literary aspect of the movement as neo-humanism. However, there is a unity in the movement that cannot be ignored. All its varied manifestations, whether in science, philosophy, literature, art, or social life, are properly treated under the title *German Idealism*

Leibniz and the Pietists. Several factors contributed to the peculiarly independent character of the Enlightenment in Germany. Most notable was the influence of Liebniz and that of the Pietists. Leibniz was an essentially religious personality, and in transplanting the spirit of the Enlightenment into Germany he gave it that distinctively ethical and religious flavor which became characteristic of German Idealism. It was he who was chiefly instrumental in substituting the mechanical view of nature with a teleological one. He transformed the atoms of the materialists into monads, or psychical entities, and substituted for natural law his theory of preestablished harmony. He asserted the absolute worth of the individual against the destructive monistic pantheism of Spinoza, and saw in the progress of history a movement of the monads towards some divine end. On the one hand, he made the development of materialism and skepticism impossible in Germany, and, on the other hand, he brought about the teleological explanation of the history of the universe as a whole. The teleological and idealistic tendencies of Leibniz were strengthened through Pietism; Klopstock, Herder, Jacobi, Goethe, and Jean Paul, all betray in their works the Pietistic influence.

Kant's Transcedentalism. **The conceptual framework of German Idealism was provided by Immanuel Kant who was the first to reconcile the conflicting empirical and rationalistic elements of the prevailing dogmatic philosophy. With one stroke he secured for mind priority over nature, and yet without endangering the validity of the principles of scientific investigation. By giving the primacy to practical reason, he placed religion and ethics on a sure footing and broke the ban of rationalism. In the first instance Kant's work was purely epistemological. He made it particularly his problem to rescue natural science from the (epistemological) skepticism of Hume, and then to rescue religion from nationalism. Kant demolished the rationalistic arguments of Anselm, Descartes, and others, for the existence of God. Science is valid, but it has to do only with phenomena. This phenomenal world, however, is produced *a priori* by the activity of consciousness, reacting on that external reality whose eternal nature cannot be known. The constancy of experience is accounted for by the very fact that the world as we know it is only the sum total of phenomena. This becomes the basis of the universal validity of certain principles of explanation. Space and time, and the categories of the understanding are subjective and thus ideal. Taken together they form a mold in which we shape the impressions coming from the unknowable, transcendent reality. Thus, the principles of science and the laws of nature are universally valid because they are in the subject, not in the object. Knowledge of ultimate reality comes through the practical reason, particularly through the *a priori* moral law in us. Kant's idea of inner freedom became the inspiration of the creative genius. The phase of German Idealism manifested in the art and poetry of the period has been called aesthetic-ethical idealism. The leaders of this artistic movement, who really popularized idealism and made it a part of the life of the time, were not intent on solving the old philosophical problems. For conceptual thought they substituted the creative imagination.**

Lessing, Herder, and Others. **Klopstock and Wieland mark the turning-point toward idealsm. However, their contemporary, Lessing, was the first representative of the movement to liberate himself completely from conventional theology and all that was arbitrary and external in German culture and find in the inner aesthetic and ethical development of the mind the ideal to be followed. Idealism in the sense in which the word is here used became even more effective in the work of Herder. His break with the Enlightenment was complete. In his large application of the idealistic method to the interpretation of science, art, and history, he practically reformed all the intellectual sciences. He, too, proceeded from an analysis of the poetic and artistic impulse, and in the creative activity of the mind he found the key to ethics, aesthetics, and religion. From this subjective, or idealistic, view-point he saw the panorama of history as a spiritualistic development. If Lessing's great work was to introduce idealism into aesthetics, particularly the aesthetics of dramatic poetry, Herder's greatest service to the idealistic cause was his application of idealism, as a method, to the interpretation of history. What Wieland, Lessing, and others had done for poetic art, this Winckelmann did for plastic art. He too found in the conception of the free creative mind the basis of ethics, aesthetics, and religion.**

Goethe, Schiller, and Others. **The great representatives of the idealistic type mind in German poetry were Goethe, and Schiller. Against the exclusive claims of the aesthetic view of nature, and a morality essentially classical, Goethe emphasizes the moral and religious worth of the individual, thus approaching the ethical teachings of Kant. Schiller combined the epistemology of Kant with the pantheism of Goethe. With him aesthetic values were the chief types of intellectual**

norms. Thus, his ethics and religion might be regarded as a phase of aesthetics. However, the aesthetic harmony that he found in the universe had an impact on his ethical and religious nature; despite his aesthetic view-point, he must be classed with Kant and Fichte as one of the great moral teachers of Germany. Schiller's only consistent follower was Willhelm von Humboldt, who was instrumental in bringing about the Neo-Humanistic reform, on the basis of the new aesthetic-ethical culture. Jean Paul was a representative of the anti-classical type of idealism.

Early Views of Fichte and Schelling.

The basis of the aesthetic-ethical movement was Kant transcendental idealism. But while Kant made the idealistic position secure, he had not accounted for the reality of the world of nature, with all that it means to the poet as the expression of some divine purpose. To get at the bottom of the matter, it was felt that human consciousness as a starting-point would have to be abandoned and an absolute consciousness posited. From this reality of absolute consciousness, then, individual consciousness could be deduced in a manner, analogous to that employed by Kant. The first to attempt such a comprehensive solution of the problem was Johann Gottlieb Fichte. Starting from Kant's idealistic position he tried to overcome the dualism involved in Kant's doctrine of a (thing in itself) by bringing this mysterious reality into consciousness. To do this he dropped the Kantian distinction between practical and theoretical reason, and conceived of the absolute mind, or ego, as moral reason. In his view all existence is psychical, and the human mind is only a manifestation of the absolute ego. Thus, the last trace of an unknowable transcendent reality is obliterated. The absolute ego has divided itself into a large number of relative egos, and through these it is moving progressively toward its own destiny. The core of reality lies in human personality, in the finite mind, but this is caught up in an endless process of development; Hence, to transcend his own consciousness and explain the progress of history, with reference to the past and future, the philosopher must look at existence from the point of view of the absolute ego. In this way Fichte developed his subjective realism, bringing this scheme of idealistic evolution every phase of human experience. Under his treatment, ethics, sociology, aesthetics, and religion become a part of the history of the Absolute. He overcame the dualism between individual mind and nature by dissolving both individual nature and mind. Schelling, starting from the Kant-Fichte point of view, extended the conception of the Absolute to objective nature. His system may be characterized as a sort of spiritualized pantheism. The world is a continuous process from inorganic unconscious nature to organic conscious nature, and then from organic nature back to inorganic nature. While in humans the Absolute reaches consciousness, nature remains essentially objective, but not in a materialistic sense. Nature, for Schelling, is a system of spiritual forces similar to the monads of Leibniz. Schelling worked out his so - called *Identitatsphilosophie* by extending to absolute consciousness the view that in consciousness subject and object are identical. The sum total of existence then becomes the Absolute as perceived by itself. Naturally, all distinctions and qualities, which are created by a finite relational consciousness, disappear in a self-contemplation of the Absolute by itself, and existence becomes neutral. If Fichte had interpreted existence ethically, Schelling interprets it aesthetically. While with Fichte the Absolute distributes itself in finite minds in order to work out its own moral development, with Schelling the Absolute comes to consciousness in humans in order that we may enjoy the aesthetic contemplation of the unity of mind and nature, the identity of mind with its sensuous content.

Romanticism. The immediate result of the metaphysical systems of Fichte and Schelling was a revival of poetic production and criticism known as Romanticism, which sprang from the school of Goethe and Schiller. The union of poetry with the metaphysical or religious view of life became a recognized principle of art; and it was this combination that secured for idealism the final triumph over the narrow naturalism and rationalism of the Enlightenment. Romanticism brought to light the connection of poetry with Christianity. Just as Schiller had taken Kant's epistemology as a basis for the explanation of the relation of aesthetics to ethics, so now the Kantian position was used to explain the relation of religion to aesthetics. Thus, from Kant's idealism came a new analysis of religion, illuminating with a new light the problems of culture. Romanticism gave depth to the historical view and dissolved into thin air those time-worn conceptions of a "law of nature," "common sense," and innate norms of the reason; this was just as the Enlightenment had formerly disposed of the idea of a supernatural, ecclesiastical norm, which rested on these conceptions. The leading spirits in the romantic movement were the two Schlegels, though Fichte, Schleiermacher, Hegel, Schelling, Novalis, and many others took a part in it. Out of Romanticism sprang a new impulse for systematic thinking; and through the political catastrophes of the time and the moral earnestness of the intellectual leaders, idealistic speculation was forced to apply its norms to practical social problems.

Later Views of Fichte and Schelling. The first to feel the pressure of the realistic-historical problems were the founders of metaphysical idealism, Fichte and Schelling. Both betray the influence of Schleiermacher. Realizing the inadequacy of their philosophy to meet practical needs, they now sought an ethical and religious ideal which should unify the concrete content of spiritual life and at the same time be a necessary deduction from the metaphysical background of existence. Fichte retained his idea of the moral state as the consummation of the historical process. However, he no longer considered this state merely as a postulate of progressive freedom, but as a concrete civilized state, in which all members of society share in the blessings of religion, morality, and art. In this remodeled view of Fichte, religion is dominant; for he finds that only religious faith makes possible the realization of the moral idea, and thus the reality of the external world. The world is ethical. It is religious faith that gives an ultimate aim to ethical conduct, that makes possible a union of the empirical ego with its metaphysical basis, that is, God. His ethics is thus deprived of its formal character as an endless progress and given a definite aim. This ethical and religious view necessitates a modification of his metaphysics. The background of empirical consciousness is no longer an endless progression of the Absolute, but a fixed and unchanging divine being. In this being the empirical ego has its origin, and through ethical conduct it returns to its source. Similarly, in view of moral and aesthetic needs, Schelling was forced to change his views. In applying the principle of identity, he destroyed the variety of existence, and thus its reality. In describing the universe as a quality-less *neutrum* he had only caricatured the Absolute. His philosophy disagreed with every phase of experience. Just as Fichte, so Schelling sought in religion the key to the origin and destiny of humans. The phenomenal world takes its rise in the absolute, self-determined will of God. Because of its origin, the phenomenal world necessarily works its way back up to God again. This movement back to God is a religious process, through mythology, or natural religion, up to Christianity, at which stage the union of man with God takes place. Thus, Christianity, whose dogmas are interpreted evolutionistically by Schelling, becomes the end and purpose of history; and it is upon Christianity that ethics, politics, and aesthetics are to be based.

Hegel's System. If Fichte and Schelling tried to find the purpose of existence in some concrete content (such as the moral state or the Christian religion, deducing this concept from the conception of God), Hegel solved the problem by a systematic exploitation of the conception of evolution, which with him was both a constituent and a teleological principle. The conception had been variously and obscurely employed by Leibniz, Lessing, Kant, Herder, Goethe, Schiller, and F. Schlegel. Then, on the basis of Kant's transcendental deduction, Fichte and Schelling interpreted the process of development in a purely idealistic manner as the unconscious opposition of the Absolute to itself; this further entailed the conscious and gradual removal of this opposition by self-absorption, the double process following necessarily from the very nature of mind. Hegel makes the impulse of the absolute mind a gradual and self-determined process, by which the Absolute lifts itself from mere possibility and actuality to conscious, free, and necessary possession. Viewed *sub specie aeternitatis* the whole process is timeless, and only to a finite mind does it appear as an endless procession in time and space. However, it is just in this finite view that the ethical, aesthetic and religious character of Hegel's philosophy manifests itself. In the finite consciousness there is a separation of the natural, the actual, and the empirical from the spiritual, the free, and the necessary. In the unity reached by overcoming this divorce of the finite from the infinite lies religious blessedness, perfect beauty, and moral freedom. Every phase and stage of this inner teleological development is necessary to the life of the Absolute, and all variety in finite experience is preserved in the higher unity. Nothing is lost. Instead of being an undifferentiated substance, or a qualityless *neutrum*, the Absolute is the living, vital reality that manifests itself in human experience. This reality is spiritual , and the guiding principle of its upward movement is the fulfillment of its own divine purpose, which is religious, ethical, aesthetic. Religion and ethics are thus a necessary product of the self-explication of the Absolute, or God.

Schleiermacher. The religious turn that idealistic metaphysics had taken was due to the influence of Schleiermacher, the most specifically religious of all the great philosophers. In his own system he made use of the religious consciousness in an original and striking manner to solve the practical and theoretical problems growing out of Kant's critical philosophy. In the field of ethics he was the most conspicuous exponent of German idealism. What Hegel had deduced from the Absolute by his application of the conception of development, Schleiermacher, following the critical method of Kant, sought to attain by an analysis of empirical consciousness. In its theoretical attitude toward being, consciousness is receptive and seeks to combine the data of sense into the highest possible conceptual unity; in its practical attitude consciousness is active and transfers the aim of reason from the world of sense to the world of conscious freedom. However, in both cases thought and being always remain separate for the finite understanding. On the other hand, that essential unity of reality which makes possible any relation of thought to being, such as volition to being, is present in religious feeling. While Hegel had employed a deductive, dialectical method to show that all being is in God, Schleiermacher reached this unity by an inductive process, which was guided by feeling, instead of by pure reason. Instead of starting with a timeless and spaceless Absolute, he started with the phenomenal world. His task was to analyze the reason that dominates the actual world of history, to bring to light its various purposes, combine them into a totality representing the absolute divine purpose of the universe, the *summum bonum*, and to show that the power to realize this ideal lies in religious consciousness. Schleiermacher's practical religious interests now took him into the field of theology.

Herbart. Herbart stuck even more closely to the Kantian view-point, but, like other followers of Kant, he sought to eliminate the conception of an unknowable reality, and press forward to the ultimate nature of things. He adopted Kant's analysis of consciousness, but in a psychological sense, and found that the transcendental reality consists of a plurality of simple substances. These he called "reals." They are psychical in nature and analogous to the monads of Leibniz. Through their relations to one another and to human consciousness the phenomenal world is brought into existence; and from their teleological cooperation Herbart deduces a divine, creative intelligence, analogous to the *monad-monadum* of Leibniz, thus opposing sharply current poetic naturalism and Spinozism. Herbart's practical and social philosophy, which is based on the judgments of the soul as to the relations of the "reals" to each other, particularly on judgments expressing like or dislike, also tends toward rationalism. On account of the method employed here, Herbart calls the result aesthetics, to which he subordinates ethics. In his view the ideal society would be one based on the insight and activity of the educated, and on the rational education of youth, and realizing in its organization the natural and fundamental ethical ideas. Herbart thus became not only a reformer of psychology, but of pedagogy as well.

Schopenhauer The last great representative of German Idealism in systematic philosophy was Schopenhauer. While with him the phenomenal world is idea (that is, existing only as a subject idea) its objective basis is not a "thing in itself" as Kant taught, but a universal will. This Schopenhauer interprets as a blind, illogical, aimless impulse, without any original ethical tendency whatsoever. Through the blind impulse of this world-will arises human intelligence and the phenomenal world. History loses all teleological significance and becomes an irrational and endless progression. Ethics, therefore, as the philosophy of the ultimate purpose of the world can only proclaim the aimlessness of the cosmic process and seek to put an end to it by stilling the will. This quietizing of the will is effected by recognizing the aimlessness of the process and resigning oneself to it completely. For these teachings, Schopenhauer found a support in Buddhism, which was then just becoming known in the West. He was bitter in his hatred of the theism of Judaism, which for him exhibited selfishness and sensuality, and was the root of all deceptive theism. The pure Christianity of Christ he regarded as a sort of mystical quietism. Though his metaphysical work, *De Welt als Wille und Vorstellung*, appeared as early as 1819, his teachings found no popular reception till after the wane of Hegel's influence in Germany.

Idealism in the Positive Sciences. The effects of this idealistic development are apparent in the positive sciences no less than in metaphysics. In accord with the idea of the oneness of the world, the natural sciences have been given a subordinate position, or else reduced to natural philosophy. The new spirit is manifested even more clearly in the historical sciences, where the genetic method is everywhere employed and individual facts are treated in relation to the whole development. For instance, the historian of literature or art now seeks to bring the facts with which he is dealing into relation with other phases of life and thus grasp the life and ideals of a nation as a whole. Similarly, the philologist is no longer satisfied with the study of one language, but seeks to correlate it with kindred tongues and reconstruct the inner life of the people. Even in the field of jurisprudence the genetic method has been adopted and particular stress laid on the development of common law. The effect of this idealistic movement may also be observed in theology. Here deistic efforts to base Christianity on a general theory of religion have been replaced by a more penetrating psychological analysis, together with a genetic view of religious history. It should be

added, though, that repeated and earnest attempts have been made to rescue the core of Christianity from the general flux of history and give to it a fixed character. Since it is in the universities, chiefly, that the sciences are cultivated, naturally the universities were reorganized in conformity to the changed ideals. It was in the University of Jena that German Idealism got its first foothold. From here the new educational ideal went to the newly established universities of Berlin, Heidelberg, Bonn, Breslau, and Munich, and into the secondary schools.

Western Philosophical Concepts of God

ANCIENT AND EARLY MEDIEVAL. Plato viewed as the highest of all things the good that was above all being and all knowledge, identified it with the divine nous, and attempted to raise the human spirit into the realm of ideas, into a likeness with the Godhead; which taught men to rise to the highest by a process of abstraction disregarding particulars and grasping at universals, and conceived the good of which it spoke not in a strictly ethical sense, but as, after all, the most utterly abstract and indefinable, entirely eluding all attempts at positive description. Neoplatonism went the furthest in this conception of the divine transcendence; God, the absolute One, was, according to Plotinus, elevated not only above all being, but also above all reason and rational activity. He did not, however, attempt to attain to this abstract highest good by reasoning or logical abstraction, but by an immediate contact between God and the soul in a state of ecstasy.

This tendency was shared by a school of thought within Judaism itself, whose influence upon Christian theology was considerable. The more Jewish speculation, as was the case especially at Alexandria, rose above an anthropomorphic idea of God to a spiritual conception, the more abstract the latter became. In this connection Platonism was the principal one of the Greek philosophical systems toward w c this Jewish theology maintained a receptive attitude. According to Philo, God is to on, " that which is " par excellence, and this being is rather the most universal of all than the supreme good with which Plato identified the divine; all that can be said is that God is, without defining the nature of his being. Between God and the world a middle place is attributed by Philo to the Logos (in the sense of ratio, not at all in the Johannine sense), as the principle of diversity and the summary of the ideas and powers operating the world.

When the Gnostics attempted to construct a great system of higher knowledge from a Christian standpoint, through assimilating various Greek and Oriental elements, and worked the facts of the Christian revelation into their fantastic speculation on general metaphysical and cosmic problems, this abstract Godhead became an obscure background for their system; according to the Valentinian doctrine, it was the primal beginning of all things, with eternal silence (sige) for a companion.

In the development of the Church's doctrine with Justin and the succeeding apologists, and still more with the Alexandrian school, the transcendental nature of God was emphasized, while the Scriptures and the 'religious conscience of Christendom still permitted the contemplation of him as a personal and loving Spirit. Theology did not at first proceed to a systematic and logical explanation of the idea of God with reference to these different aspects. Where philosophical and strictly scientific thought was active, as with the Alexandrians, the element of negation and abstraction got the upper hand. God is, especially with Origen, the simple Being with attributes, exalted above nous and ousia, and at the same time the Father, eternally begetting the Logos and touching the world through the Logos. In opposition to this developed a Judaistic and popular conception of God which leaned to the, anthropomorphic, and also a view like Tertuilian's' which,

under the influence of Stoic philosophy, felt obliged to connect with all realities, and thus also with God, the idea of a tangible substance. In this direction Dionysius the Areopagite finally proceeded to a really Neoplatonist theology, with an inexpressible God who is above all categories, both positive and negative, and thus is neither Being nor Not-being; who permits that which is to emanate from himself in a descending scale coming down to things perceived by the senses, but is unable to reveal his eternal truth in this emanation. With this doctrine is conconnected, after the Neoplatonist model, an inner union with God, an ecstatic elevation of the soul which resigns itself to the process into the obscure depth of the Godhead. The ethical conception of God and redemption thus gives place to a physical one, just as the emanation of all things from God was described as a physical process; and as soon as speculation attempts to descend from the hidden God to finite and personal life, this physical view connects itself with the abstract metaphysical.

In the West there was long a lack of scientific and speculative discussion of the idea of God. Augustine, the most significant name in Western theology, sets forth the conception of God as a self-conscious personal being which fitted in with his doctrine of the Trinity; but as his own development had led him through Platonism, the influence of that philosophy is found in the idea of God which he developed systematically and handed down. He conceives God as the unity of ideas, of abstract perfections, of the normal types of being, thinking, and acting; as simple essential in which will, knowledge, and being are one and the same. The fundamentally determinant factor in the conception of God by the Augustinian theology is thus pure being in general.

LATER MEDIEVAL. Scotus Erigena, who gave Dionysius the Areopagite to Western theology, though Augustine was not without influence upon him, fully accepted the notion of God as the absolute Inconceivable, above all affirmation and Erigena. all negation, distinguishing from him a world to which divine ideas and primal forms belong. He emphasizes the other side of this view-that true existence belongs to God alone, so that, in so far as anything exists in the universe, God is the essence of it; a practical pantheism, in spite of his attempting to enforce a creative activity on the part of God. The influence of this pantheistic view on medieval theology was a limited one; Amalric of Bena , with his proposition that God was all things, was its main disciple.

In accordance with its fundamental character, scholasticism attempted to reduce the idea of God into the categories which related to the laws of thought, to being, in general, and to the world. It began by adapting the Aristotelian terms to its own purposes. God, or absolute being, was to Aristotle the *primum mobile*, regarded thus from the standpoint of causation and not of mere being, and also a thinking subject. The ideas and prototypes of the finite are accordingly to be found in God, who is the final Cause. God, in Albertus Magnus and Thomas Aquinas, is not the essential being of things, but he is their *esse effective et exemplariter*, their *primum movens*, and their *causa finalis*. Aristotelian, again, is the definition of God's own nature, that be is, as a thinking subject, *actus purus*, pure, absolute energy, without the distinction found in finite beings between potentiality and actuality. In opposition to Thomas, Duns Scotus emphasized in his conception of God the *primum ens* and *primum movens*, the element of will and free causation. The arbitrary nature of the will of God, taught by him, was raised by Ockham to the most important element of his teaching about God. Upon this abstract conception of the will of God as arbitrary and unconditioned depend the questions (so characteristic of scholasticism from Abelard down) as to whether all things are possible to God.

About the end of the thirteenth century, by the side of the logical reasonings of scholasticism, there arose the mystical theology of Eckhart, which attempted to bring the Absolute near to the hearts of men as the object of an immediate intuition dependent upon complete self-surrender. The

Neoplatonic conception of the Absolute is here pushed to its extreme, and Dionysius has more influence than Thomas Aquinas. The view of God's relation to the world is almost pantheistic, unless it may be rather called acosmistic, regarding the finite as naught. This is Eckhart's teaching, although at the same time he speaks of a creation of the world and of a Son in whom God expresses himself and creates. This God is regarded as goodness and love, communicating himself in a way, but not to separate and independent images of his own being; rather, he possesses and loves himself in all things, and the surrender to him is passivity and self-annihilation. The ruling ideas of this view were moderated by the practical German mystics and found in this form a wide currency. On the other hand, pantheistic heretics, such as the Brethren of the Free Spirit combined antinomian principles with the doctrine that God was all things and that the Christian united with God was perfect as God.

MODERN GERMAN PHILOSOPHERS. The independent metaphysical systems of the philosophers, which embraced God and the world, did not at first make any profound impression on the thought of theologians. Spinoza's pantheism was by its very nature excluded from consideration; but the philosophy of Leibniz and Wolff, with its conception of God as a supremely perfect, personal Being, in whom all possible realities were embraced in their highest form, and with its demonstration of God's existence, offered itself as a friend to Christian doctrine, and was widely influential. In so far, however, as the theologians adopted any of its conclusions, it was with little clearness of insight or independent thought as to the relation of these metaphysical concepts to the Christian faith or as to their own validity.

A new epoch in German philosophy, with which theology had and still has to reckon, came in with Kant. Confidence in the arguments by which God's existence had been proved and defined was at least shaken by his criticism, which, however, energetically asserted the firm foundation of moral consciousness, and so led up to God by a new way, in postulating the existence of a deity for the establishment of the harmony required by the moral consciousness between the moral dignity of the subjects and their happiness based upon the adaptation of nature to their ends. Fichte was led from this standpoint to a God who is not personal, but represents the moral order of the universe, believing in which we are to act as duty requires, without question as to the results.

But for a time the most successful and apparently the most dangerous to Christian theology was a pantheistic philosophical conception of God which took for its foundation the idea of an Absolute raised above subject and object, above thinking and being; which explained and claimed to deduce all truth as the necessary self -development of this idea. With Schelling this pantheism is still in embryo, and finally comes back (in his "philosophy of revelation ") to the recognition of the divine personality, with an attempt to construct it speculatively. In a great piece of constructive work the philosophy of Hegel undertook to show how this Absolute is first pure being, identical with not-being; how then, in the form of externalization or becoming other, it comes to be nature or descends to nature; and finally, in the finite spirit, resumes itself into itself, comes to itself, becomes self-conscious, and thus now for the first time takes on the form of personality. For Christian theology the special importance of this teaching, was its claim to have taken what Christian doctrine had comprehended only in a limited way of God, the divine Personality, the Incarnation, etc., and to have expressed it according to its real content and to the laws of thought.

The conservative Hegelians still maintained that God, in himself and apart from the creation of the world and the origin of human personality, was to be considered as a self-conscious spirit or personality, and thus offered positive support to the Christian doctrine of God and his revelation of himself. But the Hegelian principles were more logically carried out by the opposite wing of the

party, especially by David Friedrich Strauss (in his Christliche Glaubenslehre, Tubingen, 1840) in the strongest antithesis to the Christian doctrine of a personal God, of Christ as the only Son of God and the God-Man, and of a personal ethical relation between God and man. Some other philosophers, however, who may be classed in general under the head of the modern speculative idealism, have, in their speculations on the Absolute as actually present in the universe, retained a belief in the personality of God.

The realist philosopher Herbart, who recognized a personal God not through speculations on the Absolute and the finite, but on the basis of moral consciousness and teleology, yet defined little about him, and what he has to say on this subject never attracted much attention among theologians. The Hegelian pantheistic " absolute idealism," once widely prevalent, did not long retain its domination. Its place was taken first in many, quarters, as with Strauss, by an atheistic materialism; Hegel had made the universal abstract into God, and when men abandoned their belief in this and in its power to produce results, they gave up their belief in God with it. Among the post-Hegelian philosophers the most important for the present subject is Lotze, with his defense and confirmation of the idea of a personal God, going back in the most independent way both to Herbart and to idealism, both to Spinoza and Leibniz. Christian theology can, of course, only protest against the peculiar pantheism of Schopenhauer, which is really much older than he, but never before attained wide currency, and against that of Von Hartmann. The significance for the doctrine of God of the newer philosophical undertakings which are characterized by an empiricist-realist tendency, and based on epistemology and criticism is found not so much in their definite expressions about God-they do not as a rule consider him an object of scientific expression, even when they allow him to be a necessary object of faith-as in the impulse which they give to critical investigation of religious belief and perception in general.

Theology, at least German theology, before Schleiermacher showed but little understanding of and interest in the problems regarding a proper conception and confirmation of the doctrine of God which had been laid before it in this development of philosophy beginning with Kant. This is especially true of its attitude toward Kant himself and not only of the supranaturalists who were suspicious of any exaltation of the natural reason, but also of the rationalists, who still had a superficial devotion to the Enlightenment and to Wolffian philosophy. In Schleiermacher's teaching about God, however, the results of a devout and immediate consciousness were combined with philosophical postulates. In his mind the place of all the so-called proofs of the existence of God is completely supplied by the recognition that the feeling of absolute dependence involved in the devout Christian consciousness is a universal element of life; in this consciousness he finds the explanation of the source of this feeling of dependence, i.e., of God, as being love, by which the divine nature communicates itself. For his reasoned philosophical speculation, however, on the human spirit and universal being, the idea of God is nothing but the idea of the absolute unity of the ideal and the real, which in the world exist as opposites. (Compare Schelling's philosophy of identity, unlike which, however, Schleiermacher acknowledges the impossibility of a speculative deduction of opposites from an original identity; and the teaching of Spinoza, whose conception of God, however, as the one substance he does not share.) Thus God and the universe are to him correlatives, but not identical-God is unity without plurality, the universe plurality without unity; and this God is apprehended by man's feeling, just as man's feeling apprehends the unity of ideal and real.

MODERN BRITISH AND AMERICAN PHILOSOPHERS. In Great Britain and America the idea of God has undergone many vicissitudes. In the period of Deism , 1650-1800, the doctrine of God

was profoundly affected by certain modern questions which were already emerging: the scientific view of nature as a unity, the denial of the principle of external authority, the right and sufficiency of reason, and the ethical as compared with the religious value of life. The deists yielded to none of their contemporaries in affirming that God was personal, the cause of the fixed providential order of the world, and of the moral order with its rewards and punishments both here and hereafter. The cosmological was the only theistic argument. God's wisdom and power were expressed neither in supernatural revelation nor in miracle. His nature was perfectly apprehensible to man's reason. He was, however, absolutely transcendent, i.e., not merely distinct from but removed from the world, an absentee God. This process of thought reached its negative skeptical result in David Hume; the being of God could be proved neither by rational considerations nor by the prevailing sensationalist theory of knowledge. Outside of the deists, the demonstration of the being and attributes of God by Samuel Clarke was thoroughly representative of the time. Something must have existed from eternity, of an independent, unchangeable nature, self-existent, absolutely inconceivable by us, necessarily everlasting, infinite, omnipotent, one and unique, intelligent and free, infinitely powerful, wise, good, and just, possessing the moral attributes required for governing the world. Bishop Butler (Analogy of Religion) held as firmly as the deists the transcendence of God, and if he made less of the cosmic, ethical, and mysterious than of the redemptive side of the divine nature, this is to be referred not to his underestimate of the redemptive purpose of God, but to the immediate aim of his apologetic. Accepting the fundamental tenet of Matthew Tindal , i.e., the identity of natural and revealed religion, he shows that the mysteries of revealed religion are not more inexplicable than the facts of universal human experience. Thus he seeks to open a door for God's activity in revelation-prophecy, miracles, and redemption A new tendency in the idea of God appears in William Paley. The proof of the existence and attributes of the deity is teleological. Nature is a contrivance of which God is the immediate creator. The celebrated Bridgewater Treatises follow in the same path, proving the wisdom, power, and goodness of God from geology, chemistry, astronomy, the animal world, the human body, and the inner world of consciousness. Chalmers sharply distinguishes between natural and revealed theology, as offering two sources for the knowledge of God. In this entire great movement of thought, therefore, God is conceived as transcendent. God and the world are presented in a thoroughly dualistic fashion. God is the immediate and instantaneous creator of the world as a mechanism. The principal divine attributes are wisdom and power; goodness is affirmed, but appears to be secondary: its hour has not yet come.

In America during the same period Jonathan Edwards is the chief representative of the idea of God. His doctrine centers in that of absolute sovereignty. God is a personal being, glorious, transcendent. The world has in him its absolute source, and proceeds from him as an emanation, or by continuous creation, or by perpetual energizing thought. As motive for the creation, he added to the common view-the declarative glory of God-that of the happiness of the creature. On the basis of causative predestination he maintains divine foreknowledge of human choice-a theory pushed to extreme limits by later writers, Samuel Hopkins and Nathanael Emmons. His doctrine of the divine transcendence was qualified by a thorough-going mysticism, a Christian experience characterized by a profound consciousness of the immediate presence, goodness, and glory of God. His conception of the ethical nature of God contained an antinomy -which he never resolved; the Being who showed surpassing grace to the elect and bestowed unnumbered common favors on the nonelect in this life, would, the instant after death, withdraw from the latter every vestige of good and henceforth pour out upon them the infinite and eternal fury of his wrath. Edwards' doctrine of

God and its implications later underwent, however, serious modifications. In the circle which recognized him as leader, his son reports that no less than ten improvements had been made, some of which, e.g. concerning the atonement, directly affected the idea of God. Predestination was affirmed, but, instead of proceeding from an inscrutable will, following Leibniz, rested on divine foreknowledge of all possible worlds and included the purpose to realize this, the best of all possible worlds (A. A. Hodge, *Outlines of Theology*, New York, 1900; S. Harris, *God, the Creator and Lord of All*, ib., 1896). The atonement was conceived as sufficient but 'not efficient for all (C. Hodge, *Systematic Theology*, Philadelphia, 1865), or, on the other hand, as expressing the sincere purpose of God to redeem all sinners (A. E. Park, The Atonement; Introductory Essay, Boston, 1859). Divine sovereignty was roundly affirmed; for some it contained the secret of a double decree, for others it offered a convincing basis for the larger hope.

NINETEENTH-CENTURY DEVELOPMENTS. During the nineteenth century a new movement appeared in English thought. Sir William Hamilton held that God was the absolute, the unconditioned, the cause of all (Philosophy of the Unconditioned, in Edinburgh Review, Oct. 1829). But since all thinking is to condition, and to condition the unconditioned is self-contradictory, God is both unknown and unknowable. Following in the same path H. L. Alansel (Limits of Religious Thought, London, 1867) found here the secret by which to maintain the mysteries of the faith of the church in the Trinity, the incarnation, the atonement, and other beliefs. Revelation was therefore required to supplement men's ignorance and to communicate what-human intelligence was unable to discover. Hence the dogmas concerning God which had been found repugnant or opaque to reason were philosophically reinstated and became once more authoritative for faith. In his System of Synthetic Philosophy Herbert Spencer (First Principles, London, 1860-62) maintains on the one hand an ultimate reality which is the postulate of theism, the absolute datum of consciousness, and on the other hand by reason of the limitations of knowledge a total human incapacity to assign any attributes to this utterly inscrutable power. In accordance with his doctrine of evolution he holds that this ultimate reality is an infinite and eternal energy from which all things proceed, the same which wells up in the human consciousness. He is neither materialistic nor atheistic. This reality is not personal according to the human type, but may be super-personal. Religion is the feeling of awe in relation to this inscrutable and mysterious power. With an aim not unlike that of Herbert Spencer, Matthew Arnold sought to reconcile the conflicting claims of religion, agnosticism, evolution, and history, by substituting for the traditional personal God the " Power not ourselves that makes for righteousness." Side by side with this movement appeared another led by Samuel Taylor Coleridge, based upon a spiritual philosophy, which found in the moral nature a revelation of God (*Aids to Reflexion*, London, 1825). This has borne fruit in many directions: in the great poets, Wordsworth, Tennyson, Browning; in preachers like Cardinal Newman, Dean Stanley, John Tulloch, Frederick William Robertson, and Charles Kingsley; in philosophical writers, as John Frederic Denison Maurice and James Martineau. The idea of God is taken out of dogma and the category of the schools and set in relation to life, the quickening source of ideals and of all individual and social advance. Religious thought in America has fully shared in these later tendencies in Great Britain, as may be seen by reference to John Fiske, *Idea of God* (Boston, 1886), unfolding the implications of Spencer's thought, and, reflecting the spirit of Coleridge, William Ellery Channing, *Works* (6 vols., Boston, 1848), W. G. T. Stead, " Introductory Essay " to Coleridge's *Works* (New York, 1884), and Horace Bushnell, Nature and the Supernatural, and Sermons (in Centenary edition of his Works, New York, 1903). An idea of God based on idealism, represented in Great Britain by John Caird, Philosophy of Religion (London,

1881), Edward Caird, *The Evolution of Religion* (ib. 1893), in Canada by John Watson, *God's Message to the Human Soul* (New York, 1907), has received impressive statement by Josiah Royce, *The Conception of God* (ib., 1897), and *The World and the Individual* (2 vols., 1899-1901). God is a being who possesses all logical possible knowledge, insight, wisdom. This includes omnipotence, self-consciousness, self-possession, goodness, perfection, peace. Thus this being possesses absolute thought and absolute experience, both completely organized. The absolute experience is related to human experience as an organic whole to its integral fragments. This idea of God which centers in omniscience does not intend to obscure either the ethical qualities or the proper personality of the absolute.

Gorgias (483-378)

Life. **A Greek sophist and rhetorician, known as "the Nihilist," a native of Leontini in Sicily. In BCE. 427, when already advanced in years, he came to Athens on an embassy from his native city, to implore aid against the Syracusans. The finished style of his speaking excited general admiration. He was successful in the object of his mission, and immediately returned home; but he soon came back to Athens, which he made his headquarters, traveling through Greece, like the other sophists, and winning much popularity and profit from a large number of disciples. He declined to assume the name of sophist, preferring that of rhetorician. He professed not to teach virtue, but the art of persuasion; in other words, to give his disciples such absolute readiness in speaking, that they should be able to convince their hearers independently of any knowledge of the subject. He did not found his instruction on any definite rhetorical system, but gave his pupils standard passages of literature to learn by heart and imitate, practicing them in the application of rhetorical figures. He appeared in person, on various occasions, at Delphi, Olympia, and Athens, with model speeches which he afterwards published. It must be remembered that it was Gorgias who transplanted rhetoric to Greece, and who helped to diffuse the Attic dialect as the literary language of prose. There remain two works ascribed to him, but not genuine -- the so-called *Apology of Palamedes*, and the *Encomium on Helen*. He survived Socrates, who died in 399, and ended his days at Larissa in Thessaly in his hundred and fifth year.**

Philosophy. **Gorgias's nihilistic philosophy was expressed in his work, *On Nature, or the Non-existent*, the title of which suggests the sophistical love of paradox. The text survives only in summary form in Sextus Empiricus, and Aristotle's *On Melissus, Xeonphanes, and Gorgias*. His position is summed up in three propositions: (a) Nothing exists; (b) If anything existed, it could not be known; (c) If anything did exit, and could be known, it could not be communicated. For proof of the first proposition, "nothing exists," Gorgias attached himself to the school of the Eleatics, especially to Zeno. Zeno taught that in all multiplicity and motion, that is to say, in all existence, there are irreconcilable contradictions. Zeno was in no sense a sceptic, though. He did not seek for contradictions in things for the sake of contradictions, but in order to support the positive thesis of Parmenides, that only being exists, and that becoming is not at all. Zeno, therefore, is to be regarded as a constructive, and not merely a destructive, thinker. But it is obvious that by emphasizing only the negative element in Zeno's philosophy, it is possible to use his antinomies as powerful weapons in the cause of skepticism and nihilism. And it was in this way that Gorgias made use of the dialectic of Zeno. Since all existence is self-contradictory, it follows hat nothing exists. He also made use of the famous argument of Parmenides regarding the origin of being. If anything is, said Gorgias, it must have had a beginning. Its being must have arisen either from being, or from not-being. If it arose from being, there is no beginning. If it arose from not-being, this is impossible, since something cannot arise out of nothing. Therefore nothing exists.**

The second proposition of Gorgias, that if anything exists it cannot be known, is part and parcel of the whole Sophistic tendency of thought, which identifies knowledge with sense-perception, and ignores the rational element. Since sense-impressions differ in different people, and even in the same person, the object as it is in itself cannot be known. The third proposition follows from the same identification of knowledge with sensation, since sensation is what cannot be communicated.

Greek Philosophy

Presocratics. **Our western philosophical tradition began in ancient Greece in the 6th century BCE. The first philosophers are called "Presocratics" which designates that they came before Socrates. The Presocratics were from eithe r the eastern or western regions of the Greek world. Athens -- home of Socrates, Plato and Aristotle -- is in the central Greek region and was late in joining the philosophical game. The Presocratic's most distinguishing feature is emphasis on questions o f physics; indeed, Aristotle refers to them as "Investigators of Nature". Their scientific interests included mathematics, astronomy, biology. As the first philosophers, though, they emphasized the rational unity of things, and rejected mythological expla nations of the world. Only fragments of the original writings of the presocratics survive, in some cases merely a single sentence. The knowledge we have of them derives from accounts of early philosophers, such as Aristotle's *Physics* and *Metaphy sics, The Opinions of the Physicists* by Aristotle's pupil Theophratus, and Simplicius an Neoplatonist who compiled existing quotes.**

The first group of Presocratic philosophers were from Ionia. Its people were naturally inclined to a physical or sensualist view, and the Ionian philosophers sought the material principle (*arche*) of things, and the mode of their origin and disappearance. Thales of Miletus (about BCE. 640) is reputed the father of Greek philosophy. He declared water to be the basis of all things. Next came Anaximander of Miletus (about B. C. 611-547), the first writer on philosophy. He assumed as the first principle an undefined substance (*to apeiron*) without qualities, out of which the primary opposites, hot and cold, moist and dry, became differentiated. His countryman and younger contemporary, Anaximenes, took for his principle air, conceiving it as modified, by thickening and thinning, into fire, wind, clouds, water, and earth. Heraclitus of Ephesus (about BCE. 535-475) assumed as the principle of substance aetherial fire (*logos*). From fire all things originate, and return to it again by a never-resting process of development. All things, therefore, are in a perpetual flux (*panta rei*).

Philosophy was first brought into connection with practical life by Pythagoras of Samos (about 582-504), from whom it received its name: "the love of wisdom". Regarding the world as perfect harmony, dependent on number, he aimed at inducing humankind likewise to lead a harmonious life. His doctrine was adopted and extended by a large following of Pythagoreans, including Damon, especially in Lower Italy.

That country was also the home of Eleatic doctrine of the One, called after the town of Elea, the headquarters of the school. It was founded by Xenophanes of Colophon (born about 570), the father of pantheism, who declared God to be the eternal unity, permeating the universe, and governing it by his thought. His great disciple, Parmenides of Elea (born about 511), affirmed the one unchanging existence to be alone true and capable of being conceived, and multitude and

change to be an appearance without reality. This doctrine was defended by his younger countryman Zeno in a polemic against the common opinion, which sees in things multitude, becoming, and change. Empedocles of Agrigentum (born 492) appears to have been partly in agreement with the Eleatic School, partly in opposition to it. On the one hand, he maintained the unchangeable nature of substance; on the other, he supposes a plurality of such substances -- i. e. the four elements, earth, water, air, and fire. Of these the world is built up, by the agency of two ideal principles as motive forces -- viz., love as the cause of union, strife as the cause of separation.

Anaxagoras of Clazomenae (born about BCE. 500) also maintained the existence of an ordering principle as well as a material substance, and while regarding the latter as an infinite multitude of imperishable primary elements, qualitatively distinguished, he conceived divine reason or Mind (*nous*) as ordering them. He referred all generation and disappearance to mixture and resolution respectively. To him belongs the credit of first establishing philosophy at Athens, in which city it reached its highest development, and continued to have its home for one thousand years without intermission. The first explicitly materialistic system was formed by Leucippus (fifth century BCE.) and his pupil Democritus of Abdera (born about BCE. 460). This was the doctrine of atoms -- small primary bodies infinite in number, indivisible and imperishable, qualitatively similar, but distinguished by their shapes. Falling eternally through the infinite void, they collide and unite, thus generating existence, and forming objects which differ in accordance with the varieties, in number, size, shape, and arrangement, of the atoms which compose them.

The efforts of all these earlier philosophers had been directed somewhat exclusively to the investigation of the ultimate basis and essential nature of the external world. Hence their conceptions of human knowledge, arising out of their theories as to the constitution of things, had been no less various. The Eleatics, for example, had been compelled to deny the existence of any objective truth, since to the world of sense, with its multitude and change, they allowed only a phenomenal existence. This inconsistency led to the position taken up by the class of persons known as Sophists that all thought rests solely on the apprehensions of these senses and on subjective impression, and that therefore we have no other standards of action than convention for the individual. Specializing in rhetoric, the Sophists were more professional educators than philosophers. They flourished as a result of a special need for at that time for Greek education. Prominent Sophists include Protagoras, Gorgias, Hippias, and Prodicus.

Socrates and his Followers.

A new period of philosophy opens with the Athenian Socrates (469-399). Like the Sophists, he rejected entirely the physical speculations in which his predecessors had indulged, and made the subjective thoughts and opinions of men his starting-point; but whereas it was the thoughts of and opinions of the individual that the Sophists took for the standard, Socrates tried to extract from the common intelligence of humankind an objective rule of practical life. For this purpose he employed the two forms of philosophical inquiry of which he is the inventor, induction and definition. Such a standard he saw in knowledge, by which term he understood the cognition in thought of the true concept of an object, and identified it with virtue; that is to say, such action as proceeds from clear cognition of the concept appropriate to the circumstances. Thus, although Socrates did not himself succeed in establishing a genuine ethical principle, he is nevertheless the founder of ethics, as he is also of dialectic, the method of the highest speculative thought.

Of Socrates' numerous disciples many either added nothing to his doctrine, or developed it in a

one-sided manner, by confining themselves exclusively wither to dialectic or to ethics. Thus the Athenian Xenophon contented himself, in a series of writings, with exhibiting the portrait of his master to the best of his comprehension, and added nothing original. The Megarian School, founded by Euclides of Megara, devoted themselves almost entirely to dialectic investigation of the one Good. Stilpo of Megara became the most distinguished member of the school. Ethics predominated both with the Cynics and Cyrenaics, although their positions were in direct opposition. Antisthenes of Athens, the founder of the Cynics, conceived the highest good to be the virtue which spurns every enjoyment. Cynicism continued in Greece with Menippus and on to Roman times through the efforts of Demonax and others. Aristippus of Cyrene, the founder of the Cyrenaics, considered pleasure to be the sole end in life, and regarded virtue as a good only in so far as it contributed to pleasure.

Plato. **Both aspects of the genius of Socrates were first united in Plato of Athens (428-348), who also combined with them all the principles established by earlier philosophers, in so far as they had been legitimate, and developed the whole of this material into the unity of a comprehensive system. The groundwork of Plato's scheme, though nowhere expressly stated by him, is the threefold division of philosophy into dialectic, ethics, and physics; its central point is the theory of forms. This theory is a combination of the Eleatic doctrine of the One with Heraclitus's theory of a perpetual flux and with the Socratic method of concepts. The multitude of objects of sense, being involved in perpetual change, are thereby deprived of all genuine existence. The only true being in them is founded upon the forms, the eternal, unchangeable (independent of all that is accidental, and therefore perfect) types, of which the particular objects of sense are imperfect copies. The quantity of the forms is defined by the number of universal concepts which can be derived from the particular objects of sense.**

The highest form is that of the Good, which is the ultimate basis of the rest, and the first cause of being and knowledge. Apprehensions derived from the impression of sense can never give us the knowledge of true being -- i.e. of the forms. It can only be obtained by the soul's activity within itself, apart from the troubles and disturbances of sense; that is to say, by the exercise of reason. Dialectic, as the instrument in this process, leading us to knowledge of the ideas, and finally of the highest idea of the Good, is the first of sciences (*scientia scientiarum*). In physics, Plato adhered (though not without original modifications) to the views of the Pythagoreans, making Nature a harmonic unity in multiplicity. His ethics are founded throughout on the Socratic; with him, too, virtue is knowledge, the cognition of the supreme form of the Good. And since in this cognition the three parts of the soul -- cognitive, spirited, and appetitive -- all have their share, we get the three virtues: Wisdom, Courage, and Temperance or Continence. The bond which unites the other virtues is the virtue of Justice, by which each several part of the soul is confined to the performance of its proper function.

The school founded by Plato, called the Academy (from the name of the grove of the Attic hero Academus where he used to deliver his lectures) continued for long after. In regard to the main tendencies of its members, it was divided into the three periods of the Old, Middle, and New Academy. The chief personages in the first of these were Speusippus (son of Plato's sister), who succeeded him as the head of the school (till 339), and Xenocrates of Chalcedon (till 314). Both of them sought to fuse Pythagorean speculations on number with Plato's theory of ideas. The two other Academies were still further removed from the specific doctrines of Plato, and advocated

skepticism.

Aristotle. The most important among Plato's disciples is Aristotle of Stagira (384-322), who shares with his master the title of the greatest philosopher of antiquity. But whereas Plato had sought to elucidate and explain things from the supra-sensual standpoint of the forms, his pupil preferred to start from the facts given us by experience. Philosophy to him meant science, and its aim was the recognition of the purpose in all things. Hence he establishes the ultimate grounds of things inductively -- that is to say, by *a posteriori* conclusions from a number of facts to a universal. In the series of works collected under the name of *Organon*, Aristotle sets forth, almost in a final form, the laws by which the human understanding effects conclusions from the particular to the knowledge of the universal.

Like Plato, he recognizes the true being of things in their concepts, but denies any separate existence of the concept apart from the particular objects of sense. They are inseparable as matter and form. In matter and form, Aristotle sees the fundamental principles of being. Matter is the basis of all that exists; it comprises the potentiality of everything, but of itself is not actually anything. A determinate thing only comes into being when the potentiality in matter is converted into actuality. This is effected by form, inherent in the unified object and the completion of the potentiality latent in the matter. Although it has no existence apart form the particulars, yet, in rank and estimation, form stands first; it is of its own nature the most knowable, the only true object of knowledge. For matter without any form cannot exist, but the essential definitions of a common form, in which are included the particular objects may be separated from matter. Form and matter are relative terms, and the lower form constitutes the matter of a higher (e.g. body, soul, reason). This series culminates in pure, immaterial form, the Deity, the origin of all motion, and therefore of the generation of actual form out of potential matter.

All motion takes place in space and time; for space is the potentiality, time the measure of the motion. Living beings are those which have in them a moving principle, or soul. In plants the function of soul is nutrition (including reproduction); in animals, nutrition and sensation; in men, nutrition, sensation, and intellectual activity. The perfect form of the human soul is reason separated from all connection with the body, hence fulfilling its activity without the help of any corporeal organ, and so imperishable. By reason the apprehensions, which are formed in the soul by external sense-impressions, and may be true or false, are converted into knowledge. For reason alone can attain to truth either in cognition or action. Impulse towards the good is a part of human nature, and on this is founded virtue; for Aristotle does not, with Plato, regard virtue as knowledge pure and simple, but as founded on nature, habit, and reason. Of the particular virtues (of which there are as many as there are contingencies in life), each is the apprehension, by means of reason, of the proper mean between two extremes which are not virtues -- e.g. courage is the mean between cowardice and foolhardiness. The end of human activity, or the highest good, is happiness, or perfect and reasonable activity in a perfect life. To this, however, external goods are more of less necessary conditions.

The followers of Aristotle, known as Peripatetics (Theophrastus of Lesbos, Eudemus of Rhodes, Strato of Lampsacus, etc.), to a great extent abandoned metaphysical speculation, some in favor of natural science, others of a more popular treatment of ethics, introducing many changes into the Aristotelian doctrine in a naturalistic direction. A return to the views of the founder first appears among the later Peripatetics, who did good service as expositors of Aristotle's works. Peripatetic

School tended to make philosophy the exclusive property of the learned class, thereby depriving it of its power to benefit a wider circle. This soon produced a negative reaction, and philosophers returned to the practical standpoint of Socratic ethics. The speculations of the learned were only admitted in philosophy where immediately serviceable for ethics. The chief consideration was how to popularize doctrines, and to provide the individual, in a time of general confusion and dissolution, with a fixed moral basis for practical life.

Stoicism. Such were the aims of Stoicism, founded by Athens about 310 by Zeno of Citium (in Cyprus), and brought to fuller systematic form by his successors a heads of the school, Cleanthes of Assos, and especially Chrysippus of Soli, who died about 206. Important Stoic writers of the Roman period include Epictetus and Marcus Aurelius. Their doctrines contained little that was new, seeking rather to give a practical application to the dogmas which they took ready-made from previous systems. With them philosophy is the science of the principles on which the moral life ought to be founded. The only allowable effort is towards the attainment of knowledge of human and divine things, in order to thereby regulate life. The method to lead men to true knowledge is provided by logic; physics embraces the doctrines as to the nature and organization of the universe; ethics draws from them its conclusions for practical life. Regarding Stoic logic, all knowledge originates in the real impressions of things on the senses, which the soul, being at birth a blank slate, receives in the form of presentations. These presentations, when confirmed by repeated experience, are syllogistically developed by the understanding into concepts. The test of their truth is the convincing or persuasive force with which they impress themselves upon the soul.

In physics the foundation of the Stoic doctrine was the dogma that all true being is corporeal. Within the corporeal they recognized two principles, matter and force -- that is, the material, and the Deity (*logos*, order, fate) permeating and informing it. Ultimately, however, the two are identical. There is nothing in the world with any independent existence: all is bound together by an unalterable chain of causation. The agreement of human action with the law of nature, of the human will with the divine will, or life according to nature, is Virtue, the chief good and highest end in life. It is essentially one, the particular or cardinal virtues of Plato being only different aspects of it; it is completely sufficient for happiness, and incapable of any differences of degree. All good actions are absolutely equal in merit, and so are all bad actions. All that lies between virtue and vice is neither good nor bad; at most, it is distinguished as preferable, undesirable, or absolutely indifferent. Virtue is fully possessed only by the wise man, who is no way inferior in worth to Zeus; he is lord over his own life, and may end it by his own free choice. In general, the prominent characteristic of Stoic philosophy is moral heroism, often verging on asceticism.

Epicureanism. The same goal which was aimed at in Stoicism was also approached, from a diametrically opposite position, in the system founded about the same time by Epicurus, of the deme Gargettus in Attica (342-268), who brought it to completion himself. Epicureanism, like Stoicism, is connected with previous systems. Like Stoicism, it is also practical in its ends, proposing to find in reason and knowledge the secret of a happy life, and admitting abstruse learning only where it serves the ends of practical wisdom. Hence, logic (called by Epicurus (*kanonikon*), or the doctrine of canons of truth) is made entirely subservient to physics, physics to ethics. The standards of knowledge and canons of truth in theoretical matters are the impressions of the senses, which are true and indisputable, together with the presentations formed from such

impressions, and opinions extending beyond those impressions, in so far as they are supported or not contradicted by the evidence of the senses. In practical questions the feelings of pleasure and pain are the tests. Epicurus's physics, in which he follows in essentials the materialistic system of Democritus, are intended to refer all phenomena to a natural cause, in order that a knowledge of nature may set men free from the bondage of disquieting superstitions.

In ethics he followed within certain limits the Cyrenaic doctrine, conceiving the highest good to be happiness, and happiness to be found in pleasure, to which the natural impulses of every being are directed. But the aim is not with him, as it is with the Cyrenaics, the pleasure of the moment, but the enduring condition of pleasure, which, in its essence, is freedom from the greatest of evils, pain. Pleasures and pains are, however, distinguished not merely in degree, but in kind. The renunciation of a pleasure or endurance of a pain is often a means to a greater pleasure; and since pleasures of sense are subordinate to the pleasures of the soul, the undisturbed peace of the soul is a higher good than the freedom of the body from pain. Virtue is desirable not for itself, but for the sake of pleasure of soul, which it secures by freeing men from trouble and fear and moderating their passions and appetites. The cardinal virtue is wisdom, which is shown by true insight in calculation the consequences of our actions as regards pleasure or pain.

Skepticism. The practical tendency of Stoicism and Epicureanism, seen in the search for happiness, is also apparent in the Skeptical School founded by Pyrrho of Elis (about 365-275). Pyrrho disputes the possibility of attaining truth by sensory apprehension, reason, or the two combined, and thence infers the necessity of total suspension of judgment on things. Thus can we attain release from all bondage to theories, a condition which is followed, like a shadow, by that imperturbable state of mind which is the foundation of true happiness. Pyrrho's immediate disciple was Timon. Pyrrho's doctrine was adopted by the Middle and New Academies (see above), represented by Arcesilaus of Pitane (316-241) and Carneades of Cyrene (214-129) respectively. Both attacked the Stoics for asserting a criterion of truth in our knowledge; although their views were indeed skeptical, they seem to have considered that what they were maintaining was a genuine tenet of Socrates and Plato.

The latest Academics, such as Antiochus of Ascalon (about 80 BCE.), fused with Platonism certain Peripatetic and many Stoic dogmas, thus making way for Eclecticism, to which all later antiquity tended after Greek philosophy had spread itself over the Roman world. Roman philosophy, thus, becomes an extension of the Greek tradition. After the Christian era Pythagoreanism, in a resuscitated form, again takes its place among the more important systems. Pyrrhonian skepticism was also re-introduced by Aenesidemus, and developed further by Sextus Empiricus. But the preeminence of this period belongs to Platonism, which is notably represented in the works of Plutarch of Chaeronea and the physician Galen.

Neoplatonism. The closing period of Greek philosophy is marked in the third century CE. by the establishment of Neoplatonism in Rome. Its founder was Plotinus of Lycopolis in Egypt (205-270) and its emphasis is a scientific philosophy of religion, in which the doctrine of Plato is fused with the most important elements in the Aristotelian and Stoic systems and with Eastern speculations. At the summit of existences stands the One or the Good, as the source of all things. It emanates from itself, as if from the reflection of its own being, reason, wherein is contained the infinite store of ideas. Soul, the copy of the reason, is emanated by and contained in it, as reason is

in the One, and, by informing matter in itself non-existence, constitutes bodies whose existence is contained in soul. Nature, therefore, is a whole, endowed with life and soul. Soul, being chained to matter, longs to escape from the bondage of the body and return to its original source. In virtue and philosophic thought soul had the power to elevate itself above the reason into a state of ecstasy, where it can behold, or ascend up to, that one good primary Being whom reason cannot know. To attain this union with the Good, or God, is the true function of humans, to whom the external world should be absolutely indifferent.

Plotinus's most important disciple, the Syrian Porphyrius, contented himself with popularizing his master's doctrine. But the school if Iamblichus, a disciple of Porphyrius, effected a change in the position of Neoplatonism, which now took up the cause of polytheism against Christianity, and adopted for this purpose every conceivable form of superstition, especially those of the East. Foiled in the attempt to resuscitate the old beliefs, its supporters then turned with fresh ardor to scientific work, and especially to the study of Plato and Aristotle, in the interpretation of whose works they rendered great services. The last home of philosophy was at Athens, where Proclus (411-485) sought to reduce to a kind of system the whole mass of philosophic tradition, until in 529 CE, the teaching of philosophy at Athens was forbidden by Justinian.

William Hamilton (1788-1856)

LIFE AND WRITINGS. Scottish philosopher, born at Glasgow March 8, 1788, died. at Edinburgh May 6, 1856. He studied first in Glasgow University, where his father had been professor of anatomy and botany; took a course in medicine at the University of Edinburgh in 1806-07; and in May, 1807, entered Balliol College, Oxford (B.A., 1811; M.A., 1814), where he concentrated upon classics and philosophy and gained the reputation of being the most learned Aristotelian in the university. In 1813 he settled in Edinburgh as an advocate, though he never secured a large practice. In 1820 he established his claim to the baronetcy of Preston, and was thenceforth known as Sir William. In the same year he defeated for the chair of moral philosophy at the University of Edinburgh by John Wilson (Christopher North), but was elected to the professorship of civil history in 1821. About 1826 he took up the study of phrenology, and in 1826 and 1827 he read before the Royal Society of Edinburgh several papers antagonistic to the alleged science. He made his reputation as a philosopher by a series of articles that began to appear in the Edinburgh Review in 1829. In 1836 he was elected to the chair of logic and metaphysics in the University of Edinburgh, and held the position till his death. In 1843 he contributed to the lively ecclesiastical controversy of the time by publishing a pamphlet against the principle of non-intrusion. He was answered by William Cunningham. In July, 1844, he suffered a stroke of paralysis, which made him practically an invalid for the rest of his life.

Hamilton's principal works are: *Discussions on Philosophy and Literature, Education and University Reform* (London, 1852), containing his articles published in the *Edinburgh Review*; *Notes and Dissertations*, published with his edition of *T. Reid's Works* (2 vols., Edinburgh, 1846-63); and his *Lectures on Metaphysics and Logic* (ed. H. L. Mansel and J. Veitch, 4 vols., 1859-60), of which an abridgment of the metaphysical portion (vols. i. and ii.) was edited by F. Bowen (Boston, 1870).

PHILOSOPHICAL VIEWS. Hamilton was an exponent of the Scottish common-sense philosophy and a conspicuous defender and expounder of Thomas Reid, Position in though under the influence of Kant he went beyond the traditions of the common-sense school, combining with a naive realism a theory of the relativity of knowledge. His psychology, while marking an advance on the work of Reid and Stewart, was of the " faculty " variety and has now been largely superseded by other views. His contribution to logic was the now well-known theory of the quantification of the predicate, by which he became the forerunner of the present algebraic school of logicians.

It is his law of the conditioned, with his correlative philosophy of the unconditioned, which comes into nearest relation with theology. This law is " that all that is conceivable in thought lies between two extremes, which, as contradictory of each other, can not both be true, but of which, as mutually contradictory, one must be true. . . . The law of the mind, that the conceivable is in every relation bounded by the inconceivable, I call the law of the conditioned." This involved his position as to tile Infinite-that the Infinite is " incognizable and inconceivable." This doctrine on its philosophic side is a protest against Kant's skeptical result affirming that reason lands in hopeless

contradictions; on its theological side it proclaims the impossibility of knowing the Absolute Being. Only by taking first the philosophic aspect can we correctly interpret its theological relations. Kant had made a priori elements only forms of the mind; and accordingly, the ideas of self, the universe, and God, became only regulative of our intellectual procedure, and in no sense guaranties of truth. Accordingly, Kant has dwelt on " the self-contradiction of seemingly dogmatical cognitions (the cum antithesi) in none of which we can discover any decided superiority." These were, that the world had a beginning, that it had not; that every composite substance consists of simple parts, that no composite thing does consist of simple parts; that causality according to the laws of nature is not the only causality operating to originate the world, that there is no other causality; that there is an absolutely necessary being, that there is not any such being. Hamilton's object was to maintain that such contradictions are not the product of reason, but of an attempt to press reason beyond its proper limits. If, then, we allow that the conceivable is only of the relative and bounded, we recognize at once that the so-called antinomies of reason are the result of attempts to push reason beyond its own province, to make our conceptions the measure of existence, attempting to bring the incomprehensible within the limits of comprehension.

Thus far a real service was rendered by Hamilton in criticizing the skeptical side of Kant's Critique of Pure Reason. He estimated this result so highly as to say of it, " if I have done anything meritorious in philosophy, it is in the attempt to explain the phenomena of these contradictions." At this point Hamilton ranks Reid superior to Kant; the former ending in certainty, the latter in uncertainty. But there remain for Hamilton's philosophy the questions: If we escape contradiction by refusing to attempt to draw the inconceivable within the limits of conception, what is the source of certainty as to the infinite? How are knowledge and thought related to the existence and attributes of the Infinite Being? Here Hamilton is entangled in the perplexity of affirming that to be certain which is yet unknowable. That there is an Absolute Being, source of all finite existence, is, according to him, a certainty; but that we can have any knowledge of the fact is by him denied. Reid had maintained the existence of the Supreme Being as a necessary truth; and Hamilton affirms that the divine existence is at least a natural inference; but he nevertheless holds that the Deity can not be known by us. This is with him an application of the law of the conditioned-a conclusion inevitable under admission that all knowledge implies the relative, the antithesis of subject and object. This doctrine of ignorance was developed by H. L. Mansel, and eagerly embraced by the experientialists, J. S. Mill and Herbert Spencer. This gave an impulse to Agnosticism, the influence of which must be largely credited to Kant, who reduced the a priori to a form of mental procedure, and to Hamilton, who rejected Kant's view, yet regarded -- the absolute as incognizable. However, while insisting that " the infinite God can not by us, in the present limitation of our faculties, be comprehended or conceived," Hamilton adds that "faith-belief is the organ by which we apprehend what is beyond our knowledge."

Hedonism

Philosophers commonly distinguish between psychological hedonism and ethical hedonism. Psychological hedonism is the view that humans are psychologically constructed in such a way that we exclusively desire pleasure. Ethical hedonism is the view that our fundamental moral obligation is to maximize pleasure or happiness. Ethical hedonism is most associated with the ancient Greek philosopher Epicurus (342-270 BCE.) who taught that our life's goal should be to minimize pain and maximize pleasure. In fact, all of our actions should have that aim:

> We recognize pleasure as the first good innate in us, and from pleasure we begin every act of choice and avoidance, and to pleasure we return again, using the feeling as the standard by which we judge every good. [Letter to Menoeceus]

In *A Letter to Menoeceus* - one of his few surviving fragments - Epicurus gives advice on how to decrease life's pains, and explains the nature of pleasure. As to decreasing life's pain, Epicurus explains how we can reduce the psychological anguish that results from fearing the gods and fearing death. Concerning the nature of pleasure, Epicurus explains that at least some pleasures are rooted in natural and, as a rule, every pain is bad and should be avoided, and every pleasure is good and should be preferred. However, there is delicate relation between pain and pleasure. Every pain we have is bad, and we should minimize pain when possible. However, sometimes simply minimizing life's pains is sufficient to attain happiness, and we need to go a step further and actively increase pleasure. He argues that we should not pursue every possible pleasure, such as when they produce more pain. Also, argues that the fewer desires we have, the easier it will be to experience happiness.

During the middle ages, Christian philosophers largely denounced Epicurean hedonism, which they believed was inconsistent with the Christian emphasis on avoiding sin, doing God's will, and developing the Christian virtues of faith, hope and charity. Reniassance philosophers such as Erasmus (1466-1536) revived hedonism and argued that its emphasis on pleasure was in fact compatible with God's wish for humans to be happy. In his famous work *Utopia* (1516), British philosopher Thomas More (1478-1535) explains that "the chief part of a person's happiness consists of pleasure." Like Erasmus, More defends hedonism on religious grounds and argues that, not only did God design us to be happy, but that uses our desire for happiness to motivate us to behave morally. More importantly More distinguishes between pleasures of the mind, and pleasures of the body. He also argues that we should pursue pleasures that are more naturally grounded, so that we do not become preoccupied with artificial luxuries. In the 18th century, the moral theme of pleasure and happiness was more systematically explored by Francis Hutcheson (1694-1747) and David Hume (1711-1776), whose theories were precursors to utilitarianism.

St. Louis Hegelians

The common name given to a group of amateur philosophers founded and led by William Torrey Harris (1835-1909) and Henry Conrad Brokmeyer (1828-1906). Harris, a New Englander born in Connecticut and educated at Yale, first became acquainted with idealism through the Transcendentalists, mainly from his attendance in 1857 at the Orphic Seer's Conversations of Amos Bronson Alcott (1799-1888). The experience inspired Harris to leave Yale before obtaining a degree, and set off west to St. Louis to seek his vocation. Initially he took a position teaching shorthand in the St. Louis Public Schools, but he quickly advanced through the system, eventually becoming Superintendent of Schools, a position he held from 1867 to 1880. Brokmeyer was a Prussian immigrant who arrived in New York as a young man of sixteen. Bold and restless in temperament, he made his way westward, acquiring a small fortune by running a shoe factory in Mississippi. Desiring to further his education, he abandoned his business pursuits to enter Georgetown University in Kentucky, but his quarrelsome character led to his departure for Brown University in Providence, Rhode Island, only to leave that institution as well after a heated debate with President Wayland. The venture to New England, however, did give him an exposure to Transcendentalism, which inspired him, like Harris, once again to head west--first to the back country of Warren County Missouri, where he expended his energy in a close study of German thought, particularly Hegel, and then, in 1856, to St. Louis.

It was there that Harris and Brokmeyer met in 1858 at the St. Louis Mercantile Library, where Harris was offering a public lecture. Brokmeyer convinced Harris of the significance of Hegel's system, and its relevance to the historical trends of American society. They immediately joined forces, attracting a number of other youthful followers with intellectual ambitions, many of whom were, like Harris, teachers in the public schools. The nascent Hegelian movement was temporarily stalled when Brokmeyer went off to serve as a Colonel in the Union Army during the Civil War, but it rebounded in full force upon his return with the formation of the St. Louis Philosophical Society in 1866, and the launching of the *Journal of Speculative Philosophy,* the official organ of the Society, in 1867.

Brokmeyer was the acknowledged intellectual leader of the movement. He published little, but his charismatic personality, quixotic meliorism, and extraordinary skills in argument and debate, consistently employed in the application of Hegelian dialectical logic, established his status as the framer of the ideals and aims of the movement. The manuscript of his translation of Hegel's *Logic*, although never published, became the theoretical text of the group, copied and distributed not only in St. Louis, but to sympathetic thinkers in other parts of the United States. Harris was, more than any other, the movement's public voice and organizing genius. He edited the *Journal,* contributing many of its articles himself. He also orchestrated a number of attempts to bring about a rapprochement between the western and New England idealists, first by inviting Alcott, Harris's former mentor, and Ralph Waldo Emerson to St. Louis, later by his participation in the formation of the Concord School of Philosophy, a summer school headed by Alcott that merged the two

groups within its faculty. (Harris taught for all nine of the sessions of the Concord School's existence, from 1879 to 1887, and his disquisitions on Hegel became the most popular of the faculty's offerings.) But although these efforts furthered the influence of the St. Louisians, they were not, because of philosophical differences, wholly successful.

Even though Harris and Brokmeyer were first inspired to philosophical pursuits by the Transcendentalists, the thought of the St. Louis group was distinguished from the latter by its greater concentration on philosophical understanding guided by Hegelian method, without the literary and theological concerns of the New England movement, and a greater stress on social responsibility and reform. The emerging views of the various members of the group varied somewhat in details, but they shared a common conviction in the relevance of a Hegelian social philosophy, inspired mainly by Hegel's *The Philosophy of Right* and *The Philosophy of History*, to the problems and challenges facing the American society of their day, and the importance of education as a means of effecting necessary social change. Brokmeyer insisted on the necessity that thought issue in practical action directed to the social good, and the St. Louisians took this imperative to heart. The emphasis on education is evident in the pages of their journal, which were largely dedicated to the dissemination of European idealism, either through translations of Hegel and other German writers or summations of their work. They also shared a common enthusiasm for the prospects of their home city, divining by a clever but highly questionable use of the Hegelian dialectic what they believed to be historical forces that would propel St. Louis into an era of cultural supremacy in American society.

Gradually the group dissolved during the 1870s and 1880s as the core members of the group struck out on their own to pursue separate interests and aims. Characteristically, education and moral advancement were the themes of many of these individual pursuits. Denton Snider (1841-1925), a central figure within the movement who eventually became its historian, set upon a course of freelance teaching and lecturing as well as pursuing literary ambitions. In addition to offering lectures throughout the eastern and midwestern United States, including the Concord School, he founded or played a leading role in the operation of a number of visionary educational projects, such as the Communal University in Chicago and later St. Louis, the Chicago Kindergarten College, and the Goethe School in Milwaukee. Thomas Davidson (1840-1900), another key player in the original St. Louis movement, established the Breadwinner's College in New York City, a school devoted to the education of the working class, and later established a summer school at his home in Glenmore, New York.

The theme is echoed in the careers of the St. Louis movement's founders, Harris and Brokmeyer, during and after the dissipation of the movement itself. During his years as Superintendent of Schools in St. Louis, Harris was a strong proponent for the advancement of public education in Missouri. After his involvement at the Concord School he was appointed the United States Commissioner of Education in 1889. Brokmeyer entered the political arena in Missouri, and played a key role in the state's Constitutional Convention of 1875, which established a legal guarantee of education for all between the ages of six and twenty. Brokmeyer eventually served a term as Lieutenant Governor of the state, and acting Governor during 1876 and 1877, but when his political prospects turned against him, he returned to the wilderness life in numerous sojourns to the west. For a time he lived with the Creek Indians in Oklahoma. In 1896 he settled back in St. Louis, returning to a quiet life of scholarship and reflection until his death in 1906.

Despite the fact that the members of the group produced an extraordinary output of published

writing, both in their journal and independently, the movement's ideas had little lasting influence on American philosophy, due in large part to the orthodoxy of their Hegelianism, which was soon overshadowed by the emerging naturalism of American thought during the first decades of the twentieth century. The one exception was George H. Howison (1834-1916), who came under the influence of the group while teaching mathematics at Washington University in St. Louis. Howison later settled in Berkeley, California, and developed a pluralistic form of idealism that survived as the twentieth century school of thought known as Personalism. The most significant contribution of the group to American thought was their journal, which offered a much needed vehicle for the publication of the early work of some of the most prominent figures of the next generation of American philosophy, such as John Dewey, William James, Charles Sanders Peirce, and Josiah Royce. In fact, Harris's encouragement when a young John Dewey timidly submitted his first philosophical essay for publication was crucial in the budding philosopher's decision to continue his studies. Although the ideas of the movement had little enduring influence, the St. Louis Hegelians represent an important chapter in the history of American philosophical thought and the developing relationship between intellectual and popular culture in the nineteenth century.

The Internet Encyclopedia of Philosophy

Claude Adrien Helvetius (1715-1771)

French philosopher; born in Paris January, 1715; died there Dec. 26, 1771. He studied at the College Louis-le Grand, and in 1738 received the lucrative post of farmer-general, which, however, he soon exchanged for the position of chamberlain to the queen. Tiring of the idle and dissipated life of the court, he married in 1751, and retired to a small estate at Vore, in Perche, where he devoted himself chiefly to philosophical studies. He visited England in 1764, and the following year he went to Germany, where he was received with distinction by Frederick II. He was one of the Encyclopedists, and held the skeptical and materialistic views common to that school of philosophy. His principal works are: *De l'esprit* (Paris, 1758; Eng. transl., *De l'Esprit: or, Essays on the Mind*, London, 1759), which, condemned by the Sorbonne and publicly burned at Paris, was translated into most European languages, and read more than any other book of the time; and the posthumous *De l'homme, de ses facultes intellectuelles et de son Mucation* (2 vols., London, 1772; Eng. transl., *A Treatise on Man; his Intellectual Faculties and his Education*, 2 vols.).

IEP

Carl Gustav Hempel (1905 - 1997)

Contents.

LIFE. One of the leading member of logical positivism, he was born in Orianenburg, Germany, in 1905.
Between March 17 and 24, 1982, Hempel gave an interview to Richard Nolan; the text of that interview was published for the first time in 1988 in Italian translation (Hempel, 'Autobiografia intellettuale' in *Oltre il positivismo logico*, Armando : Rome, Italy : 1988). This interview is the main source of the following biographical notes.

Hempel studied at the Realgymnasium at Berlin and, in 1923, he was admitted at the University of Gottingen where he studied mathematics with David Hilbert and Edmund Landau and symbolic logic with Heinrich Behmann. Hempel was very impressed with Hilbert's program of proving the consistency of mathematics by means of elementary methods; he also studied philosophy, but he found mathematical logic more interesting than traditional logic. The same year he moved to the University of Heidelberg, where he studied mathematics, physics and philosophy. From 1924 Hempel studied at Berlin, where he meet Reichenbach who introduced him to the Berlin Circle. Hempel attended Reichenbach's courses on mathematical logic, the philosophy of space and time, the theory of probability. He studied physics with Max Planck and logic with von Neumann. In 1929 Hempel took part in the first congress on scientific philosophy organized by logical positivists. He meet Carnap and -- very impressed by Carnap -- moved to Vienna where he attended three courses with Carnap, Schlick and Waismann, and took part to the meetings of the Vienna Circle. In the same years Hempel qualified as teacher in the secondary school and eventually, in 1934, he gained the doctorate in philosophy at Berlin, with a dissertation on the theory of probability. In the same year he emigrated to Belgium, with the help of a friend of Reichenbach, Paul Oppenheim (Reichenbach introduced Hempel to Oppenheim in 1930). Two years later Hempel and Oppenheim published the book *Der Typusbegriff im Lichte der neuen Logik* on the logical theory of classifier, comparative and metric scientific concepts. In 1937 Hempel was invited -- with the help of Carnap -- at the University of Chicago as Research Associate in Philosophy. After an another brief period in Belgium, Hempel emigrated to USA in 1939. He taught in New York, at the City College (1939-1940) and at the Queens College (1940-1948). In those years he was interested in the theory of confirmation and explanation, and published several articles on that subject -- 'A purely

syntactical definition of confirmation' in *The Journal of Symbolic Logic*, 8, 1943; 'Studies in the logic of confirmation' in *Mind*, 54, 1945; 'A definition of Degree of confirmation' (with P. Oppenheim) in *Philosophy of science*, 12, 1945; 'A note on the paradoxes of confirmation' in *Mind*, 55, 1946; 'Studies in the logic of explanation' (with P. Oppenheim) in *Philosophy of science*, 15, 1948. Between 1948 and 1955 Hempel taught at Yale University. His work *Fundamentals of concept formation in empirical science* was published in 1952 in the *International Encyclopedia of Unified Science*. From 1955 he taught at the University of Princeton. *Aspects of scientific explanation* and *Philosophy of natural science* were published in 1965 and 1966 respectively. After the pensionable age he continued in teaching at Berkley, Irvine, Jerusalem and, from 1976 to 1985, at Pittsburgh. In the meantime, his philosophical perspective was changing and he detached from logical positivism -- 'The meaning of theoretical terms: a critique of the standard empiricist construal' in *Logic, methodology and philosophy of science IV* (ed. by Patrick Suppes), 1973; 'Valuation and objectivity in science' in *Phisycs, philosophy and psychoanalysis* (ed. by R.S. Cohen and L. Laudan), 1983; 'Provisoes: a problem concerning the inferential function of scientific theories' in *Erkenntnis*, 28, 1988. However, he remained affectionately joined to logical positivism: in 1975 he undertook the editorship (with W. Stegmüller and W.K. Essler) of the new series of the journal *Erkenntnis*. Hempel died November 9, 1997, in Princeton Township, New Jersey.

SCIENTIFIC EXPLANATION. Hempel and Oppenheim's essay 'Studies in the logic of explanation', published in volume 15 of the journal *Philosophy of science*, gave an account of the deductive-nomological explanation. A scientific explanation of a fact is a deduction of a statement (called the *explanandum*) that describes the fact we want to explain; the premises (called the *explanans*) are scientific laws and suitable initial conditions. For an explanation to be acceptable, the explans must be true.

According to deductive-nomological model, the explanation of a fact is thus reduced to a logical relationship between statements: the explanandum is a consequence of the explanans. This is a common method in the philosophy of logical positivism. Pragmatic aspects of explanation are not token into consideration. Another feature is that an explanation requires scientific laws; facts are explained when they are subsumed under laws. So the question arise about the nature of a scientific law. According to Hempel and Oppenheim, a *fundamental theory* is defined as a true statement whose quantifiers are not removable (ie a fundamental theory is not equivalent to a statement without quantifiers), and which do not contain individual constants. Every generalized statement which is a logical consequence of a fundamental theory is a *derived theory*. The underlying idea for this definition is that a scientific theory deals with general properties expressed by universal statements. References to specific space-time regions or to individual things are not allowed. For example, Newton laws are true for all bodies in every time in every space. But there are laws (eg the original Kepler laws) that are valid under limited conditions and refer to specific objects, like the Sun and its planets. Therefore there is a distinction between a fundamental theory, which is universal without restrictions, and a derived theory that can contain a reference to individual objects. Note that it is required that theories are true; implicitly, this means that scientific laws are not tools to make predictions, but they are genuine statements that describe the world -- a realistic point of view.

There is another intriguing characteristic of Hempel-Oppenheim model, that is explanation and prediction have exactly the same logical structure: an explanation can be used to forecast and a forecast is a valid explanation. Finally, deductive-nomological model accounts also for the

explanation of laws: in that circumstance, the explanandum is a scientific law and can be proved with the help of other scientific laws.

***Aspect of scientific explanation*, published in 1965, faces the problem of inductive explanation, in which the explanans includes statistical laws. According to Hempel, in such kind of explanation the explanans gives only a high degree of probability to the explanandum, which is not a logical consequence of the premises. The following is a very simple example.**

> **The relative frequency of P with respect to Q is *r***
> **The object *a* belongs to P**
> **--**
> **Thus *a* belongs to Q**

The conclusion "*a* belongs to Q" is not sure, for it is not a logical consequence of the two premises. According to Hempel, this explanation gives a degree of probability *r* to the conclusion. Note that the inductive explanation requires a covering law: the fact is explained by means of scientific laws. But now the laws are not deterministic; statistical laws are admissible. However, in many respects the inductive explanation is similar to the deductive explanation.

- **Both deductive and inductive explanation are nomological ones, ie they require universal laws.**
- **The relevant fact is the logical relation between explanans and explanandum: in deductive explanation the latter is a logical consequence of the former, while in inductive explanation the relationship is an inductive one. But in either the model, only logical aspects are relevant: pragmatic features are not token in account.**
- **The symmetry between explanation and prediction is preserved.**
- **The explanans must be true.**

PARADOXES OF CONFIRMATION. During his researches on confirmation, Hempel formulated the so-called paradoxes of confirmation. Hempel's paradoxes are a straightforward consequence of the following apparently harmless principles:

- **the statement (*x*)(R*x* --> B*x*) is supported by the statement (R*a* & B*a*)**
- **if P_1 and P_2 are logically equivalent statements and O_1 confirms P_1, then O_1 also supports P_2.**

Hence (~R*a* & ~B*a*), which confirms (*x*)(~B*x* --> ~R*x*), also supports (*x*)(R*x* --> B*x*). Now suppose R*x* means "*x* is a raven" and B*x* means "*x* is black". Therefore "*a* isn't a raven and isn't black" confirms "all ravens are black". That is, the observation of a red fish supports the hypothesis that all ravens are black. Note that also the statement (*x*)((~R*x* v R*x*) --> (~R*x* v B*x*)) is equivalent to (*x*)(R*x* --> B*x*); thus (~R*a* v B*a*) supports "all ravens are black" and hence the observation of whatever thing which is not a raven (tennis-ball, paper, elephant, red herring) supports "all ravens are black".

CONCEPT FORMATION IN EMPIRICAL SCIENCE. In his monograph *Fundamentals of concept formation in empirical science* (1952) Hempel describes the methods according to which physical quantities are defined. I shall briefly summarize the results of Hempel's research. I employ the very same example used by Hempel: the measurement of mass.

An equal-armed balance is used to determine when two bodies have the same mass and when the mass of a body is greater than the mass of the other. Two bodies have the same mass if, when they are on the pans, the balance remains in equilibrium. If a pan goes down and the other up, then the body in the lowest pan has a greater mass. From a logical point of view, this procedure defines two relations, say E and G, so that

- **E(*a*,*b*) if and only if *a* and *b* have the same mass;**
- **G(*a*,*b*) if and only if the mass of *a* is greater that the mass of *b*.**

The relations E and G satisfy the following conditions:

1. **E is a reflexive, symmetric and transitive relation.**
2. **G is an irreflexive, asymmetric and transitive relation.**
3. **E and G are mutually exclusive, ie if E(*a*,*b*) then not G(*a*,*b*).**
4. **for every *a* and *b*, one and only one of the following assertions is true:**

    E(*a*,*b*)   G(*a*,*b*)   G(*b*,*a*)

Relations E and G thus define a partial order.

The second step consists in defining a function m which satisfies the following three conditions.

5. **A suitable prototype is chosen, whose mass is one kilogram.**
6. **If E(*a*,*b*) then m(*a*)=m(*b*).**
7. **It is defined an operation, say ©, which combines two bodies *a* and *b*, so that**

    m(*a* © *b*) = m(*a*) + m(*b*)

Conditions (1)-(7) describe not only the measurement of mass but also of length, of time and of every extensive physical quantity (a quantity is called *extensive* if there is an operation which combines the objects according to condition 7, otherwise it is called *intensive*; for example temperature is intensive).

THE LATE HEMPEL. In 'The meaning of theoretical terms', 1973, Hempel criticizes an aspect of logical positivism's theory of science: the distinction between observational and theoretical terms and the related problem about the meaning of theoretical terms. According to Hempel, there is an implicit assumption in neopositivist analysis of science, that is the meaning of theoretical terms can be explained by means of linguistic methods. Therefore the very problem is how can be determined a set of statements that gives a meaning to theoretical terms. Hempel analyzes the various theories proposed by logical positivism.

According to Schlick, the meaning of theoretical concepts is determined by the axioms of the theory; that axioms thus play the role of implicit definitions. Therefore theoretical terms must be interpreted in a way that makes the theory true. But according to such interpretation -- Hempel objects -- a scientific theory is always true, for it is true by convention, and thus every scientific theory is a priori true. This is a prove -- Hempel says -- that Schlick's interpretation of the meaning of theoretical terms is not tenable. Also the thesis which asserts that the meaning of a theoretical term depends on the theory in which that term is used is, according to Hempel, untenable.

Another solution to the problem of the meaning of theoretical terms is based on the rules of

correspondence (also known as meaning postulates). They are statements in which observational and theoretical terms occur. Theoretical terms thus gain a partial interpretation by means of observational terms. Hempel raises two objections to this theory. First of all, he asserts that observational concepts do not exist. When a scientific theory introduces new theoretical terms, they are linked with other old theoretical terms that usually belong to another already consolidated scientific theory. Therefore the interpretation of new theoretical terms is not based on observational terms but it is given by other theoretical terms that, in a sense, are more familiar than the new ones. The second objection is about the conventional nature of rules of correspondence. A meaning postulate defines the meaning of a concept and therefore, from a logical point of view, it must be true. But every statement in a scientific theory is falsifiable, and thus there is not any scientific statement which is beyond the jurisdiction of the experience. So also a meaning postulate can be false; hence it is not conventional and thus it does not define the meaning of a concept but it is a genuine physical hypothesis. So meaning postulate do not exist.

'Provisoes: a problem concerning the inferential function of scientific theories' published in *Erkenntnis*, 1988, criticizes another aspect of logical positivism's theory of science: the deductive nature of scientific theories. It is very interesting that a philosopher who is famous for his deductive model of scientific explanation moved a criticism to the deductive model of science. At least this fact shows the open views of Hempel. He argues that it is impossible to derive observational statements from a scientific theory. For example, Newton's theory of gravitation cannot determine the position of planets, even if the initial conditions are known, for Newton's theory deals with the gravitational force, and thus the theory cannot forecast the influences exerted by other kinds of force. In other words, Newton's theory requires an explicit assumption -- a provisoe, according to Hempel -- which assures that the planets are subjected only to the gravitational force. Without such hypothesis it is impossible to apply the theory to the study of planetary motion. But this assumption does not belong to the theory. Therefore the position of planets is not determined by the theory, but it is implied by the theory *plus* appropriate assumptions. Accordingly, not only observational statements are not entailed by the theory, but also there are no deductive links between observational statements. Hence it is impossible that an observational statement is a logical consequence of a theory (unless the statement is logically true). This fact has very important outcomes.

One of them is that the empirical content of a theory does not exist. Neopositivists defined it as the class of observational statements implied by the theory; but this class is an empty set.

Another consequence is that theoretical terms are not removable from a scientific theory. Known methods employed to accomplish this task assert that, for every theory T, it is possible to find a theory T* without theoretical terms so that an observational statement O is a consequence of T* if and only if it is a consequence of T. Thus it is possible to eliminate theoretical terms from T without loss of deductive power. But -- Hempel argues -- no observational statement O is derivable from T, so that T* lacks empirical consequence.

Suppose T is a falsifiable theory; therefore there is an observational statement O so that ~O --> ~T. Hence T --> ~O; so T entails an observational statement ~O. But no observational statement is a consequence of T. Thus the theory T is not falsifiable. The consequence is that every theory is not falsifiable. (Note: Hempel's argument is evidently wrong, for according to Popper the negation of an observational statement usually is not an observational statement).

Finally, the interpretation of science due to instrumentalism is not tenable. According to such interpretation, scientific theories are rules of inference, that is they are prescriptions according to which observational statements are derived. Hempel's analysis shows that these alleged rules of inference are indeed void.

BIBLIOGRAPHY. The following is a short list of Hempel's main works.

Heraclitus (535-475 BCE.)

Heraclitus was a Presocratic Greek philosopher of Ephesus, who lived about BCE. 535-475. The date of Heraclitus is roughly fixed by his reference in the past tense to Hekataios, Pythagoras, and Xenophanes (fr. 16), and by the fact that Parmenides appears to allude to him in turn (fr. 6). This means that he wrote early in the fifth century BCE. He was an Ephesian noble, and had a sovereign contempt for the mass of mankind. He lived during the time of the first Persian domination over his native city. As one of the last of the family of Androclus, the descendant of Codrus, who had founded the colony of Ephesus, Heraclitus had certain honorary regal privileges, which he renounced in favor of his brother. He likewise declined an invitation of King Darius to visit his court. He was an adherent of the aristocracy, and when, after the defeat of the Persians, the democratic party came into power, he withdrew in ill-humor to a secluded estate in the country, and gave himself up entirely to his studies. In his later years he wrote a philosophical treatise, which he deposited in the temple of Artemis, making it a condition that it should not be published till after his death. He was buried in the marketplace of Ephesus, and for several centuries later the Ephesians continued to engrave his image on their coins.

His great work "On Nature" (*peri phuseos*), in three books, was written in the Ionian dialect, and is the oldest monument of Greek prose. Considerable fragments of it have come down to us. The language is bold, harsh, and figurative; the style is so careless that the syntactical relations of the words are often hard to perceive; and the thoughts are profound. All this made Heraclitus so difficult a writer that he went in antiquity by the name "the Obscure" (*skoteinos*), and Lucretius attacks him on the ground (i. 638-644). From his gloomy view of life he is often called "the Weeping Philosopher," as Democritus is known as "the Laughing Philosopher." It is above all in dealing with Heraclitus that we are made to feel the importance of personality in shaping systems of philosophy. But it was not only the common run of men that Heraclitus despised; he had not even a good word for any of his predecessors. He agrees, of course, with Xenophanes in criticizing Homer, but Xenophanes himself falls under an equal condemnation. In a remarkable fragment (fr. 16) he mentions him along with Hesiod, Pythagoras, and Hekataois as an instance of the truth that much learning does not teach men to think. The researches of Pythagoras, by which we are to understand his harmonic and arithmetical discoveries, are rejected with special emphasis (fr. 17). Wisdom is not a knowledge of many things; it is the clear knowledge of one thing only, and this Heraclitus describes, in true prophetic style, as his Logos (word/fire), which is 'true evermore', though men cannot understand it even when it is told to them (fr. 2). Perfect knowledge is only given to the gods, but a progress in knowledge is possible to men. We must try, then, to discover, what Heraclitus meant by his Logos, the thing he felt he had been born to say, whether anyone would listen to him or not.

As fire is the primary form of reality, the process of combustion is the key both to human life and to that of the world. It is a process that never rests; for a flame must always be fed by fresh exhalations as fuel, and it is always turning into vapor or smoke. The steadiness of the flame

depends on the 'measures' of fuel kindled and the 'measures' of fire extinguished in smoke remaining constant. Now the world is 'an everliving fire' (fr. 20), and therefore there will be an unceasing process of eternal flux (*panta pei*). For Hereclitus, *everything* is in this process of flux, and nothing therefore, not even the world in its momentary form, nor the gods themselves, can escape final destruction. That will apply to the world at large (macrocosm) and also to the soul of humans (microcosm). Concerning the larger world, 'You cannot step twice into the same river' (fr. 41); concerning the human soul, it is just as true that 'we are and are not' at any given moment. As fire changes continually into water and then into earth, so earth changes back to water and water again to fire. The world, therefore, arose from fire, and in alternating periods is resolved again into fire, to form itself anew out of this element. The division of unified things into a multiplicity of opposing phenomena is "the way downwards," and is the consequence of a war and a strife. Harmony and peace lead back to unity by "the way upwards." Nature is constantly dividing and uniting herself, so that the multiplicity of opposites does not destroy the unity of the whole.

A glance at the fragments will show that the thought of Heraclitus was dominated by the opposition of sleeping and waking, life and death, and that this seemed to him the key to the traditional Milesian problem of the opposites, hot and cold, wet and dry. He finds these opposites both at the level of the human soul and the larger cosmos. At the human level, the soul is only fully alive when it is awake, and that sleep is really a stage between life and death. If we look next at the macrocosm, we shall see the explanation is the same. Night and day, summer and winter, alternate in the same way as sleep and waking, life and death, and here too it is clear that the explanation is to be found in the successive advance of the wet and the dry, the cold and the hot. The existence of these opposites depends only on the difference of the motion on "the way upwards" from that on "the way downwards"; all things, therefore, are at once identical and not identical. The principle of the universe is "becoming," which implies that everything is and, at the same time, is not, so far as the same relation is concerned. 'The way up and the way down', which are 'one and the same' (fr. 69) are also the same for the microcosm and the macrocosm. Fire, water, earth is the way down, and earth, water, fire is the way up. And these two ways are forever being traversed in opposite directions at once, so that everything really consists of two parts, one part traveling up and the other traveling down.

Paradoxically the everlasting fire of the world which creates its flux, also secures its stability. For the same 'measures' of fire are always being kindled and going out (fr. 20). It is impossible for fire to consume its nourishment without at the same time giving back what it has consumed already. It is a process of eternal 'exchange' like that of gold for wares and wares for gold (fr. 22); and 'the sun will not exceed his measures; if he does, the Erinyes, the auxiliaries of Justice, will find him out' (fr. 29). For all this strife is really justice (fr. 22), not injustice, as Anaximander had supposed, and 'War is the father of all things' (fr. 44). It is just this opposite tension that keeps things together, like that of the string in the bow and the lyre (fr. 45), and though it is a hidden attunement, it is better than any open one (fr. 47). For all his condemnations of Pythagoras, Heraclitus cannot get away from the tuned string.

With all his originality, Heraclitus remains an Ionian. In a sense, Heraclitus substituted fire for the 'air' of Anaximenes, who in turn had substituted 'air' for the water of Thales. Also, Hereclitus' notion of flux is a development of that Anaximenes' notion of rarefaction and condensation. Although Hereclitus has a doctrine of the soul, his fire-soul is as little personal as the breath-soul of Anaximenes. Some fragments superficially appear to assert the immortality of the individual soul. But, when we examine them, we see they cannot bear this interpretation. Soul is only immortal in

so far as it is part of the everliving fire which is the life of the world. Seeing that the soul of every man is in constant flux like his body, what meaning can immortality have? It is not only true that we cannot step twice into the same river, but also that we are not the same for two successive instants. That is just the side of his doctrine that struck contemporaries most forcibly, and Epicharmos already made fun of it by putting it as an argument into the mouth of a debtor who did not wish to pay. How could he be liable, seeing he is not the same man that contracted the debt?

Edward Herbert of Cherbury (1583-1648)

Life. Edward Herbert, was born at Eyton in Shropshire on March 3, 1583. He is the representative of a branch of the noble Welsh family of that name, and the elder brother of George Herbert the poet. He matriculated at University College, Oxford, in 1595, married in 1599, and continued to reside at Oxford till about 1600, when he removed to London. He was made a Knight of the Bath soon after the accession of King James. From 1608 to 1618 he spent most of his time on the continent as a soldier of fortune, occasionally seeking the company of scholars in the intervals of his campaigns, chases, or duels. In 1619 he was appointed ambassador at Paris; after his recall in 1624 King James rewarded him with an Irish peerage. He was created an English peer as Baron Herbert of Cherbury in 1629. The civil war found him unprepared for decision; but he ultimately saved his property by siding with the parliament. He died in London on 20 August 1648.

Writings. His works were historical, literary, and philosophical. His account of the Duke of Buckingham's expedition an his history of Henry VIII were written with a view to royal favor. The latter was published in 1649; a Latin version of the former appeared in 1658, the English original not till 1860. His literary works -- poems and autobiography -- are of higher merit. His poems were published by his son in 1665, and his autobiography was first printed by Horace Walpole in 1764. His philosophical works give him a distinct place in the history of thought. His greatest work, *De Veritate*, was, he tells us, begun in England and "formed there in all its principal parts.." Hugo Grotius, to whom he submitted the manuscript, advised its publication; but it was not till this advice had been sanctioned (as he thought) by a sign from heaven that he had the work printed (Paris, 1624). To the third edition (London, 1645) he added a short treatise *De Causis Errorum*, a dissertation entitled *Religio Laici*, and an *Appendix ad Sacerdotes*. In 1663 appeared his *De Religione Gentilium* -- a treatise on what is now called comparative religion. A popular account of his views on religion was published in 1768 under the title ; although the external evidence is incomplete, it may have been from his pen.

Truth. Herbert does not stand in the front rank of speculative thinkers; but his claims as a philosopher are worthy of note. Like Francis Bacon he was occupied with the question of method; and his inquiry went deeper, though it was less effective upon philosophical opinion. Bacon investigated the criteria and canons of evidence, whereas Herbert sought to determine the nature and standard of truth. Descartes soon afterwards referred to the question and put it aside, saying of Herbert: "he examines what truth is; for myself, I have never doubted about it, as it seems to me to be a notion so transcendentally clear that it is impossible to ignore it" (letter of Oct. 16, 1639). The problem which Herbert put before himself concerned the conditions of knowledge; and it has bearing upon later thought, though it arises out of traditional views. In the end of the following century Kant said that his own new point of view was due to discarding the belief that "all our cognitions must conform to objects," which had been "hitherto assumed." This was, indeed the prevailing doctrine. Perception was held to be a "passio mentis" produced by the activity of the

object which impressed its image (or, to use the term which Descartes and Locke made familiar, an idea) upon the mind. this view was rejected by Herbert as decidedly as by Kant, though he did not anticipate the Kantian revolution by assuming that "objects must conform to our cognition."

The distinction between mind and body had not yet been sharpened and turned into antagonism by the Cartesian dualism. Man is a complex of mind and body, and, according to Herbert, all that is passive in him is body (*De Veritate*, 3rd ed., p. 72). -- though body itself is not purely passive. Mind, however, is never passive. It acts but is not acted upon (*ibid*. p. 95). Things do not act upon it but are put within the sphere of its operation (*ibid*. p. 95). Nevertheless, it requires an occasion, or the presence of objects, to awaken its activity, even in its highest operations (*ibid*. p. 91). Herbert's expressions are not quite consistent, for this awakening of mental activity is itself an effect upon mind; but perhaps he might have defended his doctrine by appealing to the harmony which exists between faculty and object. For in this lies his fundamental conception -- different alike from the traditional view that cognition must conform to objects, and from the Kantian view that objects must conform to cognition. the mental faculty supplies a form analogous to the object as it exists (*ibid*. p. 97); the object, again,, neither undergoes an alteration of nature nor produces one, but only enters, as it were, into the faculty's range of view. The whole process is only intelligible on the supposition of a harmony between the world and the human mind. In this harmony the human body, fashioned out of the material of the external world and containing the sense-apparatus which lead to the "inner court" of consciousness, forms the bond of union.

Herbert's doctrine of the nature of truth rests on this conception of harmony. "Truth," he says, "is a certain harmony between objects and their analogous faculties" (*ibid*. p. 68). Four kinds or degrees of truth are distinguished by him: truth of the thing; truth of appearance; truth of concept; and truth of intellect. These seem to be arranged in an ascending scale. The first does not exclude the others; the last includes all the preceding, being the 'conformity' of the several 'conformities' they involve. The conditions of truth are also made to explain the possibility of error, for the causes of error lie in the intermediate stages between the thing and the intellect. The root of all error is in confusion -- in the inappropriate connection of faculty and object -- and it is for the intellect to expose the inappropriate connection and so to dissipate the error.

The doctrine arrived at is summed up in seven propositions (*ibid*. pp. 8-12); and all these hinge upon the postulate that mind corresponds with things not only in their general nature but in all their differences of kind, generic and specific. Every object is cognate to some mental power or faculty, and to every difference in the object there corresponds a different faculty. Herbert attempts no account of nature, and his psychology is only introduced in the interests of his doctrine of truth; but it is clear that there cannot be fewer faculties than there are differences of things. A faculty is defined as any internal force which unfolds a different mode of apprehension (*sensus*) to a different object (*ibid*. p. 30); and faculties are spoken of as *radii animae*, which perceive objects, or rather the image given out by objects, in accordance with mutual analogy. These images may be conveyed by the same sense-apparatus and yet be apprehended by different faculties, as is the case with figure and motion (*ibid*. p. 78). Hence countless faculties; but their very multiplicity suggests that Herbert cannot have attributed to them the same degree of independence as did the 'faculty-pschologists' of a recent generation. They may be said to be simply modes of mental operation; and mind operates differently as different kinds of objects are brought before it, showing always an aspect of its cognitive power analogous to the object.

Reflecting upon the various modes of mental activity, we may arrange these faculties into four classes: natural instinct, internal sense, external sense, and discourse or reasoning. These are not

separate powers; and, although Herbert may have sometimes spoken of them as such, another doctrine may be found in his writings. According to this doctrine all mental faculty is regarded as informed in less or greater measure by the intellect, which is itself a manifestation in humans of the universal divine providence. "Our mind," he says, "is the highest image and type of the divinity, and hence whatever is true or good in us exists in supreme degree in God. Following out this opinion, we believe that the divine image has also communicated itself to the body. but, as in the propagation of light there is growing loss of distinctness as it gets farther from its source, so that divine image, which shines clearly in our living and free unity, first communicates itself to natural instinct or the common reason of its providence, then extends to the numberless internal and external faculties (analogous to particular objects), closes into shade and body, and sometimes seems as it were to retreat into matter itself" (*ibid*. p. 78).

The name 'natural instinct' is badly chosen; but it is not difficult to see what Herbert means by it. In particular, it is the home of those 'common notions' (as he calls them) which may be said to underlie all experience and to belong to the nature of intelligence itself. Some of these common notions are formed without any assistance from discourse or the ratiocinative faculty; others are only perfected by the aid of discourse. The former class is distinguished by certain tests or marks. Some of these tests are logical (such as independence, certainty, and necessity); others are psychological (such as priority in time and universality). but it is the last-named mark or "universal consent" that is made by him "the highest rule of natural instinct (*ibid*. p. 60), and "the highest criterion of truth" (*ibid*. p. 39).

This appeal to universal consent makes Herbert a precursor of the philosophy of Common Sense, and lays him open to the criticism urged by Locke that there are no truths which can satisfy the test, there being nothing so certain or so generally known that it has not been ignored or denied by some. Herbert made little if any use of the tests by which he might have shown that certain common notions are presupposed in the constitution of experience, and thus failed to carry out the theory of knowledge of which at times he had a clear view.

Deism. The common notions are practical as well as theoretical -- yield the first principles of morals as well as those of science. but he attempted no complete account of them and limited his investigation o the common notions of religion. To this portion of his work his direct influence as a thinker is chiefly due, for it determined the scope and character of the English Deistical movement. The common notions of religion are, he holds, the following: (1) that there is a supreme Deity; (2) that this Deity ought to be worshipped; (3) that virtue combined with piety is the chief part of divine worship; (4) that men should repent of their sins and turn from them; (5) that reward and punishment follow from the goodness and justice of God, both in this life and after it. These five articles contain the whole doctrine of the true catholic church, that is to say, of the religion of reason. They also formed the primitive religion before the people "gave ear to the covetous and crafty sacerdotal order." What is contrary to the 'five points' is contrary to reason and therefore false; what is beyond reason but not contrary to it may be revealed: but the record of a revelation is not itself revelation but tradition; and the truth of a tradition depends upon the narrator and can never be more than probable.

A separate work -- *De Religione Gentilium* -- was devoted to the verification of these results on the field of what is now called comparative religion. In respect of this work the claim may be justly made for Herbert that he was one of the first -- if not the first -- to make a systematic effort after a comparative study of religions. but he had no idea of the historical development of belief, and he

looked upon all actual religions -- in so far as they went beyond his five articles -- as simply corruptions of the pure and primitive rational worship.

Hippias (5th cn. BCE.)

A Greek sophist of Elis and a contemporary of Socrates. He taught in the towns of Greece, especially at Athens. He had the advantage of a prodigious memory, and was deeply versed in all the learning of his day. He attempted literature in every form which was then extant. He also made the first attempt in the composition of dialogues. In the two Platonic dialogues named after him (*Hippias Major* and *Hippias Minor*), he is represented as excessively vain and arrogant.

Hippias is chiefly memorable for his efforts in the direction of universality. He was the enemy of all specialization, and appeared at Olmpia gorgeously attired in a costume entirely of his own making down to the ring on his finger. He was prepared to lecture to anyone on anything, from astronomy to ancient history. Such a man had need of a good memory, and we know that he invented a system of mnemonics. There was a more serious side to his character, however. This was the age when people were still optimistic of squaring the circle by a geometrical construction. The lunules of Hippocrates of Chios belong to it, and Hippias, the universal genius, could not be left behind here. He invented the curve still known as the quadratix, which would solve the problem if it could be mechanically described. Hippias appears to have originated the idea of natural law as the foundation of morality, distinguishing nature from the arbitrary conventions or fashions, differing according to the different times or regions in which they arise, imposed by arbitrary human enactment, and often unwillingly obeyed. He held that there is an element of right common to the laws of all countries and constituting their essential basis. He held also that the good and wise of all countries are naturally akin and should regard one another as citizens of a single state. This idea was subsequently developed by the Cynic and still more by the Stoic schools, passing from the latter to the jurists, in whose hands it became the great instrument fro converting roman law into a legislation for a people.

Thomas Hobbes (1588-1679)

EARLY LIFE. Thomas Hobbes was born at Westport, adjoining Malmesbury in Wiltshire, on April 5, 1588. His father, the vicar of the parish (so John Aubery tells us), "was one of the ignorant Sir Johns of Queen Elizabeth's time, could only read the prayers of the church and the homilies, and valued not learning, as not knowing the sweetness of it" (Letters written by eminent persons. . .and Lives of eminent men, 1813). Hobbes led a sheltered and leisured life. His education was provided for by an uncle, a solid tradesman and alderman of Malmesbury. He was already a good Latin and Greek scholar when, not yet fifteen, he was sent to Magdalen Hall, Oxford. On leaving Oxford, in 1608, he became companion to the eldest son of Lord Cavendish of Hardwicke (afterwards created Earl of Devonshire), and his connection with the Cavendish family lasted (although not without interruptions) till his death.

Three times in his life, Hobbes traveled on the continent with a pupil. His first journey was begun in 1610, and in it he visited France, Germany, and Italy, learning the French and Italian languages, and gaining experience, but not yet conscious of his life's work. On his return (the date is uncertain), he settled down with his young lord at Hardwick an din London. His secretarial duties were light, and he set himself to become a scholar. To this period, belongs his acquaintance with Bacon, Herbert of Cherbury, Ben Johnson, and other leading men of the time.

Hobbes's pupil and friend died in 1628, two years after the death of the first earl; his son and successor was a boy of eleven; his widow did not need the services of a secretary; and, for a time, there was no place in the household for Hobbes. In 1629, he left for the continent again with a new pupil, returning from this second journey in 1631 to take charge of the young earl's education. "He was forty years old before he looked on geometry, which happened accidentally; being in a gentleman's library in. . . Euclid's Elements lay open. About this time also, or soon afterwards, his philosophical views began to take shape. Among his manuscripts there is a *Short Tract on First Principles* (*Elements Of Law*, ed. Toonies, 1889, pp. 193-210), which has been conjectured to belong to the year 1630. It shows the author so much impressed by his reading of Euclid as to adopt the geometrical form (soon afterwards used by Descartes) for the expression of his argument.

When Hobbes made his third visit to the continent, which lasted from 1634 to 1637 and on which he was accompanied by the young Earl of Devonshire, he is found taking his place among philosophers. At Paris, he was an intimate of Mersenne, who was the center of a scientific circle that included Descartes and Gassendi; and at Florence he held discourse with Galileo. After his return to England he wrote, with a view to publication, a sketch of his new theory, to which he gave the title *Elements of Law natural and politic*. The treatise was never published by Hobbes, nor did it appear as a connected whole until 1889, although in 1650, probably with his consent, its first thirteen chapters were issued with the title *Human Nature*, and the remainder of the volume as a separate work *De Corpore Politico*. In November 1640, when the Long Parliament began to show signs of activity threatening civil war, Hobbes was "the first of all that fled" to France; he thus describes himself as a "man of feminine courage". He remained in France for the next 11 years. By his influence, Hobbes was appointed to teach mathematics to Charles, Prince of Wales, who

arrived in Paris in 1646. Of greater interest is another literary correspondence which followed close upon his arrival in Paris. Mersenne was then collecting the opinions of scholars on the forthcoming treatise by Descartes, *Meditationes de prima philosophia*, and in January 1641, Hobbes's objections were ready and forwarded to his great contemporary in Holland. These, with the replies of Descartes, afterwards appeared as the third set of *Objectiones* when the treatise was published. Further communications followed on the *Dioptrique* which had appeared along with the famous *Discours de la methode* in 1637. Descartes did not discover the identity of his two critics; but he did not approve of either. To Descartes, mend was the primal certainty and independent of material reality. Hobbes, on the other hand, had already fixed on motion as the fundamental fact, and his originality consisted in his attempt to use it for the explanation not of nature only, but also of mind and society. Two or three years after his correspondence with Descartes, Hobbes contributed a summary of his views on physics and a *Tractatus Opticus* to works published by Mersenne.

LATER LIFE AND WRITINGS. At least by the beginning of his residence in Paris in 1640, Hobbes had matured the plan for his own philosophical work. It was to consist of three treatises, dealing respectively with matter or body, with human nature, and with society. It was his intention, he says, to have dealt with these subjects in this order, but his country "was boiling hot with questions concerning the rights of dominion, and the obedience due from subjects, the true forerunners of an approaching war," and this cause, as he said, "ripened and plucked from me this third part" of the system--the book *De Cive*, published at Paris in 1642. When stable government seemed to have been re-established by the Commonwealth, he had it published in London, in an English version from his own hand, as *Philosophical Rudiments concerning Government and Society*. The same year, 1651, saw the publication, also in London, of his greatest work, *Leviathan*, and his own return to England, which now promised a sager shelter to the philosopher than France, where he feared the clergy and was no longer in favor with the remnant of the exiled English court.

The last twenty-eight years of Hobbes's long life were spent in England; and there he soon returned to the house of his old pupil the Earl of Devonshire, who had preceded him in submitting to the Commonwealth and like him welcomed the king on his return. For a year or two after his home-coming, Hobbes resided in London, busied with the completion of his philosophical system, the long-delayed first part of which, *De Corpore*, appeared in 1655, and the second part, *De Homine*, in 1656. The latter work contains little or nothing of importance that Hobbes had not said already; but the former deals with the logical, mathematical, and physical principles which were to serve as foundation for the imposing structure he had built. In 1654, the tract *Of Liberty and Necessity*, which he had written eight years before in reply to the bishop Bramhall's arguments, was published by some person unnamed into whose hands it had fallen. Not suspecting Hobbes's innocence in the matter of the publication, Bramhall replied with some heat on the personal question and much fullness on the matter in hand in the following year; and this led to Hobbes's elaborate defense is *The Questions concerning Liberty, Necessity, and Chance*, published in 1656.

A bill aimed at blasphemous literature passed the Commons in January 1667, and *Leviathan* was one of two books mentioned in it. The bill never passed both houses; but Hobbes was seriously frightened. He is said to have become more regular at church and communion. He also studied the law of heresy, and wrote a short treatise on the subject, proving that there was no court by which he could be judged. But he was not permitted to excite the public conscience by further publications on matters of religion. A Latin translation of *Leviathan* (containing a new appendix

bringing its theology into line with the Nicene creed) was issued at Amsterdam in 1668. Other works, however, dating from the same year, were kept back--the tract on *Heresy*, the answer to Bramhall's attack on *Leviathan*, and *Behemoth: the History of the Causes of the Civil Wars of England*. About the same time was written his *Dialogue between a Philosopher and a Student of the Common Laws of England*. His *Historia Ecclesiastica*, in elegiac verse, dates from about his eightieth year. When he was eighty-four, he wrote his autobiography in Latin verse. In 1673, he published a translation in rhymed quatrains of four books of the *Odyssey*; and he had completed both *Iliad* and *Odyssey* when, in 1675, he left London for the last time. Thereafter he lived with the Cavendish family at one of their seats in Derbyshire. He died at Hardwick on December 4, 1679.

THE STATE OF NATURE. In his brief introduction to the *Leviathan*, Hobbes describes the state as an organism analogous to a large person. He shows how each part of the state parallels the function of the parts of the human body. He notes that the first part of his project is to describe human nature, insofar as humans are the creators of the state. To this end, he advises that we look into ourselves to see the nature of humanity in general. Hobbes argues that, in the absence of social condition, every action we perform, no matter how charitable or benevolent, is done for reasons which are ultimately self-serving. For example, when I donate to charity, I am actually taking delight in demonstrating my powers. In its most extreme form, this view of human nature has since been termed psychological egoism. Hobbes believes that any account of human action, including morality, must be consistent with the fact that we are all self-serving. In this chapter. Hobbes speculates how selfish people would behave in a state of nature, prior to the formation of any government He begins noting that humans are essentially equal, both mentally and physically, insofar as even the weakest person has the strength to kill the strongest. Given our equal standing, Hobbes continues noting how we are situations in nature make us naturally prone to quarrel. There are three natural causes of quarrel among people: competition for limited supplies of material possessions, distrust of one another, and glory insofar as people remain hostile to preserve their powerful reputation. Given the natural causes of quarrel, Hobbes concludes that the natural condition of humans is a state of perpetual war of all against all, where no morality exists, and everyone lives in constant fear:

> **In such condition, there is no place for industry, because the fruit thereof is uncertain; and consequently no culture of the earth, no navigation, nor use of the commodities that may be imported by sea; no commodious building, no instruments of moving and removing such things as require much force; no knowledge of the face of the earth, no account of time, no arts, no letters, no society; and which is worst of all, continual fear and danger of violent death; and the life of people, solitary, poor, nasty, brutish, and short.**

Hobbes continues offering proofs that the state of nature would be as brutal as he describes. We see signs of this in the mistrust we show of others in our daily lives. In countries which have yet to be civilized people treat are barbaric to each other. Finally, in the absence of international law, strong countries pray on the weakness of weak countries. Humans have three motivations for ending this state of war: the fear of death, the desire to have an adequate living, and the hope to attain this through one's labor. Nevertheless, until the state of war ends, each person has a right to everything, including another person's life.

LAWS OF NATURE. In articulating the peace-securing process, Hobbes draws on the language of the natural law tradition of morality, which was then championed by Dutch politician Hugo Grotius (1583-1645). According to Grotius, all particular moral principles derive from immutable

principles of reason. Since these moral mandates are fixed in nature, they are thus called "laws of nature." By using the jargon of natural law theory, Hobbes is suggesting that, from human self-interest and social agreement alone, one can derive the same kinds of laws which Grotius believes are immutably fixed in nature. Throughout his discussion of morality, Hobbes continually re-defines traditional moral terms (such as right, liberty, contract, and justice) in ways which reflects his account of self-interest and social agreement. For Grotius and other natural law theorists, a law of nature is an unchangeable truth which establishes proper conduct. Hobbes defines a law of nature as follows:

> **A Law of Nature (lex naturalis) is a precept, or general rule, found out by reason, by which a person is forbidden to do that which is destructive of his life, or takes away the means of preserving the same; and to omit that by which he thinks it may be best preserved.**

Hobbes continues by listing specific laws of nature all of which aim at preserving a person's life. Hobbes's first three Laws of Nature are the most important since they establish the overall framework for putting an end to the state of nature. Given our desire to get out of the state of nature, and thereby preserve our lives, Hobbes concludes that we should seek peace. This becomes his first law of nature:

> **"That every person ought to endeavor peace as far as he has hope of obtaining it; and when he cannot obtain it, that he may seek and use all helps and advantages of war; the first branch of which rule contains the first and fundamental Law of Nature, which is, To seek peace and follow it; the second, the sum of the right of nature, which is, By all means we can, to defend ourselves.**

The reasonableness of seeking peace, indicated by the first law, immediately suggests a second law of nature, which is that we mutually divest ourselves of certain rights (such as the right to take another person's life) so to achieve peace:

> **That a person be willing, when others are so too (as far-forth as for peace and defense of himself he shall think it necessary), to lay down this right to all things; and be contented with so much liberty against other people, as he would allow other people against himself.**

The mutual transferring of these rights is called a contract and is the basis of the notion of moral obligation and duty. For example, I agree to give up my right to steal from you, if you give up your right to steal from me. We have then transferred these rights to each other and thereby become obligated to not steal from each other. From selfish reasons alone, we are both motivated to mutually transfer these and other rights, since this will end the dreaded state of war between us. Hobbes continues by discussing the validity of certain contracts. For example, contracts made in the state of nature are not generally binding, for, if I fear that you will violate your part of the bargain, then no true agreement can be reached. No contracts can be made with animals since animals cannot understand an agreement. Most significantly, I cannot contract to give up my right to self-defense since self-defense (or self-preservation) is my sole motive for entering into any contract.

OTHER LAWS OF NATURE. Hobbes derives his laws of nature deductively, modeled after the type reasoning used in geometry. That is, from a set of general principles, more specific principles are logically derived. Hobbes's general principles are (1) that people pursue only their own self-interest, (2) the equality of people, (3) the causes of quarrel, (4) the natural condition of war,

and (5) the motivations for peace. From these he derives the above two laws, along with at least 13 others. Simply making contracts will not in and of itself secure peace. We also need to keep the contracts we make, and this is Hobbes's third law of nature. Hobbes notes a fundamental problem underlying all contracts: as selfish people, each of us will have an incentive to violate a contract when it serves our best interests. For example, it is in the mutual best interests of Jones and myself to agree to not steal from each other. However, it is also in my best interests to break this contract and steal from Jones if I can get away with it. And, what complicates matters more, Jones is also aware of this fact. Thus, it seems that no contract can ever get off the ground. This is accomplished by giving unlimited power to a political sovereign who will punish us if we violate our contracts. Again, it is for purely selfish reasons (i.e. ending the state of nature) that I agree to set up a policing power which will punish me.

As noted, Hobbes's first three Laws of Nature establish the overall framework for putting an end to the state of nature. The remaining laws give content to the earlier ones by describing more precisely the kinds of contracts which will preserve peace. For example, the fourth law is to show Gratitude toward those who comply with contracts. Otherwise people will regret that they complied when someone is ungrateful. Similarly, the fifth law is that we should be accommodating to the interests of society. For, if we quarrel over every minor issue, then this will interrupt the peace process. Briefly, here are the remaining laws: (6) cautious pardoning of those who commit past offenses; (7) the purpose of punishment is to correct the offender, not "an eye for an eye" retribution; (8) avoid direct or indirect signs of hatred or contempt of another; (9) avoid pride; (10) retain only those rights which you would acknowledge in others; (11) be equitable (impartial); (12) share in common that which cannot be divided, such as rivers; (13) items which cannot be divided or enjoyed in common should be assigned by lot; (14) mediators of peace should have safe conduct; (15) Resolve disputes through an arbitrator. Hobbes explains that there are other possible laws which are less important, such as those against drunkenness, which tends to the destruction of particular people. At the close of Chapter 15 Hobbes states that morality consists entirely of these Laws of Nature which are arrived at though social contract. Contrary to Aristotle's account of virtue ethics, Hobbes adds that moral virtues are relevant to ethical theory only insofar as they promote peace. Outside of this function, virtues have no moral significance.

GOVERNMENTS. Hobbes continues in Chapter 17 that to ensure contracts (and peace) power must be given to one person, or one assembly. We do this by saying, implicitly or explicitly, "I authorize and give up my right of governing myself, to this person, or to this assembly of people, on this condition, that thou give up thy right to him, and authorize all his actions in like manner." His definition of a commonwealth, then, is this: "One person, of whose acts a great multitude, by mutual covenants on with another, have mad themselves every on the author, to the end he may use the strength and means of them all, as he shall think expedient, for their peace and common defense" This person is called a "sovereign." He continues that there are two ways of establishing a commonwealth: through acquisition (force), or through institution (agreement). In Chapter 18 Hobbes lists the rights of rights of sovereigns. They are, (1) Subjects owe him sole loyalty; (2) Subjects cannot be freed from their obligation; (3) Dissenters must consent with the majority in declaring a sovereign; (4) Sovereign cannot be unjust or injure any subject; (5) The sovereign cannot be put to death; (6) The right to censor doctrines repugnant to peace; (7) Legislative power of prescribing rules; (8) Judicial power of deciding all controversies; (9) Make war and peace with other nations; (10) Choose counselors; (11) Power of reward and punishment; (12) Power of all civil appointments, including the militia. In Chapter 19 he discusses the kinds of governments that

can be instituted. The three main forms are monarchy, aristocracy and democracy. He argues that monarchy is best for several reasons. Monarch's interests are the same as the people's. He will receive better counsel since he can select experts and get advice in private. His policies will be more consistent. Finally, there is less chance of a civil war since the monarch cannot disagree with himself.

Shadworth Hodgson (1832-1912)

Shadworth Hodgson's life was an example of rare devotion to philosophy. He had no profession and filled no public office, but spent his time in systematic reflection and writing; and his long life gave him the opportunity of reviewing, confirming, and improving upon his first thoughts. There were two periods in his activity. In the former of these he published three books: *Time and Space* in 1865, *The Theory of Practice* in 1870, and *The Philosophy of Reflection* in 1878. Shortly thereafter he was instrumental in founding 'the Aristotelian Society for the systematic study of philosophy,' and he remained its president for fourteen years. This led to contact with other minds who looked at the same subjects from different points of view. He read many papers to the society, which were published in pamphlet form and in its *Proceedings*, and he built up his own system afresh in the light of familiar criticism. It took final form in *The Metaphysic of Experience*, a work of four volumes published in 1898.

As an analysis of experience, Hodgson's philosophy falls into line with a characteristic English tradition. It agrees with this tradition also in taking the simple feeling as the ultimate datum of experience. But, even here, and wherever there is experience, there is a distinction to be drawn--not the traditional distinction between subject and object, but that between consciousness and its object. There are always two aspects in any bit of experience--that of the object itself or the objective aspect, and that of the awareness of it or the subjective aspect; and these two are connected by the relation of knowledge. The sciences are concerned with the objective aspect only; philosophy has to deal with the subjective aspect, or the conscious process which is fundamental and common to all the various objects. Beyond this conscious reference there is nothing. The *mirage* of absolute existence, wholly apart from knowledge, is a common-sense prejudice. Consciousness is commensurate with being; all existence has a subjective aspect. But this doctrine, he holds, is misinterpreted when mind and body are supposed to interact or when mental and bodily facts are regarded as parallel aspects of the same substance. In psychology Hodgson may be called a materialist, unfit as that name would be to describe his final philosophical attitude. Ideas do not determine one another, nor does desire cause volition; the only real condition known to us is matter. And yet matter itself is a composite existence; it can be analyzed into empirical precepts; and therefore it is itself conditioned by something which is not material: the very term *existence* implies relativity to some sort of consciousness or other. This is the conclusion of the general analysis of experience. Of the unseen world which lies beyond the material part of the world we cannot, he contends, have any speculative knowledge. But the ethical judgment and our own moral nature bring us into practical relation with that unseen world and thus permit a positive, although not a speculative, knowledge of it. In this way, in the final issue of his philosophy as well as in its fundamental positions, Hodgson regards himself as correcting and completing the work of Kant.

Humanism

The exact point in time when the term "Humanism" was first adopted is unknown. It is, however, certain that Italy and the re-adopting of Latin letters as the staple of human culture were responsible for the name of Humanists. *Literoe humaniores* was an expression coined in reference to the classic literature of Rome and the imitation and reproduction of its literary forms in the new learning; this was in contrast to and against the *Literoe sacroe* of scholasticism. In the time of Ario sto, Erasmus, and Luther's beginnings, the term *umanisa* was in effect an equivalent to the terms "classicist " or " classical scholar."

ITALIAN HUMANISM. Dante had an admiration for ancient letters. At first, he intended to compose his great epic in Latin verse. Petrarch considered his *Africa* a fair effort to reproduce *Vergil*. In the exordium of his chief work Petrarc h appeals to the Heliconian Sisters as well as to Jesus Christ, Savior of the world. He also reviews the epics of Homer (although he never learned Greek), Statius, and Lucan. He was overwhelmed with the friendships of many prestigous men of his day, a mong whom Cardinal Stephen Colonna was prominent. Petrarch is the pathfinder as well as the measure of the new movement. He idealized the classical world. His classicist consciousness and his Christian consciousness are revealed in his writings. Th e experiences of life constantly evoke in him classic parallels, reminiscences, associations. Julius Caesar, Papirius Cursor, are *nostri*, "our people"; Pyrrhus, Hannibal, Massinissa are *externi*, "foreigners." His epistles provide the b est revelation of his soul. Of course, the craving for pure Latinity and the elevation of such practical power of imitation and reproduction involved an artificiality of which neither Petrarch nor his successors were aware. Boccaccio was not only a hu manist, but he, with appalling directness, revealed the emancipation of the flesh as one of the unmistakable trends of the new movement. Both he and Poggio, Valla, Beccadelli, Enea Silvio dei Piccolomini (in his youth) show that the hatred of the cle rical class instigated literary composition. At the same time in the caricatures of foulness which these leaders of the new learning loved to draw, there is no moral indignation, but clearly like satyrs they themselves relish these things. For this reason the Humanists of Italy, as such, were not at all concerned in the efforts for a reformation of the church as attempted in the councils of Constance or of Basel. Poggio, apostolic secretary, came to Constance with the corrupt pope John XXIII., bu t spent most of his time in ransacking the libraries of Swiss monasteries for Latin codices. The defense of Jerome of Prague before the Council reminded him of Cato of Utica. His correspondent Lionardo Bruni at Florence warns him to be more circumsp ect in his praise of a heretic. In the Curia itself a semipagan spirit was bred by the Humanists. In 1447 Parentucelli, an enthusiast for codices, became pope as Nicholas V. On Easter, the eminent humanist Filelfo wrote to him from Milan to congratul ate him on his elevation. Filelfo expressed a general satisfaction of scholars, citing also the *humanitas* of Christ himself, as well as writing somewhat hypocritically of *fucata gentilium . . . sapientia*. Some time later, in 1453, Filel fo personally appeared at the papal court. Nicholas kept the vile "Satyrae" of the humanist until he had perused them, and gave Filelfo a purse of 500 ducats when he departed.

Enea Silvio de' Piccolomini ascended the papal throne in 1458 as Pius II., another humanist pope.

CHARACTER OF THE MOVEMENT. A very clear view of the Humanistic movement may be gained from the writings of the biographer and beneficiary of Leo X., Paul Giovio (Jovius). In his *Elogia* (Antwerp,1557) he presents a gallery of literary scholar s, beginning with Dante, and including Petrarch, Boccaccio, Bruni, Poggo, Beceadelli (the pornographic poet), Valla, Filelfo, Platina, the Greeks Emanuel Chrysoloras, Cardinal Bessarion, Trapezuntius the Cretan, Theodorus Gaza, Argyropulos, Chalcondyla s, Musurus of Crete, and Lasearis. Also, he gives us Lorenzo de'Medici, Ermolao Barbaro, Politian, Pico di Mirandola, and even Savonarola. But Savonarola's attacks on Pope Alexander VI., father of Cesare and Lucrezia, are treated as treason and felon y. The Platonic academy of Ficinus at Florence had certainly no power to regenerate the political and moral corruption of its patron Lorenzo. Bibienna, the favorite of Leo X., was witty at banquets; at Leo's court this cardinal produced his lascivio us comedy, "Colandra," because Terence was too grave. Even Thomas More and Reuchlin are included. Among the latter's academic friends were the anonymous composers of the satiric *Epistoloe obscurorum virorum*-the flail of the new learning swung ag ainst the old. The Italian Humanists were not concerned in the reformatory movements of the fifteenth century. They drifted into a palpable paganism or semipaganism, curiously illustrated in the verse, e.g., of Politian, especially his Greek verse, a nd of him even the lax Giovio writes: "he was a man of unseemly morals. "They all more or less emphasized "*vera virtus*" by which they meant "true excellence," the self-wrought development of human faculties and powers. Still they knew how to ma intain friendly relations with those higher clerics who had resources with which to patronize the new learning. They often accepted clerical preferment, as did Gievio, who became bishop of Nocera. Often the Latin verse of their youth proved very awkw ard when they entered upon their benefices. All were more interested "in viewing the early monuments of sensual enjoyment" than in study of the New Testament. As they greatly exceeded the corruption of the clergy in their own conduct, they could not take any practical interest in any spiritual or theological reformation. In all the correspondence of Filelfo, extending from 1428 to 1462, there is but once or twice a slight (deistic) utterance of spiritual concern, when, in the siege of Milan by Fr ancesco Sforza, 1449, the ducal city endured terrible sufferings. Jacob Burckhardt says of the Humanists that they were demoralized by their reproduction of Latin verse. But why did they delve in Ovid, Catullus, and the like with steady predilection? A t best a mild deism or pantheism may be perceived in their more serious writings. Greek, on the whole, was a rare attainment among them, reproductive ostentation limited most of them to Latin.

ERASMUS. Erasmus of Rotterdam in his person and career marks the point where the "new learning" had arrived at the parting of the ways. He felt an affinity for Lucian; his *Encomium Morioe*, a vitriolic satire, dealt not gently with clerical corruption. He edited the New Testament and dedicated it to Leo X. He had no desire to abandon the old Church, considering the bounties and pensions which he received were all derived from princes or clerics who adhered to the papacy. He pretended th at he could not read the German writings of Luther. Erasmus wrote that "Luther's movement was not connected with learning," and, at the same time he wrote to Pope Hadrian VI.: "I could find a hundred passages where St. Paul seems to teach the doctri nes which they condemn in Luther. "Other utterances show his unwillingness to serve the Reformation or to be held responsible for any part of it: I have written nothing which can be laid hold of against the established orders. . . . I would rather see things left as they are than to see a revolution which may lead to one knows not what. Others may be martyrs, if they like. I aspire to no such honor. . . . I

care nothing what is done to Luther, but I care for peace. . . . If you must take a s ide, take the side which is most in favor." His keen sense of actual dependencies in the movement of things led him to see situations and realities with wonderful clearness; but his genius, like that of many scholars, was essentially negative. When he was fifty-one, not long before 1517, he wrote to Fabricius at Basel: "My chief fear is that with the revival of Greek literature there may be a revival of paganism. There are Christians who are Christians but in name, and are Gentiles at heart." In the fall of 1525, when central Germany had been affected by the Peasants' War, he wrote: "You remember Reuchlin. The conflict was raging between the Muses and their enemies, when up sprang Luther, and the object thenceforward was to entangle the f riends of literature in the Lutheran business, so as to destroy both them and him together."

David Hume (1711-1776)

LIFE AND WRITINGS. David Hume was born in 1711 to a moderately wealthy family from Berwickshire Scotland, near Edinburgh. His background was politically Whiggish and religiously Calvinistic. As a child he faithfully attended the local Church of Scotland pastored by his uncle. Hume was educated by his widowed mother until he left for the University of Edinburgh at the age of eleven. His letters describe how as a young student he took religion seriously and obediently followed a list of moral guidelines taken from *The Whole Duty of Man*, a popular Calvinistic devotional.

Leaving the University of Edinburgh at around age fifteen to pursue his education privately, he was encouraged to consider a career in law, but his interests turned to philosophy. During these years of private study he began raising serious questions about religion, as he recounts in the following letter:

> **Tis not long ago that I burn'd an old Manuscript Book, wrote before I was twenty; which contain'd, Page after Page, the gradual Progress of my Thoughts on that head [i.e. religious belief]. It begun with an anxious Search after Arguments, to confirm the common Opinion: Doubts stole in, dissipated, return'd, were again dissipated, return'd again.**

Although his manuscript book was destroyed, several pages of Hume's study notes survive from his early twenties. These show a preoccupation with the subjects of proof of God's existence and atheism, particularly as he read on these topics in classical Greek and Latin texts and in Pierre Bayle's skeptical *Historical and Critical Dictionary*. During these years of private study, some of which was in France, Hume composed his three-volume *Treatise of Human Nature*, which was published anonymously in two installments before he was thirty (1739, 1740). The *Treatise* explores several philosophical topics such as space, time, causality, external objects, the passions, free will, and morality, offering original and often skeptical appraisals of these notions. Although religious belief is not the subject of any specific section of the *Treatise*, it is a recurring theme. Book I of the *Treatise* was unfavorably reviewed in the *History of the Works of the Learned* with a succession of sarcastic comments. Although scholars today recognize it as a philosophical masterpiece, Hume was disappointed with the minimal interest his book spawned.

In 1741 and 1742 Hume published his two-volume *Essays, Moral and Political*. The essays were written in a popular style and met with better success than the *Treatise*. In 1744-1745 Hume was a candidate for the Chair of Moral Philosophy at the University of Edinburgh. The position was to be vacated by John Pringle, and the leading candidates were Hume and William Cleghorn. The Edinburgh Town Council was responsible for electing a replacement. Critics opposed Hume by condemning his anti-religious writings. Chief among the critics was clergyman William Wishart (d. 1752), the Principal of the University of Edinburgh. Lists of allegedly dangerous propositions from Hume's Treatise circulated, presumably penned by Wishart. In the face of such strong opposition, the Edinburgh Town Council consulted the Edinburgh ministers. Hoping to win over the clergy, Hume composed a point by point reply to the circulating lists of dangerous propositions. It was

published as *A Letter from a Gentleman to his Friend in Edinburgh*. The clergy were not dissuaded, and 12 of the 15 ministers voted against Hume. Hume quickly withdrew his candidacy. In 1745 Hume accepted an invitation from General St Clair to attend him as secretary. He wore the uniform of an officer, and accompanied the general on an expedition against Canada (which ended in an incursion on the coast of France) and to an embassy post in the courts of Vienna and Turin.

In 1748 he added to the above collection an essay titled "Of National Characters." In a lengthy footnote to this piece, Hume attacks the character of the clergy, accusing this profession of being motivated by ambition, conceit, and revenge. This footnote became a favorite target of attack by the clergy. Given the success of his *Essays*, Hume was convinced that the poor reception of his *Treatise* was caused by its style rather than by its content. In 1748 he published his *Enquiry Concerning Human Understanding*, a more popular rendition of Book I of his *Treatise*. The *Enquiry* also includes two sections not found in the *Treatise* and which contain fairly direct attacks on religious belief: "Of Miracles" and a dialogue titled "Of a Particular Providence and of a Future State."

In 1751 Hume published his *Enquiry concerning the Principles of Morals*, which recasts in a very different form parts of Book III of his *Treatise*. Although this work does not attack religion directly, it does so indirectly by establishing a system of morality on utility and human sentiments alone, and without appeal to divine moral commands. Critics such as James Balfour criticized Hume's theory for being Godless. However, by the end of the century Hume was recognized as the founder of the moral theory of utility. Utilitarian political theorist Jeremy Bentham acknowledges Hume's direct influence upon him. The same year Hume also published his *Political Discourses*, which drew immediate praise and influenced economic thinkers such as Adam Smith, Godwin, and Thomas Malthus.

In 1751-1752 Hume sought a philosophy chair at the University of Glasgow, and was again unsuccessful. In 1752 Hume's employment as librarian of the Advocate's Library in Edinburgh provided him with the resources to pursue his interest in history. There he wrote much of his highly successful six-volume *History of England* (published from 1754 to 1762). The first volume was unfavorably received, partially for its defense of Charles I, and partially for two sections which attack Christianity. In one passage Hume notes that the first Protestant reformers were fanatical or "inflamed with the highest *enthusiasm*" in their opposition to Roman Catholic domination. In the second passage he labels Roman Catholicism a superstition which "like all other species of superstition... rouses the vain fears of unhappy mortals." The most vocal attack against Hume's *History* came from Daniel MacQueen in his 300 page *Letters on Mr. Hume's History*. MacQueen combs through Hume's first volume of the *History*, exposing all the allegedly "loose and irreligious sneers" Hume makes against Christianity. Ultimately, this negative response led Hume to delete the two controversial passages from succeeding editions of the *History*.

At about this time Hume also wrote his two most substantial works on religion: *The Dialogues Concerning Natural Religion* and *The Natural History of Religion*. The *Natural History* appeared in 1757, but, on the advice of friends who wished to steer Hume away from religious controversy, the *Dialogues* remained unpublished until 1779, three years after his death. The *Natural History* aroused controversy even before it was made public. In 1756 a volume of Hume's essays titled *Five Dissertations* was printed and ready for distribution. The essays included (1) "The Natural History of Religion," (2) "Of the Passions," (3) "Of Tragedy," (4) "Of Suicide," and (5) "Of the Immortality of the Soul." The latter two essays made direct attacks on common religious doctrines by defending a person's moral right to commit suicide and by criticizing the idea of life after death.

Early copies were passed around, and someone of influence threatened to prosecute Hume's publisher if the book was distributed as is. The printed copies of *Five Dissertations* were then physically altered, with a new essay "Of the Standard of Taste" inserted in place of the two removed essays. Hume also took this opportunity to alter two particularly offending paragraphs in the *Natural History*. The essays were then bound with the new title *Four Dissertations* and distributed in January, 1757.

In the years following *Four Dissertations*, Hume completed his last major literary work, *The History of England*. In 1763, at age 50, Hume was invited to accompany the Earl of Hertford to the embassy to Paris, with a near prospect of being his secretary. He eventually accepted, and remarks at the reception he received in Paris "from men and women of all ranks and stations." returned to Edinburgh in 1766. Among these was Jean Jacques Rousseau who in 1766 was ordered out of Switzerland by the government in Berne. Hume offered Rousseau refuge in England and secured him a government pension. In England, Rousseau became suspicious of plots, and publicly charged Hume with conspiring to ruin his character, under the appearance of helping him. Hume published a pamphlet defending his actions and was exonerated. Another secretary appointment took him away from 1767-1768. Returning again to Edinburgh, his remaining years were spent revising and refining his published works, and socializing with friends in Edinburgh's intellectual circles. In 1776, at age 65, he died from an internal disorder which had plagued him for many months.

After his death, Hume's name took on new significance as several of his previously unpublished works appeared. The first was a brief autobiography, *My Own Life*, which many have praised as the best short autobiography in English. Even this unpretentious work aroused religious controversy. As Hume's friends, Adam Smith and S.J. Pratt, published affectionate eulogies describing how he died with no concern for an afterlife, religious critics responded by condemning this unjustifiable admiration of Hume's infidelity. Two years later, in 1779, Hume's *Dialogues* appeared. Again, the response was mixed. Admirers of Hume considered it a masterfully written work, while religious critics branded it as dangerous to religion. Finally, in 1782, Hume's two suppressed essays on suicide and immortality were published. Their reception was almost unanimously negative.

The Internet Encyclopedia of Philosophy

Edmund Husserl (1859-1938)

Edmund Husserl, a leader of the German phenomenological movement, taught at Göttingen from 1901 until 1916, and then at Freiburg im Breisgau from 1916 to 1928. This article presents (A) his biography; (B) various strategies for interpreting his phenomenology; and (c) a survey of his major works.

BIOGRAPHY. Edmund Husserl was born April 8, 1859, into a Jewish family in the town of Prossnitz in Moravia, then a part of the Austrian Empire. Although there was a Jewish technical school in the town, Edmund's father, a clothing merchant, had the means and the inclination to send the boy away to Vienna at the age of 10 to begin his German classical education in the Realgymnasium of the capital. A year later, in 1870, Edmund transferred to the Staatsgymnasium in Olmütz, closer to home. He was remembered there as a mediocre student who nevertheless loved mathematics and science, "of blond and pale complexion, but of good appetite." He graduated in 1876 and went to Leipzig for university studies.

At Leipzig Husserl studied mathematics, physics, and philosophy, and he was particularly intrigued with astronomy and optics. After two years he went to Berlin in 1878 for further studies in mathematics. He completed that work in Vienna, 1881-83, and received the doctorate with a dissertation on the theory of the calculus of variations. He was 24. Husserl briefly held an academic post in Berlin, then returned again to Vienna in 1884 and was able to attend Franz Brentano's lectures in philosophy.

In 1886 he went to Halle, where he studied psychology and wrote his Habilitationsschrift on the concept of number. He also was baptized. The next year he became Privatdozent at Halle and married a woman from the Prossnitz Jewish community, Malvine Charlotte Steinscheider, who was baptized before the wedding. The couple had three children. They remained at Halle until 1901, and Husserl wrote his important early books there. The Habilitationsschrift was reworked into the first part of *Philosophie der Arithmetik*, published in 1891. The two volumes of *Logische Untersuchungen* came out in 1900 and 1901.

In 1901 Husserl joined the faculty at Göttingen, where he taught for 16 years and where he worked out the definitive formulations of his phenomenology that are presented in *Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie (Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy)*. The first volume of *Ideen* appeared in the first volume of Husserl's *Jahrbuch für Philosophie und phänomenologische Forschung* in 1913. Then the world war disrupted the circle of Husserl's younger colleagues, and Wolfgang Husserl, his son, died at Verdun. Husserl observed a year of mourning and kept silence professionally during that time.

However Husserl accepted appointment in 1916 to a professorship at Freiburg im Breisgau, a position from which he would retire in 1928. At Freiburg Husserl continued to work on manuscripts that would be published after his death as volumes two and three of the *Ideen*, as well as on many other projects. His retirement from teaching in 1928 did not slow the pace of his

phenomenological research. But his last years were saddened by the escalation of National Socialism's racist policies against Jews. He died of pleurisy in 1938, on Good Friday, reportedly as a Christian.

Most commentators, therefore, recognize three periods in Husserl's career: the work at Halle, Göttingen, and Freiburg, respectively. Some argue that one or another of these periods ought to be taken as definitive and used as the interpretive key to unlock the others. But such an approach highlights disjunctions in Husserl's thought while neglecting the significant continuities. Important strands of Husserl's philosophy have their beginning long before his academic career commenced.

The community into which Husserl was born, Prossnitz, was a center of talmudic learning whose yeshiva had produced or welcomed a number of famous rabbis during the two centuries before Husserl's birth. This scholarly activity was supported by the industries of textile and clothing manufacture, through which Prossnitz's Jews had enhanced the prosperity of the region. Jews and Germans were minorities in the town and appear to have comprised its middle class. Their interests were naturally allied against those of the Slavic majority. (For example, the census of 1900 counted 1,680 Jews among the town's 24,000 inhabitants, according to *The Jewish Encyclopedia*.) In the ethnically diverse town, several dialects were spoken, and the language of the Husserl home probably was Yiddish.

The Jewish community of Prossnitz had established a technical school in 1843, and it became a public school for all the town's children in 1869--one year before young Edmund Husserl was sent off to Vienna's Realgymnasium. 1868 was also a year when civic authorities called for reform of Jewish education at all levels throughout Moravia. These developments reflect a movement toward modernization and integration after centuries of enforced segregation and legal restriction of Jewish life.

Prossnitz was the second-largest Jewish community in Moravia, with 328 families. *Exactly* 328 families; it could have no more, because of the quota established by the Bohemian *Familianten Gesetz* in 1787. The Jewish population was controlled through marriage licenses. Civil law set specific economic, age, and educational requirements; but in addition, the license could be granted only after a death freed up one of the allotted 328 slots. In effect, only first sons could hope to marry. Others had to emigrate if they wanted to have families of their own. This population-control policy was enforced until 1849, ten years before Edmund Husserl's birth. The requirement that Jews obtain special marriage licenses remained in effect until late in 1859, some months after Edmund's birth.

But Edmund Husserl's childhood was spent during an era of liberalization for Prossnitz's Jews. He received an elite secular education and probably made his father quite proud. At that period, gymnasia provided separate religious instruction for Christian boys and Jewish boys. Edmund's Jewish education would have continued in that context and in the language of secular culture, High German. He could hear and read the Bible in that modern language as well, for in the nineteenth century a wave of new translations into the language of German culture was spawned by Moses Mendelssohn's groundbreaking work. (Mendelssohn's 1783 translation into High German was printed in Hebrew characters, phonetically, to make it easy to read.) Some of these editions were lavishly illustrated for display in bourgeois homes like Edmund's, and most took into account the findings of recent historical and philological science. But during Edmund's childhood, translating the Hebrew Bible was still a controversial issue. Some educational leaders in the Jewish community warned that it would undermine Hebrew learning among the young. Hebrew learning was

evidently not prized by a father who would send his son to the capital to study Greek and Latin at the age when boys traditionally were sent down the street to learn Hebrew and Torah. To complicate the picture, in 1870 when Edmund was eleven, a new rabbi came to serve the Prossnitz community.

One may surmise, then, that Edmund Husserl came by his knowledge of the Bible through his classical secular education, not his religious tradition. It was of a piece with the German cultural heritage for him. It was a source of literary allusions, and in later life he could compare himself to Moses and to Sisyphus with equal ease.

Literary allusions, along with fragments of correspondence, are all that remain to us for the reconstruction of what Husserl may have felt about himself and his work. There is no autobiography *per se*. But there are retrospective texts. One of the most illuminating is the brief introduction that Husserl prepared for the 1931 publication in English of the first book of *Ideen*, originally brought out in 1913.

Now in his seventies, Husserl complains that most readers have misunderstood his life's work. When he undertakes to reformulate what phenomenology is and what he has accomplished, however, he writes from a vantage point that he did not have some two decades earlier. Husserl becomes, in effect, a critic and interpreter of his own work, which he describes with a sustained metaphor. He portrays himself as an explorer who has opened the way into new territory so that others may conquer, map, and farm it. Of himself, Husserl writes:

> "(H)e who for decades did not speculate about a new Atlantis but instead actually journeyed in the trackless wilderness of a new continent and undertook the virgin cultivation of some of its areas will not allow himself to be deterred in any way by the rejection of geographers who judge his reports according to their habitual ways of experiencing and thinking and thereby excuse themselves from the pain of undertaking travels in the new land" (422)

Here is another example of this characterization:

> I can see spread out before me the endlessly open plains of true philosophy, the 'promised land', though its thorough cultivation will come after me" (429)

By means of this spatial, geographical metaphor of crossing over into the "new land," Husserl conveys something of the adventure and pioneer courage that should accompany phenomenological work. This science is related to "a new field of experience, exclusively its own, the field of 'transcendental subjectivity'," and it offers "a method of access to the transcendental-phenomenological sphere" (408). Husserl is the "first explorer" (419) of this marvelous place.

HOW TO INTERPRET HUSSERL'S TEXTS. Husserl had already employed the spatial metaphor in the 1913 text, although without explicit reference to himself as explorer. In chapter I-1 of *Ideen I* he had distinguished states of affairs (*Sachverhaltnis*) from essences (*Wesen*) by assigning them to two "spheres": the factual or material, and the formal or eidetic, respectively. These spheres are connected only by the mind's ability to pass *between* them as easily as moving around *within* either of them; they do not connect on their own, as it were. That is, no causality obtains between them. "Movement between" and "movement within" are of course further elaborations upon the spatial metaphor, and serve to designate the ability of consciousness to flow along, concentrate itself, linger, combine, focus, or disperse as it will. Such acts of consciousness belong to these spheres. They are worldly. They are "psychological."

Husserl's task is to get *from* those spheres *into* another "field" that is quite unlike them. It will be the sphere of absolute consciousness, consciousness when it isn't going anywhere. As the title of chapter II-3 puts it, this will be "The Region of Pure Consciousness." You can't "go there" with consciousness; instead you have to let the worldly go away and then inhabit what's left. This is the import of the infamous fantasy that opens paragraph 33: "*(W)as kann als Sein noch setzbar sein, wenn das Weltall, das All der Realität eingeklammert bleibt?*" (In Kersten's paraphrase: "What can remain, if the whole world, including ourselves with all our *cogitare*, is excluded?" [63])

Now, it's quite curious that Husserl should choose the spatial metaphor to introduce and induce his phenomenological reduction. This metaphor invites confusion for anyone familiar with Descartes--who after all named spatial extension as the substantial attribute of material being. None of Husserl's "spheres" is literally extended, in the Cartesian sense; yet all are coextensive (coincident) with material being--inasmuch as there's literally *nowhere else* besides the material universe where they could be. Why then should Husserl choose such an incongruous and counterproductive metaphor? A different metaphor (such as "fabric" or "organism," for example) could have conveyed the notions of coherence, separation, and access that Husserl intended. What is distinctive about the spatial metaphor, however, is that it connotes exploration and conquest. If transcendental consciousness is a promised land, then you need a Moses to lead you toward it. You need Husserl. When Husserl remarks, in the 1931 Introduction, that he can look down across that land that he has discovered, but that others will enter, this is a literary allusion to the figure of Moses, who led his people to Canaan, "the promised land," but did not lead them into it (Deuteronomy 34).

If these allusions from 1931 can be taken as a thumbnail self- portrait, still one must remember that it was sketched during Husserl's retirement. But Husserl's thought grew and changed throughout his long career. In his maturity, the philosopher joined his readers in producing commentary upon his youthful work. The three phases of Husserl's career--Halle, Göttingen, and Freiburg--invite facile divisions, and decisive turning points have been suggested within each of those periods. (The survival of nearly 45,000 pages of stenographic notes from Husserl's teaching and his private researches has fueled disputes about when he might have had the first glimmer of a thought that led to a lecture comment that led to a paragraph that found its way into a book published long after the man's papers and ashes were shelved in Louvain!)

Husserl himself insisted that the threads of continuity throughout the evolution of his thought were more significant than any false starts that later had to be repudiated. It seems well to grant him this point. Yet on two issues one must take seriously the critical discussion arising from disjunctions in Husserl's thought: (a) the question whether to characterize Husserl as realist or idealist, and (b) the question of which stage of Husserl's evolution--if any--should be taken as the definitive version through which all other versions are to be read. Husserl himself, writing as his own critic later in life, took a position on each of those issues. On (a), he insisted that he was and always had meant to be a transcendental idealist. On (b), he claimed competence to correct the insights of 1887, 1900, and 1913 with the insights of the 1920's and 1930's. Thus the mature Husserl would wish to erase the impression that his early work resolved the realism-idealism conundrum in favor of realism, and that it did so in fidelity to an insight already expressed in his earliest work on number.

Various punctuations of Husserl's career by time, place, and predominant question have been suggested by commentators (for example, Kockelmans 1967: 17-23; Ricoeur 1967: 3-12; Biemel 1970; and Bell 1990). Husserl's phenomenology developed gradually, but there were several

relatively sudden turns and several stalls. Two examples suffice to illustrate. While at Halle shortly after the publication of *Philosophie der Arithmetik*, Husserl distanced himself from his recent efforts to establish mathematical and logical principles upon the psychological operations of the mind--a project that he later termed "psychologism." Many commentators have characterized this as an abrupt turn made in response to Frege's effective criticism of *Philosophie der Arithmetik*. However Mohanty (1982: 13), who examines the Frege-Husserl correspondence along with other documentary evidence, concludes to the contrary, that:

> the seeds of development of Husserl's philosophy from the *Philosophie der Arithmetik* to the *Prolegomena* [i.e., the first volume of the *Logische Untersuchungen*, 1900] were immanent to his own thinking, so that the hypothesis of a traumatic effect of Frege's 1894 review of his book and a consequent reversal of his mode of thinking is not only uncalled for but also unsubstantiated by the available evidence.

Mohanty, then, provides ample warrant for a reading of Husserl that pursues threads of continuity between his early mathematical work and the breakthrough to phenomenology while at Halle.

In a second example of a supposed disjuncture in Husserl's development, there has been discussion of whether he changed his stance from realism to idealism between Göttingen and Freiburg. On the one hand, Eugen Fink (1933) and many others see a consistent evolution of transcendental idealism from the work published in *Ideen I* onward. They tend either to dismiss the earlier works as if they were merely youthful failures, or forcibly to harmonize the realist passages with Husserl's later positions. Husserl himself endorsed such a reading. On the other hand, those who studied with Husserl at Göttingen insist that his work at that time had validity and integrity in its own right. His former student Edith Stein (1932: 44-45) remarks that Husserl's disciples were surprised at the idealistic passages in *Ideen*, and she calls Fink a latecomer to Husserl's phenomenology. One of Stein's contemporaries among Husserl students, Roman Ingarden (1962: 159), says that:

> the idealistic tendencies apparent in volume I of the *Ideen* had been opposed by his disciples when the work was being studied during the seminars at Göttingen and . . . his disciples pointed out many passages in the *Ideen* which seemed to contain direct arguments against his idealism.

Subsequently Ingarden presented arguments, based on both the text of *Logische Untersuchungen* and his conversations with Husserl, in support of the view that Husserl originally espoused a realist standpoint but later abandoned it (Ingarden 1975: 4-8). Further discussion of the issue is to be found in Kockelmans (1967: 418-449) and in Van de Pitte (1981: 36-42)--who suggests that the discrepancy will vanish if one reads Husserl's idealism as an epistemological or methodological approach to a metaphysically real world.

For his own part, Husserl (1931: 418-9) claimed that his transcendental idealism had advanced altogether beyond ordinary idealism, beyond realism, and beyond the very distinction between them. He denied that he ever had held a realist position:

> . . . I still consider, as I did before, every form of the usual philosophical realism nonsensical in principle, no less so than that idealism which it sets itself up against in its arguments and which it "refutes." [Phenomenological reduction] is a piece of pure self- reflection, exhibiting the most original evident facts; moreover, if it brings into view in them the outlines of idealism . .. it is still anything but a party to the usual debates bewteen idealism and realism. . . .

Husserl argued that transcendental-phenomenological idealism did not deny the actual existence of the real world, but sought instead to clarify the *sense* of this world (which everyone accepts) *as actually existing*.

Thus Husserl joins the company of those who read his work "backwards," from the standpoint of Freiburg, interpreting the earliest work in light of the transcendental idealism of the latest. This reading grants no validity to the earlier work in its own right. It sets Husserl against Kant, and phenomenology's thoroughgoing idealism against Kantian critical idealism. Fink, in his detailed response to neo- Kantians' readings of Husserl's phenomenology (1932), scolds them for even addressing arguments made in Husserl's 1900-1 and 1913 publications--for Fink contends that those positions now must be assimilated to Husserl's later formulations. The extreme hermeneutical implications of this stance come clear in Fink's delineation of the threefold paradox entailed in reading Husserl's phenomenology: (1) It is inevitably misunderstood if the reader has not first cultivated the transcendental attitude; yet that attitude arises from the reading. (2) The words necessarily miss their meaning, and fail to refer effectively to the pre-worldly realm of transcendental subjectivity, since all available words are worldly. (3) Phenomenology goes to a realm beyond logic, individuation, and determination, which ordinarily structure understanding. In this extreme form, then, the Freiburg reading of Husserl's work is a locked door for the newcomer who is trying to get acquainted with Husserl's phenomenology.

Fortunately, there are other hermeneutical options. A second group of commentators read Husserl "forward" from his intellectual beginnings at Vienna and Halle. The early work in mathematics and logic continues to attract the interest of Analytic philosophers. They are among those who argue that Husserl's concern with numbers and logical reasoning, stimulated by the Kantian challenge, fructified in the prescription of eidetic and, eventually, phenomenological reductions.

Besides reading Husserl from Halle "forward" or from Freiburg "backward," there is yet a third option. One may base one's reading upon the Göttingen period and upon questions involving the genesis of the *Ideen*, as the keystone in the arch of Husserl's development. This is the stance suggested by Ingarden, who considered Husserl's later transcendentalism a big mistake, and by Stein, whose own subsequent works unfold the implications of the realism and personalism embraced by Husserl at that period. On this view the world, lost by Kant, is won back for science.

The problems of oneness and unity occupied Husserl throughout all the phases of his philosophical development: his earliest work on number and logic, his pre-war realist descriptive phenomenology, and his idealist transcendental phenomenology. His philosophy in some respects parallels the emergence of modern psychology, with whose tenets it should not be confused. The following are his major works.

"ÜBER DEN BEGRIFF DER ZAHL" ("ON THE CONCEPT OF NUMBER," 1887). Husserl's Habilitationsschrift is subtitled "psychological analyses," and it addresses the question how we recognize manyness within a group. Husserl remarks that the common definition of number--that number is a multiplicity of units--leaves two key questions unanswered: "What is 'multiplicity'? And what is 'unity'?" It is the former question, multiplicity, that occupies his attention throughout the essay. However the latter question, unity, haunts the discussion and refuses to be ignored.

Husserl locates the origin of multiplicity in the activity of combining, which he takes to be a psychological process. After much consideration he identifies this activity as synthesis, or the gathering of items into a set. He notices then that synthetic unities are of two kinds. Either the relationship through which the multiple items belong to the one set *is a content of* the mental

representation of those items (right in there alongside them as another item that can be attended to and counted), or it is not there. In the former case, the unity is physical. Otherwise it is psychical, stemming from the unifying mental act that sets the contents into the relationship.

Having made that distinction between natural or physical unity, and arbitrary or imposed unity, Husserl then goes on to contrast these varieties of synthetic oneness with something else entirely: unsynthesized unity. His example is a rose, whose so-called parts are continuous and come apart only for the examining mind.

> **"In order to note the uniting relations in such a whole, analysis is necessary. If, for example, we are dealing with the representational whole which we call 'a rose,' we get at its various parts successively, by means of analysis: the leaves, the stem.... Each part is thrown into relief by a distinct act of noticing, and is steadily held *together with* those parts already segregated" (114).**

Ironically, Husserl has struck gold while mining coal, and doesn't quite recognize what he's got hold of. His description of *non*synthesized unity comes almost as a byproduct of his attempt to differentiate physical or real collective combination from psychic combination. He writes:

> **"... these combining relations present themselves as, so to speak, a certain 'more,' in contrast to the mere totality, which appears merely to seize upon its parts, but not really to *unite* them [because they're already united, independently of the mind!].... In the totality there is a lack of any intuitive unification, *as* that sort of unification so clearly manifests itself in the metaphysical or continuous whole" (114).**

Husserl has succeeded in distinguishing between natural and artificially synthesized wholes, on the one hand, and, on the other hand, those totalities that are known as having been accomplished neither by natural aggregation nor by mental combination. The unity of such wholes is known to be real, even though it admits of subsequent mental analysis or physical dissection.

Again ironically, in his concluding discussion of "number" Husserl neglects to notice the number one even as he employs it to illustrate how combination works. Substituting the term "and" for the term "collective combination," Husserl remarks:

> **"(T)otality or multiplicity *in abstracto* is nothing other than 'something or other', and 'something or other', and 'something or other', etc.; or, more briefly, one thing, and one thing, and one thing, etc. Thus we see that the concept of the multiplicity contains, besides the concept of collective combination, only the concept *something*. Now this most general of all concepts is, as to its origin and content, easily analyzed" (116).**

Husserl terms the concept *something* the most general concept. It stands for any object--real or unreal, physical or psychical--upon which we reflect. Thus he says that multiplicity as a concept arises out of the indetermination of the et-cetera that allows the series of "one and one and one and ..." to go however far you like.

Yet an objection must be registered concerning what Husserl has found but not noticed. Multiplicity is but *relatively* undetermined; ultimately, multiplicity is in fact determined, or reined in, by one itself. This happens at three points. (a) One is the starting point of the counting series. Every number except the first number is a multiplicity; therefore the set of natural numbers is greater (by one!) than the set of multiplicities. (b) One determines the unit of counting. Only *one* something at a time gets counted. The *and*'s must be put in between *one*'s. (c) Although the series can stop anywhere, nevertheless it has to stop at one single place, not at several places. Every

number is one distinct number.

Husserl, however, tries to produce the concept number by suppressing what he has taken to be the absolute indetermination of the *something*-series. This is how he gets determinate multiplicity, which he equates with number. In other words, the *and*'s are the main ingredient for making numbers Husserl-style. This is incorrect, of course, but it is incorrect in an interesting way. For example, to make the number five, you would need four *and*'s. To come up with those four *and*'s, you would have to count them out; but before you could count to four, you would need three *and*'s with which to make that four. But... there's a regression back to one. The number five is four and's, *and* five one's.

The maddening difficulty of focusing upon combination eventually will have a happy outcome, which Husserl did not see in 1887. The truly interesting problem is one, the prime ingredient in numbers and the determiner whose own determination was to become Husserl's guiding quest.

***LOGISCHE UNTERSUCHUNGEN* (*LOGICAL INVESTIGATIONS*, 1900-01). With the turn of the century, Husserl's attention turned from *and* to *one*; that is, away from the mental activity of combining, and toward that which is reliably there to be combined. He wanted to show that mental activity is not the source of the latter. Chapter 8 of LU I exposes and refutes the three premises or "prejudices" of psychologism. In short, "psychologism" for Husserl is the error of collapsing the normative or regulative discipline of logic down onto the merely descriptive discipline of psychology. It would make mental operations (such as combination) the source of their own regulation. The "should" of logic, that utter necessity inhering in logical inference, would become no more than the "is" or facticity of our customary thinking processes, empirically described.**

Husserl's formulation and refutation of the three psychologistic premises is wickedly clever, but cannot be treated in detail here. (See # 43-49 of LU I.) One example must suffice. Psychologism, Husserl charges, would place logical inferences on the same plane with mental operations (# 44), and this would make even mathematics into a branch of psychology (# 45). Indeed, math and logic do have structures that are isomorphic to those of mental operations, such as combination and distinction. But given that similarity, how then would one distinguish the *regulation* of any of these processes from the *description* of it? Under psychologism, there's no way. But Husserl makes the distinction in a way that also shows how regulation (i.e., the laws of logic) comes from elsewhere than the plane of mental activity.

And he does this by virtue of *one*. In # 46 Husserl agrees with his opponents that arithmetical operations occur in patterns that refer back to mental acts for their origin and also for their meaning. However, there's a difference between them as well. Mental acts transpire in time: they begin and end, and they can be repeated and individually counted. Numbers, in contrast, are timeless. While they can be represented in mental acts, this representation is not a fresh production of the number but rather an instantiation of its form. There is only *one* five. Any time we count five things, it isn't a production of a new five but merely a *deja vu* for the same old five, eternal five. We can't count numbers themselves, for there's only *one* of each. (A similar argument is made in #22 of *Ideas I*.)

The same goes for logic, Husserl says. Concepts comprising the laws of pure logic can have no empirical range. Their range or sphere is ideal singulars, not mental generalizations from multiple instantiations. The operators of logic are other than those mental acts that happen to share the same names: "and," "not," "is," "or," "implies," "may," "must," "should." Psychologically, there can be many factual acts of combining, negating, etc. Logically, there is only one "and," one

"not," etc. Husserl concedes here, as he did for arithmetic, that the logical operators take their origin and meaning from the mental acts. This accounts for the equivocal character of logical terms, which refer both to ideal singulars, and to mental states and acts. But if you fail to notice this equivocation, you become ensnared in psychologism, losing the possibility of pure logic and unified science.

The danger of equivocation extends over judgments as well. On the one hand, we can count multiple apperceptive events of affirmation, occurring psychologically, which proceed in time, begin and end, and recur as often as we like, in happenings that can be distinguished one from another. On the other hand, the judgment thus reached remains the same throughout each act accessing it. It seems to persist and to be called back for encore appearances; it seems even to have pre-existed its first appearance to me (# 47). In this latter sense, the judgment is not the same as the mental act that reaches it. Moreover, the truth of the judgment is neither equivalent to nor dependent upon the psychological experience of clear evidence that accompanies the mental act embracing it. Husserl easily shows this by recalling that in both logic and arithmetic, there are truths that have never been entertained in any human consciousness, and indeed could never be humanly conceived (# 50). (Cases of truth without the possibility of psychological evidence would include the computation of very large numbers, and decisions about membership in sets that are uncountably large. The arithmetical and logical operations connected with such determinations could never be "done" by a human mind or a computer. Their truth cannot be "factual.")

The number one, then, has become Husserl's touchstone for discriminating between psychological processes and logical laws. It is his reality detector. What is psychological (or empirical) comes on in discrete individual instances--ones--and you can examine their edges. What is logical (or ideal) comes on as a seamless oceanic unity without temporal edges, reliably persisting even when not attended to. Husserl's sensitivity to the modes of unity, first expressed in the Habilitationsschrift and developed in LU, provides the launching pad for transcendental phenomenology.

***IDEEN I* (*IDEAS I*, 1913). What launches transcendental phenomenology is the recognition that those modes of unity correlate with each other and with a third mode of unity, in ways that are tantalizingly asymmetrical. These three onenesses are: the factual unity of things and states of affairs, the eidetic unity of essences, and the living unity of consciousness as it flows along in a stream of experiences. Each has, and exhibits, its own distinctive kind of identity and persistence. Factual and essential unities give objects to the straightforward regard of consciousness, entering it as items of experience, each in its distinctive way; but consciousness can also deflect its regard back onto these enterings and discover its own unity, which is unlike either of theirs.**

The possibility of this complex correlation is provided by the "principle of principles": that intuitions come on to us with distinctive boundary-conditions that we can accept as sources insuring the correctness of our knowledge of them. Or in Husserl's formulation:

> **"... that every originary presentive intuition is a legitimizing source of cognition, that everything originarily (so to speak, in its "personal" actuality) offered to us in 'intuition' is to be accepted simply as what it is presented as being, but also only within the limits in which it is presented there" (44).**

The different kinds of unities have different kinds of edges, and these give away what kind of a unity each of them is going to be. But it's easy to miss the differences. That happens in the natural attitude, Husserl says, when all the objects of consciousness are taken as if they were factual items. Husserl complains that even his *Logische Untersuchungen* have been misunderstood as advocating

just this error of "Platonic realism," by those who read into his use of the term "object" the implication that, through a perverse hypostatization, every thought turns into a thing (# 22). On the contrary, he says, the eidetic reduction, operative already in LU, empowers him to differentiate between how essences appear, and how cases appear.

Now with *Ideen I*, this distinction is sketched in beautiful detail. You can tell when the object occupying your consciousness is a physical thing, because things don't give themselves to you all at once. What you get instead is a perspective inviting you to move around to the other side to perceive some more of the thing. All the while the thing keeps its unity to itself, as the reference point of all the angles it gives to you, and out of which you must reproduce or copy or simulate the unified thing as you conceive it. But in conceiving, you don't have to put an "and" between two separate perceptions, the north face of a building and the south face, in order to yield the perception of the building as if it were a sum. These different views are given to you as continuous, as views of *one* thing.

Husserl terms this "shading off" or adumbration. (The notion of off-shading is reminiscent of a multiple-exposure photograph that captures successive phases of a movement in a single frame. Such photos were being seen for the first time at the turn of the century. Husserl also mentions new media such as the stereoscope and the cinema.) In contrast, essences give themselves to you all at once. Their boundaries are not sides, but rather laws entailing the characteristic necessities and possibilities of kinds of things (more about which below). The unity of any particular essence coheres within that determinate outermost boundary which free imaginative variations of possible cases must not exceed if they are to remain cases of this particular kind. Essential unity is centripetal, so to speak.

Then are those other unities--the ones presenting themselves as extended or factual--to be termed centrifugal, inasmuch as each spins off appearances in all directions from an inaccessible center? No, for their off-shading appears contextualized, as a foreground; and even as we focus upon the foreground it pulls its background into readiness for perception as soon as attention may shift to it. Every *one* is surrounded by a halo of *and*'s, and beyond that are other somethings, seemingly without end. Whatever is extended is inexorably connected to whatever else is extended. (This last formulation, by the way, is an instance of an eidetic law. But the shift of attention that brings this essential rule into view is an eidetic reduction, and it wrenches us away from our naive attention to instances of things naturally appearing, under consideration here.) Every perception "motivates" another, stretching on toward expanding horizons.

The shift to the transcendental attitude--that is, the phenomenological or transcendental reduction--brings to Husserl's notice a third kind of unity, which discloses the off-shading of things in a startling new way. We notice now that what is adumbrated is spatial, but the adumbration itself is not spatial. It arises in consciousness. "*Abschattung ist Erlebnis*" (95), while what is adumbrated, *das Abgeschattete*, has to be something spatial. The off-shading of things is at the same time the streaming of conscious life. Peculiarly, the giving off of partial perceptibilities (by the thing) coincides with the taking up of partial perceptions (by streaming consciousness). Which one is doing the shading? Agency cannot be imputed absolutely to either side.

But on the "side" of consciousness, as it were, we now recognize that we are dealing with more than a progression of life-bites strung together in series with *and*'s. The stream of conscious life is not a sum or aggregate; nor is it a generalization. That is, it exhibits a unity unlike either the *sachverhaltig* unity of a factual case or the *eidetisch* unity of an essence. Husserl must account for

that unity, which he calls an ego, *Ich*.

Moreover, and of paramount significance, with the benefit of the transcendental reduction it can now be told that these three kinds of unities themselves are not connected merely in series, with *and*'s combining them, as if they were three discrete somethings. Their relationship is vastly more subtle. In order to understand it, through reduction we try to isolate unity from what accounts for unity. (We are not looking for something "prior to" unity -- such as some "cause" of unity --, because we can't have priority without having the number one, and oneness is just what is in question.)

Isolating oneness from the live experience-stream means removing the individual subject (you or me or Napoleon or whomever) from consideration. What is left, says Husserl, is transcendental subjectivity, "the pure act-process with its own essence" ("*das reine Akterlebnis mit seinem eigenen Wesen*"). (Paradoxically, we can see, right here in this formulation, that the reduction has not at all done away with essence, with states of affairs, or even with identity. We still have *Eigenheit* and *Wesen*, set in relation within a sentence. But these are now supposedly purified.) Husserl likens this de-individualized ego to a ray (# 92) or glance (# 101). Characteristically (or essentially) it has two poles or directions: the noematic and the noetic (from Greek terms *noema* and *noesis*, indicating what is thought and the act of thinking, respectively).

Husserl's discussion of "noetic-noematic structures" fails in its attempt to show how the ego reaches and secures both the unity of the known object, and the unity of the knowing subject. But it fails in a spectacular starburst of insight. Husserl notices that the mental stream has its own distinctive kind of adumbrations or continuities, which are more complex than those discussed above, the relatively simple off-shaded appearings of spatial objects in perception. Beyond that simple sort of off-shading, consciousness can also turn back on itself and reflect upon its own intending acts, or on any component thereof. The stream meanders among spatial objects, but can also at whim objectify aspects of its own acts of intending, and consider them. This yields a thick layering of possible objects (# 97). For example, here are some noemata that might enter the live experience stream: pencils ... writing ... German verbs ... the frustration of strong verbs ... Ulrike ... memories in general ... the unreliability of memory ... components of perceptions ... the advisability of analyzing perceptions into their components ... the smell of popcorn wafting into the study ... the effort to resist distractions ... and so forth.

Some of these arise directly from things, while others arise as objectifications of what was inherent a moment ago in the very act of knowing, the noesis. How can we tell the difference? Husserl answers that you can tell when the ego-beam has penetrated through to the bottom of the stack of noemata, so to speak, and has gotten ahold of a thing itself, because at that point, all the aspects of the thing are known immanently--really--in the act of perceiving as being contained in the sense of the thing (# 98). For example, you know popcorn itself when you are perceiving the taste of butter and salt. (You do not know popcorn when you read this sentence; instead, you are reflecting on what it is to know popcorn, and popcorn's qualities are not given immanently within your object. But then while tasting popcorn, saltiness was given immanently but not objectified.)

Husserl rightly points out that we are able to slide up and down the pole of the ego-beam at will, moving now toward the thing, now away from it to consider the act of knowing and its modalities. For example, noematically I can consider a certain cat who probably exists, but then I can turn back noetically to assess the degree of certitude that characterizes my consideration of that selfsame cat as existing (# 105). Now if we were to slide down to the point where all modalities are

behind us on the noetic side of the pole, and if there we were to face the object, we would get the pure sense of the object in which its unity is given.

In # 102 Husserl claims that this can happen, and that we can indeed slide far enough toward the object that the unity of the noema will be known as not having been imposed by the act of knowing. At that point, all of its qualities supposedly will be given immanently, really, contained in the perception rather than in the secondary conscious act that may grasp it a split-second later. Its sense will have been captured as something known with certainty to comprise its qualities, without the interference of a synthetic conscious act. (If this worked, it would effectively ensure the objectivity of knowledge, and would win the day for realism against idealism.) Husserl writes:

> **"The noematic objects ... are unities transcendent to, but evidentially intended to in, the mental process. But if that is the case, then characteristics, which arise *in* [those unities] for consciousness and which are seized upon as *their* properties in focusing the regard on them, cannot possibly be regarded as really inherent moments of the mental process" (248-249).**

Rather, they inhere in the object's sense, and subsequently are lifted out for analysis in the mental process.

The ambitiousness of this claim is matched by that of another, which has to do with the opposite end of the ego-pole. In # 108 Husserl says that we can also shinny far enough up the ego-pole that we can capture the affirming noesis in its purity. All the modalities will have been loaded over onto the side of the noema, and the no_sis will be a believing affirmation, pure and simple: an unqualified yes. Thus Husserl insists that there is a crucial difference between (a) being validly negated and (b) not-being. For example, he would distinguish (a) denying correctly that my spayed cat has a kitten, from (b) affirming that the kitten of my spayed cat is a non-entity. With (a), the negativity inheres in the noesis, which has not yet been purified of all modality; but with (b), the noesis would be pure affirmation (# 104).

How correct is Husserl's argument? We must grant that whatever makes this particular kitten impossible inheres elsewhere than in my knowing about it, for my denying something can't make it go away. Furthermore, there's nothing to prevent my forcing myself to think positively the thought of the kitten that my cat never had. Such a noetic posture is at least conceivable. However, its mere *possibility* is not enough to accomplish Husserl's purpose. Husserl needs to show that this pure affirming belief *really is done*, somewhere somehow, in the toughest case, the case of an intrinsically impossible entity such as the kitten of a spayed cat. (That is, has anyone succeeded in recapturing that magic moment of purely affirming noesis with regard to an intrinsically impossible object? And if so, how would one go about certifying the accomplishment?)

Unfortunately, neither end of the ego-ray connects as Husserl had hoped. At the noetic pole, the purely affirming ego eludes the grasp of consciousness; so does the pure sense of the thing itself, at the noematic pole. These terms may remain as ideal asymptotes toward which the ego-ray continually points while continually falling short. The successful recovery of the connection between knowing and reality awaits another strategy, to be mounted by Husserl in the posthumously published second volume of *Ideen*.

***IDEEN II* (*IDEAS II*). The second volume of Husserl's *Ideen* (publication withheld until 1952) is the work of many hands. Husserl was dissatisfied with it and did not publish it. The first draft was written very rapidly in 1912, immediately after the manuscript of the first volume was completed. Husserl added material in 1915, and turned it over for editing to his assistant Edith Stein, who had**

come with him to Freiburg from Gottingen. Stein transcribed the work from Husserl's shorthand in 1916. He gave her further material, and in 1918 she produced a collation arranged and titled as at present: the constitution of material nature, of animal nature, and of the cultural world. But Husserl's phenomenology was evolving, and the manuscript did not suit him. Another assistant, Ludwig Landgrebe, worked on it 1923-25, and Husserl himself edited it in again 1928. It finally came out posthumously.

If the pursuit of unity had guided Husserl like a north star from his earliest writing on through the discovery and first articulation of phenomenology, then in *Ideen II* that star becomes obscured by "light pollution" from numerous more recent and competing insights. Without access to the manuscripts, it is impossible to know with precision how that came about. In portions of the text as we have it, the concern with unity remains a significant factor.

However, other portions seem to go against the grain of key insights from the first volume and the earlier works. For example, in LU and *Ideen I*, the material sphere had comprised states of affairs; that is, facts or cases such as could be expressed in logical propositions. There were indeed "things" in there, such as roses, yet the emphasis was upon the factual scenarios into which these things figured. By contrast, in *Ideen II* "material nature" is populated with substantial items, and the fact they are embedded in circumstances has to be additionally stipulated, almost as an afterthought (# 15c). By the same token, in the earlier work the eidetic sphere had comprised the forms of logical propositions and the rules of inference. While there were indeed "essences" entailed there, nevertheless the emphasis fell upon the lawful patterns of thinking about being. By contrast, in *Ideen II* "animal nature" is populated by psychic items whose unity is analogous to that of physical things yet whose active engagement with the latter can hardly be explained.

This shift matters, because judgments and perceptions reach unity in quite different ways. To certify that one selfsame *proposition* (e.g., that the cat is on the mat) returns to our consciousness on several occasions is quite a different task than to certify that one selfsame *substantial entity* (e.g., this mat-loving cat) returns to our sight every afternoon. Husserl's early discoveries about unity had to do with judgment, and they were based upon the lived difference between synthetic judgments and analytic judgments. His ambitions then were not primarily metaphysical or epistemological. Moreover, it is relatively easy to "feel" the difference among three sorts of judgment: (a) a synthetic judgment that arbitrarily groups several items together, (b) a synthetic judgment that groups things in recognition of some characteristic that all share independently of the judgment, and (c) a judgment that the unity imputed to a thing is not owing to judgment at all. The distinction among these judgment-forms was already established in the Habilitationsschrift. However the task undertaken in *Ideen II* is forcibly to transpose that distinction onto perception, and so to come up with a general test for certifying when knowledge is genuinely in touch with reality.

This project is set in motion in # 9, where new terminology is introduced for the threefold distinction first made in "*Begriff der Zahl*." (However, now that the transcendental reduction is presupposed, the arrow of causality should be removed. There can be only correlation or its absence.) BZ's "psychic relation" now becomes "categorial synthesis," in which perception serendipitously collects disparate items into one group, for no special reason intrinsic to the items. BZ's "content relation" (or "physical relation") becomes "aesthetic synthesis" (or "sensuous synthesis"), in which perception recognizes some intrinsic reason for grouping these items and finds itself constrained to do so by something other than mere whim. And BZ's uncomposed unity (e.g., "that rose there") becomes the "pure sense-object."

In BZ, "synthesis" meant a combining judgment: a judgment that erected a set of things with many members. A set with one member--that is, a unified thing--obviously needed no synthesizing judgment to set it up. In *Ideen II*, however, "synthesis" means a perception that, while receiving multiple impressions (the off-shadings or *Abschattungen*), composes an object out of them. But this object is a unity, not a group; in fact, it is what Husserl would earlier have called an *uncomposed* unity. In other words aesthetic synthesis--operating now over partial views, not discrete items--finds that it has a reason for referring those multiple impressions to one object, even though the unity of the thing never gives itself directly to consciousness. What is that reason? This question is enticing, because Husserl is tantalizingly close here to describing a way in which the real unity of things is available for knowledge.

Husserl works on this question in # 15b, where "the spatial body is a synthetic unity of a manifold of strata of 'sensuous appearances' of different senses" (42-43). The spatially extended thing is a unity drawing together all the experiences we have had of it, and summoning us toward further experiences of it through sight and touch and our other senses. It achieves its unity as a spatial location, which seems not to depend upon whether or not it is actually perceived.

However, Husserl cautions, this unity alone is insufficient to validate itself. He writes:

> **"(W)e have first taken the body as independent of all causal conditioning, i.e., merely as a unity which presents itself visually or tactually, through multiplicities of sensations, as endowed with an inner content of characteristic features.... But in what we have said, it is also implied that under the presupposition referred to (namely, that we take the thing outside of the nexuses in which it is a thing) we do not find, as we carry out experiences, any possibility for deciding, in a way that exhibits, whether the experienced material thing is actual or whether we are subject to mere illusion and are experiencing a mere phantom" (43).**

Thus, reality is not guaranteed for an isolated item, even when it seems to be giving us a reason to take it as the unified core attracting its manifold appearings to one hub of reference. The central location of the thing is dependent upon its real circumstances, as Husserl goes on to say in # 15c. The reality of "one" depends on "others"; i.e., on thing-connection. The thing is what it is in relation to its surroundings. This becomes apparent when things move and change, for their changes must correlate coherently with reciprocal changes in the things next to them.

Such co-variance is what certifies reality--or materiality, which Husserl seems to equate with it. In # 15c, reality means substantial causality. Within the webwork of material things, everything affects everything else. The real is the causal. Co-variance across the material realm, then, is what certifies the oneness and reality of that realm (# 15e).

Animated bodies also connect in the webwork of material things (# 13). Each of them is a center of appearings, a *one*, just as every other thing is. However, unlike soulless bodies, each animal is also a *zero*. It lives at a point of origination. The animal body bears the zero-point of orientation for the pure ego (61), as its absolute "here" (135, 166). Arithmetically, this is a stunning contrast. Every "something" whatsoever is either a *one* or a *one-and-one-and-etc*. But the animated body, *in addition* to being just one of those somethings, is also the one who is zero: the one from whom the counting starts, the one who chooses whether and where it is appropriate to insert the *and*'s.

But any series that is initiated by/at/in the living body is counted off nonarbitrarily. Such series go in order; they are "motivated." This is owing to the movement of the body itself within the material web. The body's own kinesthetic sense will coordinate with the corresponding changes in

sensory perceptions as it navigates among things. Thus, the zero shifts position in relation to the other unified centers to which perceptions accrue; but as it does so, the series of their appearings change in a regular way (63).

What about counting zero's? Are they multiple; are there many human bodies? Husserl declines to pursue this avenue of approach into the problem of other minds and human community. Intersubjectivity will treated instead as an *implication* of the reality of the material world, not a *precondition* for it. The multiplicity of bodies is taken up only on page 83, where it is admitted that the foregoing analysis has been framed on the assumption that there would be only one, "solipsistic," point-zero in reality. Belatedly, other bodies now are brought into the picture--but not because they are necessary for its unity, or because they have been apprehended among the realities presenting to consciousness. The others are brought in because they are required for the full unification of the thing in reality, whether that thing is one of the physical bodies or my very own live body. To be is to be describable (87). Reality for the thing entails a possibility of appearing to anyone at all. Being counted from one zero-point is not enough for the real thing. To count, it needs the possibility of being counted from multiple directions.

> **The thing is a rule of appearances. That means that the thing is a reality as a unity of a manifold of appearances connected according to rules. Moreover, this unity is an intersubjective one.... The physicalistic thing is *intersubjectively* common in that it has validity for all individuals who stand in possible communion with us (91-92).**

To be real, the thing must count as a place or location, a center, independently of any particular point of origin. Yet what grants reality to the thing is not some consensus reached by observers. Indeed, the thing may look entirely different to different observers; however, its reality constrains all to agree that, at least, "it is there." Oddly, then, the real thing is another kind of zero, for its barest reality consists in its being an empty place-holder (91-93).

Finally, Husserl makes unity a synonym for the philosophical term "substance" as traditionally meant. For example, he says that both the soul and the body are unities, so that an analogy obtains between psychic unity and material unity (129, 131). Oneness becomes the ontological form that determines substantial reality (133). The pure ego is *one* with respect to an individual stream of consciousness, that is, before the transcendental reduction has de-individuated the latter (117); however the pure ego is insubstantial and *not one* whenever the reduction is in effect (128).

And so Husserl's quest for unity splinters and spends itself out by diverting into many contradictory projects pursued by the many unharmonized voices of *Ideen II*. Although the manuscript remained unpublished, it was made available for consultation by a number of Husserl's younger colleagues. Among the last publication of Husserl's lifetime was the *Cartesian Meditations* of 1931, in which he addressed the apparent solipsism of his transcendental phenomenology. That work itself was undergoing a comprehensive reworking in partnership with Husserl's assistant Eugen Fink during the years before Husserl's death in 1938.

HUSSERL'S PUBLISHED WORKS: Husserl's publications and his extensive *Nachlass* are being brought out in a multi-volume critical edition entitled *Husserliana - Edmund Husserl, Gesammelte Werke*, from Nijhoff in The Hague. The major works published during Husserl's lifetime are the following:

> ***Über den Begriff der Zahl. Psychologische Analysen*, 1887.**
>
> ***Philosophie der Arithmetik. Psychologische und logische Untersuchungen*, 1891.**

Logische Untersuchungen. Erste Teil: Prolegomena zur reinen Logik, 1900; reprinted 1913.

Logische Untersuchungen. Zweite Teil: Untersuchungen zur Phänomenologie und Theorie der Erkenntnis, 1901; second edition 1913 (for part one); second edition 1921 (for part two).

"Philosophie als strenge Wissenschaft," _Logos_ 1 (1911) 289-341.

Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie. Erstes Buch: Allgemeine Einführung in die reine Phänomenologie, 1913.

"Vorlesungen zur Phänomenologie des inneren Zeitbewusstseins," _Jahrbuch für Philosophie und phänomenologische Forschung_ 9 (1928), 367-498.

"Formale und transzendentale Logik. Versuch einer Kritik der logischen Vernunft," _Jahrbuch für Philosophie und phänomenologische Forschung_ 10 (1929) 1-298.

Méditations cartésiennes, 1931.

"Die Krisis der europäischen Wissenschaften und die transzentale Phänomenologie: Eine Einleitung in die phänomenologische Philosophie," _Philosophia_ 1 (1936) 77-176.

Thomas Henry Huxley (1825-1895)

Thomas Henry Huxley, the distinguished zoologist and advocate of Darwinism, madeseveral incursions into philosophy. From his youth he had studied its problems unsystematically; he had a way of going straight to the point in any discussion; and, judged by a literary standard, he was a great master of expository and argumentative prose. Apart from his special work in science, he had an important influence upon English thought through his numerous addresses and essays on the topics of science, philosophy, religion, and politics. Among the most important of his papers relevant here are those entitled 'The Physical Basis of Life' (1868), and 'On the Hypothesis that Animals are Automata' (1874), along with a monograph on Hume (1879) and the Romanes lecture *Ethics and Evolution* (1893). Huxley is credited with the invention of the term 'agnosticism' to describe his philosophical position: it expresses his attitude towards certain traditional questions without giving any clear delimitation of the frontiers of the knowable. He regards consciousness as a collateral effect of certain physical causes, and only an effect--never also a cause. But, on the other hand, he holds that matter is only a symbol, and that all physical phenomena can be analyzed into states of consciousness. This leaves mental facts in the peculiar position of being collateral effects of something that, after all, is only a symbol for a mental fact; and the contradiction is left without remark.

His contributions to ethics are still more remarkable. In a paper entitled 'Science and Morals' (1888), he concluded that the safety of morality lay "in a real and living belief in that fixed order of nature which sends social disorganization on the track of immorality." His Romanes lecture reveals a different tone. In it the moral order is contrasted with the cosmic order; evolution shows constant struggle; instead of looking to it for moral guidance, he "repudiates the gladiatorial theory of existence." He saw that the facts of historical process did not constitute validity for moral conduct; and his plain language compelled other to see the same truth. But he exaggerated the opposition between them and did not leave room for the influence of moral ideas as a factor in the historical process.

Another man of science, William Kingdon Clifford, professor of mathematics in London, dealt in occasional essays with some central points in the theory of knowledge, ethics, and religion. In these essays he aimed at an interpretation of life in the light of the new science. There was insight as well as courage in all he wrote, and it was conveyed in a brilliant style. But his work was cut short by his early death in 1879, and his contributions to philosophy remain suggestions only.

Identity Theory

Identity theory is a position in the philosophy of mind which maintains that mental states and brain activities are identical, though viewed from two perspectives. Identity theory is a form of monistic materialism, insofar as it maintains that mind is essentially material in nature. As such, it is an alternative to classical dualism which holds that minds and mental events are made of a spiritual substance which is distinct from one's material body. Identity theory was developed to address the short comings of behaviorism, which maintains that mental terms designate dispositions to behave in certain ways. The key difference is that behaviorism denies mental states (focusing instead on only observable behavior); identity theory, by contrast, acknowledges mental states but identifies them with brain activity. Further, whereas behaviorism is usually seen as a semantic theory about the meaning of terms, identity theory is a scientific claim about mental states and brain activities themselves.

Three principal types of identity theory have been proposed. The first, associated with J.J.C. Smart, and sometimes called brain process materialism, is that sensations are identical with brain processes. A second version, called central state materi alism, and associated with David Armstrong, is that mental states are identical with states of the brain and central nervous system. A third and more subtle version, offered by Herbert Feigl, is that certain neuro-physiological terms denote certain mental terms. Following Frege's distinction between sense and reference, Feigl argues that the terms differ in meaning, but their referents are the same. This is similar to how the terms "morning star" and "evening star" both have different meanings, yet refer to the same object, namely venus. Insofar as identity theory (especially Feigl's account) proposes an identity of referents, rather than an identity of meanings, it follows Leibniz's law of identity. This law states that that two things are identical only if they have all properties in common and is symbolically represented as follows: (x)(y) [(x = y) > (F) (Fx = Fy)]. Accordingly, criticisms of identity theory follow Leibniz's law.

One possible criticism against identity theory is that mental events and brain activity are not identical since we know some things about the one, but not about the other. For example, I immediately experience a variety of memories, yet I do not know where memories are stored in my brain. However, this kind of equal knowledge is not necessary for identity. For example, we can safely say that the vice president of the United States and the president of the US. Senate both denote the same thing. However, we may know some things about the role of the vice president, but nothing of the role of the president of the Senate.

Other criticisms are more problematic. Perhaps the most common criticism of identity theory is that mental descriptions and material descriptions are not identical since there are still the three points which distinguish them: localizability in space , objective observability, and intentionality. That is, by Leibniz's Law, properties asserted about one described term (e.g., I am in pain) can also be asserted about the other term (e.g., activated C-fibers). However, these features apply to only

one of the descriptions and not the other. Jerome Shaffer offers the following line of reasoning for the issue of localizability in space:

1. **Brain processes are spatial events (have location)**
2. **Sensations are not spatial**
3. **The rules of identity maintain that what is true of one side of the equation must be true of the other side**
4. **Therefore the two cannot be identical**

The same argument applies to the feature of objective observability which is a feature of brain processes, and not experienced sensations. By contrast, intentional states (or attitudes about a thing), such as believing F, assuming F, fearing F, apply to mental events, and not to material brain activity. Similarly, it is appropriate for me to describe my experience of a pain as sharp or shooting, although it is not appropriate to talk about brain processes as sharp or shooting. In response, identity theorists argue that these problems are linguistic inconveniences which can be remedied with new language conventions. Perhaps someday language of sensation will follow a spatial model, particularly as we learn more about brain states.

A third criticism maintains points out that identity theorists seek to reduce mental descriptions to material descriptions, and thereby eliminate mental descriptions. For example, the mental description "I am in pain" would be eliminated in place of a material description "C-fibers are activated." The problem is that Leibniz's law does not permit the elimination of either of the descriptions. This is evident by seeing that x and y can be reversed in the above formula and still mean the same thing. More intuitively, both descriptions in Leibniz's law must be seen as permanent, otherwise, this would lead to a slippery slope of other identity claims which eliminate terms which we do not want to eliminate. For example, suppose that I identify a given chair as concentration of microparticles. Although my two description ("chair" and "concentration of microparticles") refer to the same object, I do not want to eliminate either description; both serve their own purpose in their own context. Thus, identity theorists are not entitled to use the notion of identity alone as a justification for eliminating mental descriptions in favor of material descriptions.

A fourth criticism is that identity theory is chauvinistic: it restricts mental events to biological systems. However, the possibility is open that nonbiological systems, such as computers, can exhibit mental consciousness. This criticism is especial ly appropriate to "type physicalists" who hold that mental activity takes place in only biological types of organisms. This is opposed to token physicalists, who hold that biological systems are only one kind of system which can have mental activity. The criticism of chauvinism has been especially decisive in redirecting discussions in the philosophy of mind away from identity theory and toward functionalism. For, according to functionalism, the kinds of cause-effect relationships which produce mental eve nts in biological systems may also be instantiated in nonbiological systems.

A final revision of identity theory is worthy of mentioning. The above account of identity theory may be described as *translation* identity theory insofar as mental descriptions are translated into biological descriptions. An alternative versio n, as presented by Rorty and Feyerabend, is called *disappearance* identity theory. On this view, mental talk is eliminated and replaced with talk about brain activity (e.g. c-fibers). Indeed, talk of all mental phenomenon is eliminated similar to ta lk of ghosts or demon possession. This version does not follow Leibniz's law, and thus is not susceptible to the above problems associated with it. However, disappearance identity theory is not really an

identity **theory, per se. Instead, it is more like eliminative materialism, as offered by Patricia Churchland, which holds that there are no such things as conscious mental phenomenon, and we should eliminate all mental references. For Churchland, mentalese descriptions are like talk of ghosts which should be done away with. As such, disappearance identity theory it is susceptible to the problems associated with that view. The principle problem here is that mental states such as pain do not seem to be on the same level as ghosts, and are not easily eliminated.**

Interventionism

The theory of interventionism examines the nature and justifications of interfering with another polity or choices made by individuals. Interventionism is characterized by the use or threat of force or coercion to alter a political or cultural situation nominally outside the intervenor's moral or political jurisdiction. It commonly deals with a government's interventions in other governments' affairs--and is thus an aspect of political philosophy, but it can also be extended to interventions in others' cultures, religions, lifestyles, and economic activities--and thus can fit into applied ethics, covering such issues as paternalism, imperialism, and topics in business, medical, and environmental ethics.

A note on methodological considerations

The context of interventionism requires an epistemological consideration. A methodological individualist will argue that it involves interventions in the lives of individuals; that essentially it does not matter whether the individuals are part of one's political entity or belonging to another--interventionism applies solely to individuals. A methodological holist on the other hand will identify the object of interventionism as groups--cultural, political, religious, national, and so on. Whilst the methodological individualist will focus on issues that infringe or attempt to alter individuals' rights or choices, the holist will draw attention to issues affecting groups and their identities. Methodological compatibilism holds that interventions do affect individual rights or choices but individuals also identify themselves with groups who can also be separately affected by interference. For example, demanding that all female bank employees wear blue dresses affects the individual's choice of clothes in the workplace but also interferes with the banking corporation's right to determine its own standard of dress.

What does interventionism deal with?

Beyond epistemological considerations interventionism commonly deals with the justifications of governments to interfere in (a) the lives of its own civilian population--domestic interventions, and (b) the activities of other nations--foreign interventions. In the case of domestic interventionism that apparatus is the police force (or the army acting as a domestic policing force as with the British army in Northern Ireland 1969-date); in the case of international interventionism it is the army. In either scenario interventionism implies the potential or actual use of coercion.

Reasoning or persuading another group of people that a chosen policy, or a certain tradition, is wrong either morally (given a certain standard) or on consequentialist considerations (the policy will not achieve what it's meant to achieve) are not examples of interventionism. Reasoning includes all forms of rhetoric, example, persuasion, exhortation, counseling, discourse, and so on. The other group changes policy or tradition only if it desires --is persuaded-- to change. They do so voluntarily. On the other hand, it may be claimed that in attempting to persuade others to change their minds is a form of interventionism. But this definition then becomes too broad to be of use--merely speaking to another or judging their behavior in the absence of any threats, coercion, or force, cannot be termed

interventionist, for its goal is not to interfere but to explain possible choices.

Breaking diplomatic relations also does not imply the use of force and hence is not a form of interventionism. This is an essentially peaceful attempt to alter another government's actions in effect by removing acknowledgement of its international political status.

Voluntary decisions on the part of a people may change a nation's values. Trading in goods and ideas can change a society, yet such changes should not, for the most part, be deemed interventionist. Changes in culture and language that result from the voluntary decisions of many individuals cannot be tied to any form of interventionism, for the policy of interventionism is a policy of threatening or using coercion or force of some description. Whether such examples exist is hard to ascertain, for commonly the expansion of freedom of trade that has led to an exchange of ideas and hence of cultures is historically almost universally connected with imperialist policies that do aim at explicit forms of intervention. Following World War Two (1939-45) when Western imperialism dwindled as a political value, it can be argued that various societies (e.g., Taiwan, Malaysia) voluntarily took up what are referred to as 'Western values' through the influence of non-violent commercial ventures. However, critics may point out that previous military interventions could be considered as necessary precursors to changes in the culture of the people.

Coercion is a form of interventionism. Coercion implies offering choices that normally would not be accepted, but which leave the individual to choose the option preferred by the coercer, or by default one that is less acceptable. For example: if a knife is held to your throat and you are given the option to hand over your car keys or die, you are being coerced; if a government demands that you open up your borders to a free trade in opium or face armed conflict (China, Opium Wars with Britain) your nation is being coerced.

Domestic interventions entail restricting the choices of individuals or groups or altering their activities through legislative coercion. Limiting freedom of speech or trade, restricting occupational access to certain religious groups, or enforcing the draft are examples of interventions in the choices of individuals or groups, while increasing beer taxes are examples of altering choices through legislative frameworks; failure to comply may incur penalties.

On the international level, interventionist activities involve threatening, coercing, or forcing another group or nation to alter its behavior or change its government or policies. International interventionism can incorporate direct activities such as the use or threat of war, as well as indirect activities such as assassination, subversion, and economic embargoes of all descriptions (complete or partial blockades, transport restrictions, etc.).

General goals of international interventionism include attempting to change: governments (e.g., Iran, 1979); people's expectations of governmental activities; general attitudes of just conduct not held as appropriate in the wider international community (e.g., South African Apartheid). Specific goals can include changing a state apparatus or its personnel (the government), to remove a particular statesperson or group, to change specific or general policies, to alter cultural or political beliefs, or even to alter patterns of economic and population distributions.

Arguments for interventionism

Utilitarian or consequentialist prescriptions are open-ended: they could support interventions either generally or in particular circumstances, depending on expected results. Other positions offer more principled cases for interventionism, for example on epistemological grounds, political realism or rights analyses.

Epistemological reasons

Intervening can be justified on grounds of the government possessing better knowledge than individual agents, or from paternalistic reasons, which presume the target agents are incapable of making informed choices themselves. To that extent, governments may legislate a range of programs from ensuring that people take out adequate insurance or invest sufficiently into pensions to requiring health checks or continued education; or economic interventions could be justified on the grounds that economic agents (investors, corporations, banks) do not act in the long term interest of the nation, whereas civil servants who are deemed above the profit motive can take the longer view (as held by John Maynard Keynes 1883-1946, for example).

Political realism

Political realism is defined by the primacy of national interest in international affairs. This can be viewed as either a moral duty or as a description of the ruling state of affairs. Policy prescriptions involve pursuing interventions as they benefit the national interest. The theory implies that states should be left alone to seek and to defend their own interests. In the realist tradition, of which there are many shades, such supporters include Thucydides, Machiavelli, and Hobbes.

Political realism offers a broad interventionist doctrine that can justify intervening for reasons of economic profit as well as for balance of power considerations. The history of the British Empire provides many examples of both justifications (Cf. its interventions in European politics in the War of the Spanish Succession 1702-13 and the War of the Austrian Succession 1740-8), whilst post-war US foreign policy offers more recent case studies (Vietnam War 1961-73 and the Gulf War 1990-91). It is captured by Thucydides' description of the Pelopennesian War, that it was Spartan "fear of Athenian growth" that caused the war. Realists often invoke consequentialist concerns regarding the developing international state of affairs--that should the foreign power to grow unchecked, a war would ensue, or economic resource bases would be lost, or an invasion could occur. The Schlieffen Plan, prior to the First World War (1914-18) is another useful example of balance of power considerations.

Political realism assumes that interests are to be maintained through the exercise of power, and that the world is characterized by competing power bases (nation states [Hegel], for example, or classes [Marx]). Political realism is essence reduces to the ethical principle that might is right.

Rights theories

Some claim that rights only pertain to individuals, and that nations and governments only acquire any rights or privileges by virtue of the civilians giving them power. Rights theorists thus argue that individual rights supersede or 'trump' the rights or privileges of governments. On this basis, interventions in support of rights are morally justifiable. For example, if a foreign government tyrannizes its civilians, an intervention to support their rights can be justified, for the moral status of rights does not end at political borders. However, what needs to be considered is at what point do rights violations justify an intervention, or would an intervention do more harm than good? Second is the argument from hypocrisy--can a nation be justified in intervening in another's affairs when it does not have a clean slate of its own? Finally, given that rights are being violated, is a government guilty of moral failure if it fails to intervene, and if so, is that moral failure a failure of its duty or of virtuous behavior?

Non-interventionist doctrines

Non-interventionism is the theory that one does not have any moral justification in intervening in others' affairs. On a rights based analysis, or from Kantian considerations of duty, this may be

considered an absolutist prohibition on the grounds that it either violates others' rights to freedom or respect due them as individual moral entities. Consequentialists may infer from evidence that interventionism is always counter-productive and should not be practiced. In contemporary ethical analysis, a rule utilitarian may claim that since interventions never work (an empirical, testable hypothesis), ethical considerations aimed at maximizing the greatest good for the greatest number should employ non-interventionism on principle. However, act utilitarians may agree that historically interventions have not worked, but that does not mean that they will not in a future situation, and hence non-interventionism should not be held categorically.

As a political-economical doctrine, non-interventionism includes the economic doctrine of laissez-faire, which holds that governments should not intervene in the economic activities of individuals or corporations. Some thinkers, notably Herbert Spencer (1820-1903) have extended the doctrine to moral issues too, arguing, for example, that intervening in the plight of the poor only makes their condition worse by creating an atmosphere of dependency, rather than leaving them to independently struggle and find their own values. Other supporters of the economic laissez-faire doctrine do not go as far as Spencer; Friedrich von Hayek argues (Constitution of Liberty, 1956) that governments do have responsibilities to the poor resulting from their duty to provide a general framework to ensure the smooth operation of the free market system.

On a broader view, non-interventionism is applied by John Stuart Mill in On Liberty; he claims that responsibility to others only goes so far as ensuring they know of the dangers that may befall them, but does not extend to actually physically restraining those who would knowingly injure themselves. In the international sphere, Mill ("Notes on Intervention" Collected Works) argues for a policy of self-determination: that other people be allowed to make their own mistakes, and hence forge their own paths to freedom; intervening paternalistically on their behalf will not be conducive to their learning the value of freedom in its own right. Such a stance can be used in a variety of issues including freedom of press and expression. For example, John Milton in Areopagitica argues: "And though all the winds of doctrine were let loose to play on the earth, so Truth be in the field, we do injuriously by licensing and prohibiting to misdoubt her strength. Let her and Falsehood grapple; who ever knew Truth put to the worse in a free and open encounter?"

Legal positivism and non-interventionism

In the international sphere, legal positivists are commonly non-interventionists. Legal positivists, following Christian Wolff (1679-1754), argue that nation states possess absolute rights to political sovereignty and territorial integrity, which implies that national borders be inviolable. Wolff writes: "Nations are regarded as individual free persons living in a state of nature. For they consist of a multitude of men united into a state. Therefore since states are regarded as individual free persons living in a state of nature, nations must also be regarded in relation to each other as individual free persons living in a state of nature." (Jus Gentium Methodo Scientifica Pertractatum Trans. Joseph Drake. Clarendon Press: Oxford, 1934, §2, p.9) The positivist theory of international relations implies that interventions would violate international borders; this position itself resolves into an absolutist doctrine that deems interventions should never be condoned and more pragmatic positions that permit some exceptions to the rule.

Positivist exceptions to non-interventionism emanate from humanitarian considerations that overwhelm nominally sacrosanct national borders, if the target state is violating basic human rights to such an extent that it can no longer be deemed a proper representative of its people. The type of interventionism supported depends on the theory of the state entertained.

If governments are viewed as instrumental institutions that exist to uphold the domestic rights of civilians, then a violation of its remit can warrant an intervention on behalf of the citizens. Michael Walzer in Just and Unjust Wars (1977) entertains this position, arguing that only in extreme cases of rights violations "that shock the moral conscience of mankind" (p.107), can interventions be supported. He gives the examples of genocide, mass murder or enslavement. Rights violations above this level, he implies, are not grounds for interventionism (e.g., removal of free movement, freedom of the press, etc).

A Hobbesian case for interventionism can be maintained by those who consider governments the sole and proper moral and legal authorities. Hobbes claims that individuals give up the rights that they possess in the state of nature (except the right of self-preservation) to the state (the 'Leviathan'). He argues the State should be obeyed, even it is acting quite tyrannically, for the alternative --and the greater evil-- is the state of war in which justice and morality do not hold. However, if a state acts to takes its civilians into the state of nature by governing incompetently or unjustly then the people have a right to form a new state. This allows the legal positivist to condone interventions where governments have obviously failed in their obligations and have brought war to the people through their ineptitude.

The third possible justification for the positivist is when a supra-legal body legislates in favor of an intervention. For example, the United Nations has the jurisdiction to pass a resolution of intervention, but it does not condone unilateral interventions. Positivists draw parallels here between governments arbitrating in domestic disputes and a world body acting to dissolve international disputes.

Isolationism

Isolationism is the political doctrine of non-involvement in foreign affairs. The state, it is argued, should confine its activities to its own jurisdiction, and therefore, what happens abroad is of no concern. Isolationism can be argued from a consequentialist perspective: that getting involved would only make matters (whatever those matters are) worse; or from an intrinsicist perspective similar to the legal positivist case, that national jurisdiction (and hence moral and political concerns) ends at the political borders.

Economic interventionism

Government intervention in the economy was noted above. Whilst the effects and the principles are the subject matter of economics, philosophers can fruitfully examine the nature of the epistemological arguments used in the debates which involve considerations of methodological individualism versus holism, and a-priori versus a-posteriori reasoning.

Friedrich Heinrich Jacobi (1743-1819)

German philosopher; born at Dusseldorf January. 25,1743; died at Munich March. 10, 1819. He studied at Frankfort and Geneva, and in 1764 became the head of his father's business in Dusseldorf. After his appointment to the council for the duchies of Julich and Berg in 1772 he devoted himself entirely to literature and philosophy. His house at Pempelfort, near Dusseldorf, became the meeting-place of distinguished literary men. Among his more intimate friends were Wieland, Hamann, Herder, Lessing, and Goethe. On account of the political agitation of the time he went to Holstein in 1794. During the next ten years he resided chiefly at Wandsbeek, Hamburg, and Eutin. In 1804 he accepted a call to Munich in connection with the proposed Academy of Sciences there. He was president of the academy from its opening in 1807 till 1812. His writings are characterized by poetic fancy and religious sentiment rather than by logical necessity. He held that the understanding can only join and disjoin given facts, without explaining them, and that knowledge deduced in this way is conditioned and relatively unimportant, being always related to a background of existence which forever remains beyond abstract thinking. All demonstrable knowledge, therefore, is relative and conditioned; it does not touch the ultimate nature of things. The faculty by which we grasp ultimate facts is not the understanding, but faith, which Jacobi identified with reason. It was Jacobi who first pointed out the fatal contradiction involved in Kant's application of the category of causality to the *Ding an Sich*. His doctrine of the relativity of knowledge was later exploited by Sir William Hamilton. Jacobi's principal works are the two philosophical novels, *Woldmwr* (2 vols., Flensburg, 1779) and *Eduard Allwills Briefsamlung* (Breslau, 1781); Ueber die Lehre der Spinoza (1785; enlarged ed., 1789*); Dazid Hunw fiber den Glauben, oder Ide-alis;nus und Realismus* (1787), containing his criticism of Kant*; Ueber das Unternehmen des Kritizismus, die Vernunft zu Verstande zu bringen* (Hamburg, 1801); and *Von den gottlichen Dingen und ihrer Offenbarung* (Leipsic, 1811), which was directed against Schelling. During his last years Jacobi was employed in collecting and editing his *Werke* (6 vols., Leipsic, 1812-24). His *Auserlesener Briefwechsel* was edited by F. Roth (2 vols., 1825-27).

Just War Theory

Just war theory deals with the justification of how and why wars are fought. The justification can be either theoretical or historical. The theoretical aspect is concerned with ethically justifying war and forms of warfare. The historical aspect, or the "just war tradition" deals with the historical body of rules or agreements applied (or at least existing) in various wars across the ages. For instance international agreements such as the Geneva and Hague conventions are historical rules aimed at limiting certain kinds of warfare. It is the role of ethics to examine these institutional agreements for their philosophical coherence as well as to inquire into whether aspects of the conventions ought to be changed.

Historically, the just war tradition--a set of mutually agreed rules of combat--commonly evolves between two similar enemies. When enemies differ greatly because of different religious beliefs, race, or language, war conventions have rarely been applied. It is only when the enemy is seen to be a people with whom one will do business in the following peace that tacit or explicit rules are formed for how wars should be fought and who they should involve. In part the motivation is seen to be mutually beneficial--it is preferable to remove any underhand tactics or weapons that may provoke an indefinite series of vengeance acts. Nonetheless, it has been the concern of the majority of just war theorists that such asymmetrical morality should be denounced, and that the rules of war should apply to all equally. That is just war theory should be universal.

The just war tradition is as old as warfare itself. Early records of collective fighting indicate that some moral considerations were used by warriors. They may have involved consideration of women and children or the treatment of prisoners. Commonly they invoked considerations of honour: some acts in war have always been deemed dishonourable, whilst others have been deemed honourable. Whilst the specifics of what is honourable differ with time and place, the very fact of one moral virtue has been sufficient to infuse warfare with moral concerns.

The just war theory also has a long history. Whilst parts of the Bible hint at ethical behavior in war and concepts of just cause, the most systematic exposition is given by Saint Thomas Aquinas. In the *Summa Theologicae* Aquinas presents the general outline of what becomes the just war theory. He discusses not only the justification of war, but also the kinds of activity that are permissible in war. Aquinas's thoughts become the model for later Scholastics and Jurists to expand. The most important of these are: Francisco de Vitoria (1548-1617), Francisco Suarez (1548-1617), Hugo Grotius (1583-1645), Samuel Pufendorf (1632-1704), Christian Wolff (1679-1754), and Emerich de Vattel (1714-1767). In the twentieth century it has undergone a revival mainly in response to the invention of nuclear weaponry and American involvement in the Vietnam war. The most important contemporary texts include Michael Walzer's *Just and Unjust Wars* (1977), Barrie Paskins and Michael Dockrill *The Ethics of War* (1979), Richard Norman *Ethics, Killing, and War* (1995), as well as seminal articles by Thomas Nagel "War and Massacre", Elizabeth Anscombe

"War and Murder", and a host of others, commonly found in the journals *Ethics* or *The Journal of Philosophy and Public Affairs*.

Against the just war (*justum bellum*) are those of a skeptical persuasion who do not believe that morality can or should exist in war. There are various positions against the need or the possibility of morality in war. Generally, consequentialists and act utilitarians may claim that if victory is sought then all methods should be employed to ensure it is gained at a minimum of expense and time. Arguments from 'military necessity' are of this type: for example, to defeat Germany in World War II, it was deemed necessary to bomb civilian centers, or in the US Civil War, for General Sherman to burn Atlanta. However, intrinsicists may also decree that no morality can exist in the state of war, for they may claim it can only exist in a peaceful situation in which recourse exists to conflict resolving institutions. Or intrinsicists may claim that possessing a just cause (the argument from righteousness) is a sufficient condition for pursuing whatever means are necessary to gain a victory or to punish an enemy. A different skeptical argument, one advanced by Michael Walzer, is that the invention of nuclear weapons alter war so much that our notions of morality--and hence just war theories--become redundant. However, against Walzer, it can be reasonably argued that although such weapons change the nature of warfare they do not dissolve the need to consider their use within a moral framework.

Whilst sceptical positions may be derived from consequentialist and intrinsicist positions, they need not be. Consequentialists can argue that there are long term benefits to having a war convention. For example, by fighting cleanly, both sides can be sure that the war does not escalate, thus reducing the probability of creating an incessant war of counter-revenges. Intrinsicists can argue that certain spheres of life ought never to be targeted in war: for example, hospitals and densely populated suburbs. The inherent problem with both ethical models is that they become either vague or restrictive when it comes to war. Consequentialism is an open-ended model, highly vulnerable to pressing military needs to adhere to any code of conduct in war: if more will be gained from breaking the rules than will be lost, the consequentialist cannot but demur to military necessity. On the other hand, intrinsicism can be so restrictive that it permits no flexibility in war: whether it entails a Kantian thesis of respecting others or a classical rights position, intrinsicism produces an inflexible model that would restrain warrior's actions to the targeting of permissible targets only. In principle such a prescription is commendable, yet the nature of war is not so clean cut when military targets can be hidden amongst civilian centers.

Against these two ethical positions, just war theory offers a series of principles that aim to retain a plausible moral framework for war. From the just war (*justum bellum*) tradition, theorists distinguish between the rules that govern the justice of war (*jus ad bellum*) from those that govern just and fair conduct in war (*jus in bello*). The two are by no means mutually exclusive, but they offer a set of moral guidelines for waging war that are neither unrestricted nor too restrictive. The problem for ethics involves expounding the guidelines in particular wars or situations.

THE *JUS AD BELLUM* CONVENTION

The principles of the justice of war are commonly held to be: having just cause, being declared by a proper authority, possessing right intention, having a reasonable chance of success, and the end being proportional to the means used. One can immediately detect that the principles are not wholly intrinsicist nor consequentialist--they invoke the concerns of both models. Whilst this

provides just war theory with the advantage of flexibility, the lack of a strict ethical framework means that the principles themselves are open to broad interpretations. Examining each in turn draws attention to the relevant problems.

Possessing just cause is the first and arguably the most important condition of *jus ad bellum*. Most theorists hold that initiating acts of aggression is unjust and gives a group a just cause to defend itself. But unless 'aggression' is defined, this proscription rather open-ended. For example, just cause resulting from an act of aggression can ostensibly be responses to a physical injury (e.g., a violation of territory), an insult (an aggression against national honor), a trade embargo (an aggression against economic activity), or even to a neighbor's prosperity (a violation of social justice). The onus is then on the just war theorist to provide a consistent and sound account of what is meant by just cause. Whilst not going into the reasons of why the other explanations do not offer a useful condition of just cause, the consensus is that an initiation of physical force is wrong and may justly be resisted. Self-defense against physical aggression, therefore, is putatively the only sufficient reason for just cause. Nonetheless, the principle of self-defense can be extrapolated to anticipate probable acts of aggression, as well as in assisting others against an oppressive government or from another external threat (interventionism). Therefore, it is commonly held that aggressive war is only permissible if its purpose is to retaliate against a wrong already committed (e.g., to pursue and punish an aggressor), or to pre-empt an anticipated attack.

The notion of proper authority seems to be resolved for most of the theorists, who claim it obviously resides in the sovereign power of the state. But the concept of sovereignty raises a plethora of issues to consider here. If a government is just, i.e., it is accountable and does not rule arbitrarily, then giving the officers of the state the right to declare war is reasonable. However, the more removed from a proper and just form a government is, the more reasonable it is that its sovereignty disintegrates. A historical example can elucidate the problem: when Nazi Germany invaded France in 1940 it set up the Vichy puppet regime. What allegiance did the people of France under its rule owe to its precepts and rules? A Hobbesian rendition of almost absolute allegiance to the state entails that resistance is wrong; whereas a Lockean or instrumentalist conception of the state entails that a poorly accountable, inept, or corrupt regime possesses no sovereignty, and the right of declaring war (to defend themselves against the government or from a foreign power) is wholly justifiable. The notion of proper authority therefore requires thinking about what is meant by sovereignty, what is meant by the state, and what is the proper relationship between a people and its government.

The possession of right intention is ostensibly less problematic. The general thrust of the concept being that a nation waging a just war should be doing so for the cause of justice and not for reasons of self-interest or aggrandizement. Putatively, a just war cannot be considered to be just if reasons of national interest are paramount or overwhelm the pretext of fighting aggression. However, possessing right intention masks many philosophical problems. According to Kant, possessing good intent constitutes the only condition of moral activity, regardless of the consequences envisioned or caused, and regardless, or even in spite, of any self interest in the action the agent may have. The extreme intrinsicism of Kant can be criticized on various grounds, the most pertinent here being the value of self-interest itself. At what point does right intention separate itself from self-interest? On the one hand, if the only method to secure peace is to annex a belligerent neighbor's territory, political aggrandizement is intimately connected with the proper intention of maintaining the peace. On the other hand, a nation may possess just cause to defend an oppressed group, and may

rightly argue that the proper intention is to secure their freedom, yet such a war may justly be deemed too expensive or too difficult to wage; i.e., it is not ultimately in their self-interest to fight the just war. On that account, some may demand that national interest is paramount: only if waging war on behalf of freedom is also complemented by the securing of economic or other military interests should a nation commit its troops. The issue of intention raises the concern of practicalities as well as consequences, both of which should be considered before declaring war.

The next principle is that of reasonable success. This is another necessary condition for waging just war, but again is insufficient by itself. Given just cause and right intention, the just war theory asserts that there must be a reasonable probability of success. The principle of reasonable success is consequentialist in that the costs and benefits of a campaign must be calculated. However, the concept of weighing benefits poses moral as well as practical problems as evinced in the following questions. Should one not go to the aid of a people or declare war if there is no conceivable chance of success? Is it right to comply with aggression because the costs of not complying are too prohibitive? Is it not sometimes morally necessary to stand up to a bullying larger force, as the Finns did when Russia invaded in 1940, for the sake of national self-esteem? Besides, posturing for defense may sometimes make aggression itself too costly, even for a much stronger side. However, the thrust of the principle of reasonable success emphasizes that human life and economic resources should not be wasted in what would obviously be an uneven match. For a nation threatened by invasion, other forms of retaliation or defense may be available, such as civil disobedience, or even forming alliances with other small nations to equalize the odds. Historically, many nations have overcome the probability of defeat: the fight may seem hopeless, but a charismatic leader or rousing speech can sometimes be enough to stir a people into fighting with all their will. Winston Churchill offered the British nation some of the finest of war's rhetoric when it was threatened with defeat and invasion by Nazi Germany in 1940. For example: "Let us therefore brace ourselves to do our duty, and so bear ourselves that, if the British Commonwealth and its Empire lasts for a thousand years, men will still say, 'This was their finest hour.'" …And "What is our aim?…Victory, victory at all costs, victory in spite of all terror; victory, however long and hard the road may be; for without victory, there is no survival." (Speeches to Parliament, 1940).

The final guide of *jus ad bellum,* is that the desired end should be proportional to the means used. This principle overlaps into the moral guidelines of how a war should be fought, namely the principles of *jus in bello*. With regards to just cause, a policy of war requires a goal, and that goal must be proportional to the other principles of just cause. Whilst this commonly entails the minimizing of war's destruction, it can also invoke general balance of power considerations. For example, if nation A invades a land belonging to the people of nation B, then B has just cause to take the land back. According to the principle of proportionality, B's counter-attack must not invoke a disproportionate response: it should aim to retrieve its land. That goal may be tempered with attaining assurances that no further invasion will take place. But for B to invade and annex regions of A is nominally a disproportionate response, unless (controversially) that is the only method for securing guarantees of no future reprisals. For B to invade and annex A and then to continue to invade neutral neighboring nations on the grounds that their territory would provide a useful defense against other threats is even more unsustainable.

On the whole the principles offered by *jus ad bellum* are useful guidelines. Philosophically however they invoke a plethora of problems by either their independent vagueness or by mutually inconsistent results. They are nonetheless a useful starting point for ethics and remain a pressing

concern for statesmen and women.

THE PRINCIPLES OF *JUS IN BELLO*

The rules of just conduct fall under the two broad principles of discrimination and proportionality. The principle of discrimination concerns who are legitimate targets in war, whilst the principle of proportionality concerns how much force is morally appropriate. One strong implication of being a separate topic of analysis for just war theorists, is that a nation fighting an unjust cause may still fight justly, or vice verse. A third principle can be added to the traditional two, namely the principle of responsibility, which demands an examination of where responsibility lies in war.

In waging war it is considered unfair and unjust to attack indiscriminately, since non-combatants or innocents are deemed to stand outside the field of war proper. Immunity from war can be reasoned from the fact that their existence and activity is not part of the essence of war, which is killing combatants. Since killing itself is highly problematic, the just war theorist has to proffer a reason why combatants become legitimate targets in the first place, and whether their status alters if they are fighting a just or unjust war. Firstly, a theorist may hold that being trained and/or armed constitutes a sufficient threat to combatants on the other side. Voluntarists may invoke the boxing ring analogy: punching another individual is not morally supportable in a civilized community, but those who voluntarily enter the boxing ring renounce their right not to be hit. Similarly, those who join an army renounce their rights not to be targeted in war; the rights of non-combatants (civilians, or 'innocents') remain intact and therefore they cannot be justly attacked. Others, avoiding a rights analysis, may argue that those who join the army (or who have even been pressed into conscription) come to terms with being a target, and hence their own deaths. This is argued for example by Barrie Paskins and Michael Dockrill in *The Ethics of War* (1979). However, since civilians can just as readily come to terms with their own deaths, their argument is not sufficient to defend the principle of discrimination. Rights based analyses are more productive, especially those that focus on the renouncing of rights by combatants by virtue of their war status, leaving a sphere of immunity for civilians.

Warfare sometimes unavoidably involves civilians. Whilst the principle of discrimination argues for their immunity from war, the practicalities of war provoke the need for a different model. The doctrine of double effect offers a justification for killing civilians in war, so long as their deaths are not intended but are accidental. Targeting a military establishment in the middle of a city is permissible according to the doctrine of double effect, for the target is legitimate. Civilian casualties are a foreseeable but accidental effect. Whilst the doctrine provides a useful justification of 'collateral damage' to civilians, it raises a number of issues concerning the justification of foreseeable breaches of immunity, as well as the balance to strike between military objectives and civilian casualties.

Another problem arises in defining who is a combatant and who is not. Usually combatants carry arms openly, but guerrillas disguise themselves as civilians. Michael Walzer, in his *Just and Unjust Wars* (1977) claims that the lack of identification does not give a government the right to kill indiscriminately--the onus is on the government to identify the combatants. Others have argued that the nature of modern warfare dissolves the possibility of discrimination. Civilians are just as necessary causal conditions for the war machine as are combatants, therefore, they claim, there is no moral distinction in targeting an armed combatant and a civilian involved in arming or feeding

the combatant. The distinction is, however, not closed by the nature of modern economies, since a combatant still remains a very different entity from a non-combatant, if not for the simple reason that the former is presently armed (and hence has renounced rights or is prepared to die, or is a threat), whilst the civilian is not. On the other hand, it can be argued that being a civilian does not necessarily mean that one is not a threat and hence not a legitimate target. If Mr Smith is the only individual in the nation to possess the correct combination that will detonate a device, then he becomes not only causally efficacious in the firing of a weapon of war, but also morally responsible; reasonably he also becomes a legitimate military target. His job effectively militarizes his status. The underlying issues that ethical analysis must deal with involve the logical nature of an individual's complicity, or aiding and abetting the war machine, with greater weight being imposed on those logically closer than those logically further from the war machine in their work. At a deeper level, one can consider the role that civilians play in supporting an unjust war; to what extent are they morally culpable, and if they are culpable to some extent, does that mean they may become legitimate targets? This invokes the issue of collective versus individuality responsibility that is in itself a complex topic.

The second principle of just conduct is that any offence should remain strictly proportional to the objective desired. This principle overlaps with the proportionality principle of just cause, but it is distinct enough to consider it in its own light. Proportionality for *jus in bello* requires tempering the extent and violence of warfare to minimise destruction and casualties. It is broadly utilitarian in that it seeks to minimize overall suffering, but it can also be understood from other moral perspectives, for instance, from harboring good will to all (Kantian ethics), or acting virtuously (Aristotelian ethics). Whilst the consideration of discrimination focuses on who is a legitimate target of war, the principle of proportionality deals with what kind of force is morally permissible. In fighting a just war in which only military targets are attacked, it is still possible to breach morality by employing disproportionate force against an enemy. Whilst the earlier theoreticians, such as Thomas Aquinas, invoked the Christian concepts of charity and mercy, modern theorists may invoke either consequentialist or intrinsicist prescriptions, both are which remain problematic as the foregoing discussions have noted. However, it does not seem morally reasonable to completely gun down a barely armed belligerent tribe. At the battle of Omdurman in the Sudan, six machine gunners killed thousands of dervishes--the gunners may have been in the right to defend themselves, but the principle of proportionality demands that a battle ends before it becomes a massacre. Similarly, following the battle of Culloden, Cumberland ordered "No Quarter", which was not only a breach of the principle of discrimination, for his troops were permitted to kill the wounded as well as supporting civilians, but also a breach of the principle of proportionality, since the battle had been won, and the Jacobite cause effectively defeated on the battle field.

The principles of proportionality and discrimination aim to temper war's violence and range. They are complemented by other considerations that are not taken up in the traditional exposition of *jus in bello*, especially the issue of responsibility.

***Jus in bello* requires that the agents of war be held responsible for their actions. This ties in their actions to morality generally. Some, such as Saint Augustine argues against this assertion: "who is but the sword in the hand of him who uses it, is not himself responsible for the death he deals." Those who act according to a divine command, or even God's laws as enacted by the state and who put wicked men to death "have by no means violated the commandment, 'Thou shalt not kill.'"**

Whilst this issue is connected to the concepts of just cause, it does not follow that individuals waging a just, or unjust war, should be absolved of breaching the principles of just conduct. Readily it can be accepted that soldiers killing other soldiers is part of the nature of warfare, but when soldiers turn their weapons against non-combatants, or pursue their enemy beyond what is reasonable, then they are no longer committing legitimate acts of war but acts of murder. The principle of responsibility re-asserts the burden of abiding by rules in times of peace on those acting in war. The issues that arise from this principle include the morality of obeying orders (for example, when one knows those orders to be immoral), as well as the status of ignorance (not knowing of the effects of one's actions).

The foregoing has described the main tenets of the just war theory, as well as some of the problems that it entails. The theory bridges theoretical and applied ethics, since it demands an adherence, or at least a consideration of meta-ethical conditions and models, as well as prompting concern for the practicalities of war. A few of those practicalities have been mentioned here. Other areas of interest are: hostages, innocent threats, international blockades, sieges, the use of weapons of mass destruction or of anti-personnel weapons (e.g., land mines), and interventionism.

Justification

"Justification" is a term used in both ethics and epistemology. In ethics it deals with determining right actions and appropriate beliefs. In epistemology, justification is the central component to knowledge as justified true belief.

As a component of knowledge, the concept of justification excludes beliefs arrived at through guesses or hunches since proper argumentation is built into our notion of knowledge. However, William James conceived of a type of justification (with reference to the belief in God) as the "will to believe." This concept does not involve empirical evidence or logical argumentation. When reason is neutral, it allows that one can be justified in belief through private evidence, such as the desire to know whether God exists.

Although one cannot have knowledge of a belief without justification, at the same time, one can be justified in believing something which is false. For example, if someone were sitting in an apartment with no windows and heard the meteorologist say that it was raining in their town, then we could say that belief was justified. The resident even hears noises which sounded like water drops falling outside, but it is a neighbor watering the flowers. Here is a set of extraordinary reasons for a justified belief that it is raining. However, it may be false that it is raining. Thus, justification is many times simply being able to give adequate reasons for a belief. This, though can lead us to false conclusions from mistaken beliefs or self deception.

Determining what counts as adequate reasons is an obstacle to providing justification. This process of reason giving can be viewed as argumentation in four major forms: inductive, deductive, conclusive, and *prima facie*. Inductive and deductive justification involve evidence and logical evaluation. In a conclusive argument, reasons are analyzed by asking if another rational human would have the same belief given the same reasons. *prima facie* argumentation is a process of giving several reasons for believing something and choosing the most important one.

Immanuel Kant (1724-1804) Metaphysics

Immanuel Kant is one of the most influential philosophers in the history of Western philosophy. His contributions to metaphysics, epistemology, ethics, and aesthetics have had a profound impact on almost every philosophical movement that followed him. This portion of the encyclopedia entry will focus on his metaphysics and epistemology in one of his most important works, *The Critique of Pure Reason*. (All references will be to the A (1781) and B(1787) edition pages in Werner Pluhar's translation. Indianapolis: Hackett, 1996.) A large part of Kant's work addresses the question "What can we know?" The answer, if it can be stated simply, is that our knowledge is constrained to mathematics and the science of the natural, empirical world. It is impossible, Kant argues, to extend knowledge to the supersensible realm of speculative metaphysics. The reason that knowledge has these constraints, Kant argues, is that the mind plays an active role in constituting the features of experience and limiting the mind's access to the empirical realm of space and time.

Historical Background to Kant

In order to understand Kant's position, we must understand the philosophical background that he was reacting to. First, I will present a brief overview of his predecessor's positions with a brief statement of Kant's objections, then I will return to a more detailed exposition of Kant's arguments. There are two major historical movements in the early modern period of philosophy that had a significant impact on Kant: Empiricism and Rationalism. Kant argues that both the method and the content of these philosophers' arguments contain serious flaws. A central epistemological problem for philosophers in both movements was determining how we can escape from within the confines of the human mind and the immediately knowable content of our own thoughts to acquire knowledge of the world outside of us. The Empiricists sought to accomplish this through the senses and *a posteriori* reasoning. The Rationalists attempted to use *a priori* reasoning to build the necessary bridge. A posteriori reasoning depends upon experience or contingent events in the world to provide us with information. That "Bill Clinton is president of the United States in 1999," for example, is something that I can know only through experience; I cannot determine this to be true through an analysis of the concepts of "president" or "Bill Clinton." A priori reasoning, in contrast, does not depend upon experience to inform it. The concept "bachelor" logically entails the ideas of an unmarried, adult, human male without my needing to conduct a survey of bachelors and men who are unmarried. Kant believed that this twofold distinction in kinds of knowledge was inadequate to the task of understanding metaphysics for reasons we will discuss in a moment.

Empiricism

Empiricists, such as Locke, Berkeley, and Hume, argued that human knowledge originates in our sensations. Locke, for instance, was a representative realist about the external world and placed great confidence in the ability of the senses to inform us of the properties that empirical objects really have in themselves. Locke had also argued that the mind is a blank slate, or a *tabula rasa,* that becomes populated with ideas by its interactions with the world. Experience teaches us everything, including concepts of relationship, identity, causation, and so on. Kant argues that the blank slate model of the mind is insufficient to explain the beliefs about objects that we have; some components of our beliefs must be brought by the mind to experience.

Berkeley's strict phenomenalism, in contrast to Locke, raised questions about the inference from the character of our sensations to conclusions about the real properties of mind-independent objects. Since the human mind is strictly limited to the senses for its input, Berkeley argued, it has no independent means by which to verify the accuracy of the match between sensations and the properties that objects possess in themselves. In fact, Berkeley rejected the very idea of mind-independent objects on the grounds that a mind is, by its nature, incapable of possessing an idea of such a thing. Hence, in Kant's terms, Berkeley was a material idealist. To the material idealist, knowledge of material objects is ideal or unachievable, not real. For Berkeley, mind-independent material objects are impossible and unknowable. In our sense experience we only have access to our mental representations, not to objects themselves. Berkeley argues that our judgments about objects are really judgments about these mental representations alone, not the substance

that gives rise to them. In the **Refutation of Material Idealism**, Kant argues that material idealism is actually incompatible with a position that Berkeley held, namely that we are capable of making judgments about our experience.

David Hume pursued Berkeley's empirical line of inquiry even further, calling into question even more of our common sense beliefs about the source and support of our sense perceptions. Hume maintains that we cannot provide a priori or a posteriori justifications for a number of our beliefs like, "Objects and subjects persist identically over time," or "Every event must have a cause." In Hume's hands, it becomes clear that empiricism cannot give us an epistemological justification for the claims about objects, subjects, and causes that we took to be most obvious and certain about the world.

Kant expresses deep dissatisfaction with the idealistic and seemingly skeptical results of the empirical lines of inquiry. In each case, Kant gives a number of arguments to show that Locke's, Berkeley's, and Hume's empiricist positions are untenable because they necessarily presupposes the very claims they set out to disprove. In fact, any coherent account of how we perform even the most rudimentary mental acts of self-awareness and making judgments about objects must presuppose these claims, Kant argues. Hence, while Kant is sympathetic with many parts of empiricism, ultimately it cannot be a satisfactory account of our experience of the world.

Rationalism

The Rationalists, principally Descartes, Spinoza, and Leibniz, approached the problems of human knowledge from another angle. They hoped to escape the epistemological confines of the mind by constructing knowledge of the external world, the self, the soul, God, ethics, and science out of the simplest, indubitable ideas possessed innately by the mind. Leibniz in particular, thought that the world was knowable a priori, through an analysis of ideas and derivations done through logic. Supersensible knowledge, the Rationalists argued, can be achieved by means of reason. Descartes believed that certain truths, that "if I am thinking, I exist," for example, are invulnerable to the most pernicious skepticism. Armed with the knowledge of his own existence, Descartes hoped to build a foundation for all knowledge.

Kant's **Refutation of Material Idealism** works against Descartes' project as well as Berkeley's. Descartes believed that he could infer the existence of objects in space outside of him based on his awareness of his own existence coupled with an argument that God exists and is not deceiving him about the evidence of his senses. Kant argues in the Refutation chapter that knowledge of external objects cannot be inferential. Rather, the capacity to be aware of one's own existence in Descartes' famous *cogito* argument already presupposes that existence of objects in space and time outside of me.

Kant had also come to doubt the claims of the Rationalists because of what he called **Antinomies**, or contradictory, but validly proven pairs of claims that reason is compelled toward. From the basic principles that the Rationalists held, it is possible, Kant argues, to prove conflicting claims like, "The world has a beginning in time and is limited as regards space," and "The world has no beginning, and no limits in space." (A 426/B 454) Kant claims that antinomies like this one reveal fundamental methodological and metaphysical mistakes in the rationalist project. The contradictory claims could both be proven because they both shared the mistaken metaphysical assumption that we can have knowledge of things as they are in themselves, independent of the conditions of our experience of them.

The Antinomies can be resolved, Kant argues, if we understand the proper function and domain of the various faculties that contribute to produce knowledge. We must recognize that we cannot know things as they are in themselves and that our knowledge is subject to the conditions of our experience. The Rationalist project was doomed to failure because it did not take note of the contribution that our faculty of reason makes to our experience of objects. Their a priori analysis of our ideas could inform us about the content of our ideas, but it could not give a coherent demonstration of metaphysical truths about the external world, the self, the soul, God, and so on.

Kant's Answers to his Predecessors

Kant's answer to the problems generated by the two traditions mentioned above changed the face of philosophy. First, Kant argued that that old division between *a priori* truths and *a posteriori* truths employed by both camps was insufficient to describe the sort of metaphysical claims that were under dispute. An analysis of knowledge also requires a distinction between **synthetic** and **analytic** truths. In an analytic claim**,** the predicate is contained within the subject. In the claim, "Every body occupies space," the property of occupying space is revealed in an analysis of what it means to be a body. The subject of a synthetic claim, however, does not contain the predicate. In, "This tree is 120 feet tall," the concepts are synthesized or brought together to form a new claim that is not contained in any of the individual concepts. The Empiricists had not been able to prove **synthetic a priori** claims like "Every event must have a cause," because they had conflated "synthetic" and "a posteriori" as well as "analytic" and "a priori." Then they had assumed that the two resulting categories were exhaustive. A synthetic a priori claim, Kant argues, is one that must be true without

appealing to experience, yet the predicate is not logically contained within the subject, so it is no surprise that the Empiricists failed to produce the sought after justification. The Rationalists had similarly conflated the four terms and mistakenly proceeded as if claims like, "The self is a simple substance," could be proven analytically and a priori.

Synthetic a priori claims, Kant argues, demand an entirely different kind of proof than those required for analytic, a priori claims or synthetic, a posteriori claims. Indications for how to proceed, Kant says, can be found in the examples of synthetic a priori claims in natural science and mathematics, specifically geometry. Claims like Newton's, "the quantity of matter is always preserved," and the geometer's claim, "the angles of a triangle always add up to 180 degrees" are known a priori, but they cannot be known merely from an analysis of the concepts of matter or triangle. We must "go outside and beyond the concept. . . joining to it a priori in thought something which I have not thought in it." (B 18) A synthetic a priori claim constructs upon and adds to what is contained analytically in a concept without appealing to experience. So if we are to solve the problems generated by Empiricism and Rationalism, the central question of metaphysics in the *Critique of Pure Reason* reduces to "How are synthetic a priori judgments possible?" (19) If we can answer that question, then we can determine the possibility, legitimacy, and range of all metaphysical claims.

Kant's Copernican Revolution: Mind Making Nature

Kant's answer to the question is complicated, but his conclusion is that a number of synthetic a priori claims, like those from geometry and the natural sciences, are true because of the structure of the mind that knows them. "Every event must have a cause" cannot be proven by experience, but experience is impossible without it because it describes the way the mind must necessarily order its representations. We can understand Kant's argument again by considering his predecessors. According to the Rationalist and Empiricist traditions, the mind is passive either because it finds itself possessing innate, well-formed ideas ready for analysis, or because it receives ideas of objects into a kind of empty theater, or blank slate. Kant's crucial insight here is to argue that experience of a world as we have it is only possible if the mind provides a systematic structuring of its representations. This structuring is below the level of, or logically prior to, the mental representations that the Empiricists and Rationalists analyzed. Their epistemological and metaphysical theories could not adequately explain the sort of judgments or experience we have because they only considered the results of the mind's interaction with the world, not the nature of the mind's contribution. Kant's methodological innovation was to employ what he calls a **transcendental argument** to prove synthetic a priori claims. Typically, a transcendental argument attempts to prove a conclusion about the necessary structure of knowledge on the basis of an incontrovertible mental act. Kant argues in the **Refutation of Material Idealism** that "There are objects that exist in space and time outside of me," (B 274) which cannot be proven by a priori or a posteriori methods, is a necessary condition of the possibility of being aware of one's own existence. It would not be possible to be aware of myself as existing, he says, without presupposing the existing of something permanent outside of me to distinguish myself from. I am aware of myself as existing. Therefore, there is something permanent outside of me.

This argument is one of many transcendental arguments that Kant gives that focuses on the contribution that the mind itself makes to its experience. These arguments lead Kant to conclude that the Empiricists' assertion that experience is the source of all our ideas. It must be the mind's structuring, Kant argues, that makes experience possible. If there are features of experience that the mind brings to objects rather than given to the mind by objects, that would explain why they are indispensable to experience but unsubstantiated in it. And that would explain why we can give a transcendental argument for the necessity of these features. Kant thought that Berkeley and Hume identified at least part of the mind's a priori contribution to experience with the list of claims that they said were unsubstantiated on empirical grounds: "Every event must have a cause," "There are mind-independent objects that persist over time," and "Identical subjects persist over time." The empiricist project must be incomplete since these claims are necessarily presupposed in our judgments, a point Berkeley and Hume failed to see. So, Kant argues that a philosophical investigation into the nature of the external world must be as much an inquiry into the features and activity of the mind that knows it.

The idea that the mind plays an active role in structuring reality is so familiar to us now that it is difficult for us to see what a pivotal insight this was for Kant. He was well aware of the idea's power to overturn the philosophical worldviews of his contemporaries and predecessors, however. He even somewhat immodestly likens his situation to that of Copernicus in revolutionizing our worldview. On the Lockean view, mental content is given to the mind by the objects in the world. Their properties migrate into the mind, revealing the true nature of objects. Kant says, "Thus far it has been assumed that all our cognition must conform to objects" (B xvi). But that approach cannot explain why some claims like, "every event must have a cause," are a priori true. Similarly, Copernicus recognized that the movement of the stars cannot be explained by making them revolve around the observer; it is the observer that must be revolving. Analogously, Kant argued that we must reformulate the way we think about our relationship to objects. It is the mind itself which gives objects at least some of their characteristics because they must conform to its structure and conceptual capacities. Thus, the mind's active role in helping to create a world that is experiencable must put it at the center of our philosophical investigations. The appropriate starting place for any philosophical inquiry into knowledge, Kant decides, is with the mind that can have that knowledge.

Kant's critical turn toward the mind of the knower is ambitious and challenging. Kant has rejected the dogmatic metaphysics of the Rationalists that promises supersensible knowledge. And he has argued that Empiricism faces serious limitations. His transcendental method will allow him to analyze the metaphysical requirements of the empirical method without venturing into speculative and ungrounded metaphysics. In this context, determining the "transcendental" components of knowledge means determining, "all knowledge which is occupied not so much with objects as with the mode of our knowledge of objects in so far as this mode of knowledge is to be possible *a priori*." (A 12/B 25)

The project of the *Critique of Pure Reason* is also challenging because in the analysis of the mind's transcendental contributions to experience we must employ the mind, the only tool we have, to investigate the mind. We must use the faculties of knowledge to determine the limits of knowledge, so Kant's *Critique of Pure Reason* is both a critique that takes pure reason as its subject matter, and a critique that is conducted by pure reason.

Kant's argument that the mind makes an a priori contribution to experiences should not be mistaken for an argument like the Rationalists' that the mind possesses innate ideas like, "God is a perfect being." Kant rejects the claim that there are complete propositions like this one etched on the fabric of the mind. He argues that the mind provides a formal structuring that allows for the conjoining of concepts into judgments, but that structuring itself has no content. The mind is devoid of content until interaction with the world actuates these formal constraints. The mind possesses a priori templates for judgments, not a priori judgments.

Kant's Transcendental Idealism

With Kant's claim that the mind of the knower makes an active contribution to experience of objects before us, we are in a better position to understand **transcendental idealism**. Kant's arguments are designed to show the limitations of our knowledge. The Rationalists believed that we could possess metaphysical knowledge about God, souls, substance, and so; they believed such knowledge was transcendentally real. Kant argues, however, that we cannot have knowledge of the realm beyond the empirical. That is, transcendental knowledge is ideal, not real, for minds like ours. Kant identifies two a priori sources of these constraints. The mind has a receptive capacity, or the **sensibility**, and the mind possesses a conceptual capacity, or the **understanding.**

In the **Transcendental Aesthetic** section of the *Critique*, Kant argues that sensibility is the understanding's means of accessing objects. The reason synthetic a priori judgments are possible in geometry, Kant argues, is that space is an a priori form of sensibility. That is, we can know the claims of geometry with a priori certainty (which we do) only if experiencing objects in space is the necessary mode of our experience. Kant also argues that we cannot experience objects without being able to represent them spatially. It is impossible to grasp an object as an object unless we delineate the region of space it occupies. Without a spatial representation, our sensations are undifferentiated and we cannot ascribe properties to particular objects. Time, Kant argues, is also necessary as a form or condition of our intuitions of objects. The idea of time itself cannot be gathered from experience because succession and simultaneity of objects, the phenomena that would indicate the passage of time, would be impossible to represent if we did not already possess the capacity to represent objects in time.

Another way to understand Kant's point here is that it is impossible for us to have any experience of objects that are not in time and space. Furthermore, space and time themselves cannot be perceived directly, so they must be the form by which experience of objects is had. A consciousness that apprehends objects directly, as they are in themselves and not by means of space and time, is possible--God, Kant says, has a purely intuitive consciousness--but our apprehension of objects is always mediated by the conditions of sensibility. Any discursive or concept using consciousness (A 230/B 283) like ours must apprehend objects as occupying a region of space and persisting for some duration of time.

Subjecting sensations to the a priori conditions of space and time is not sufficient to make judging objects possible. Kant argues that the understanding must provide the concepts, which are rules for identifying what is common or universal in different representations.(A 106) He says, "without sensibility no object would be given to us; and without understanding no object would be thought. Thoughts without content are empty; intuitions without concepts are blind." (B 75) Locke's mistake was believing that our sensible apprehensions of objects are thinkable and reveal the properties of the objects themselves. In the **Analytic of Concepts** section of the *Critique*, Kant argues that in order to think about the input from sensibility, sensations must conform to the conceptual structure that the mind has available to it. By applying concepts, the understanding takes the particulars that are given in sensation and identifies what is common and general about them. A concept of "shelter" for instance, allows me to identify what is common in particular representations of a house, a tent, and a cave.

The empiricist might object at this point by insisting that such concepts do arise from experience, raising questions about Kant's claim that the mind brings an a priori conceptual structure to the world. Indeed, concepts like "shelter" do arise partly from experience. But Kant raises a more fundamental issue. An empirical derivation is not sufficient to explain all of our concepts. As we have seen, Hume argued, and Kant accepts, that we cannot empirically derive our concepts of causation, substance, self, identity, and so forth. What Hume had failed to see, Kant argues, is that even the possibility of making judgments about objects, to which Hume would assent,

presupposes the possession of these fundamental concepts. Hume had argued for a sort of associationism to explain how we arrive at causal beliefs. My idea of a moving cue ball, becomes associated with my idea of the eight ball that is struck and falls into the pocket. Under the right circumstances, repeated impressions of the second following the first produces a belief in me that the first *causes* the second.

The problem that Kant points out is that a Humean association of ideas already presupposes that we can conceive of identical, persistent objects that have regular, predictable, causal behavior. And being able to conceive of objects in this rich sense presupposes that the mind makes several a priori contributions. I must be able to separate the objects from each other in my sensations, and from my sensations of myself. I must be able to attribute properties to the objects. I must be able to conceive of an external world with its own course of events that is separate from the stream of perceptions in my consciousness. These components of experience cannot be found in experience because they constitute it. The mind's a priori conceptual contribution to experience can be enumerated by a special set of concepts that make all other empirical concepts and judgments possible. These concepts cannot be experienced directly; they are only manifest as the form which particular judgments of objects take. Kant believes that formal logic has already revealed what the fundamental categories of thought are. The special set of concepts is Kant's **Table of Categories**, which are taken mostly from Aristotle with a few revisions:

Of Quantity

Unity

Plurality

Totality

Of Quality

Reality

Negation

Limitation

Of Relation

Inherence and Subsistence

Causality and Dependence

Community

Of Modality

Possibility-Impossibility

Existence-Nonexistence

Necessity-Contingency

While Kant does not give a formal derivation of it, he believes that this is the complete and necessary list of the a priori contributions that the understanding brings to its judgments of the world. Every judgment that the understanding can make must fall under the table of categories. And subsuming spatiotemporal sensations under the formal structure of the categories makes judgments, and ultimately knowledge, of empirical objects possible.

Since objects can only be experienced spatiotemporally, the only application of concepts that yields knowledge is to the empirical, spatiotemporal world. Beyond that realm, there can be no sensations of objects for the understanding to judge, rightly or wrongly. Since intuitions of the physical world are lacking when we speculate about what lies beyond, metaphysical knowledge, or knowledge of the world outside the physical, is impossible. Claiming to have knowledge from the application of concepts beyond the bounds of sensation results in the empty and illusory **transcendent metaphysics** of Rationalism that Kant reacts against.

It should be pointed out, however, that Kant is not endorsing an idealism about objects like Berkeley's. That is, Kant does not believe that material objects are unknowable or impossible. While Kant is a transcendental idealist--he believes the nature of objects as they are in themselves is unknowable to us--knowledge of appearances is nevertheless possible. As noted above, in The Refutation of Material Idealism, Kant argues that the ordinary self-consciousness that Berkeley and Descartes would grant implies "the existence of objects in space outside me." (B 275) Consciousness of myself would not be possible if I were not able to make determinant judgments about objects that exist outside of me and have states that are independent of the of my inner experience. Another way to put the point is to say that the fact that the mind of the knower makes the a priori contribution does not mean that space and time or the categories are mere figments of the imagination. Kant is an **empirical realist** about the world we experience; we can know objects as they appear to us. He gives a robust defense of science and the study of the natural world from his argument about the mind's role in making nature. All discursive, rational beings must conceive of the physical world as spatially and temporally unified, he argues. And the table of categories is derived from the most basic, universal forms of logical inference, Kant believes. Therefore, it

must be shared by all rational beings. So those beings also share judgments of an intersubjective, unified, public realm of empirical objects. Hence, objective knowledge of the scientific or natural world is possible. Indeed, Kant believes that the examples of Newton and Galileo show it is actual. So Berkeley's claims that we do not know objects outside of us and that such knowledge is impossible are both mistaken.

In conjunction with his analysis of the possibility of knowing empirical objects, Kant gives an analysis of the knowing subject that has sometimes been called his **transcendental psychology**. Much of Kant's argument can be seen as subjective, not because of variations from mind to mind, but because the source of necessity and universality is in the mind of the knowing subject, not in objects themselves. Kant draws several conclusions about what is necessarily true of any consciousness that employs the faculties of sensibility and understanding to produce empirical judgments. As we have seen, a mind that employs concepts must have a receptive faculty that provides the content of judgments. Space and time are the necessary forms of apprehension for the receptive faculty. The mind that has experience must also have a faculty of combination or **synthesis**, the **imagination** for Kant, that apprehends the data of sense, reproduces it for the understanding, and recognizes their features according to the conceptual framework provided by the categories. The mind must also have a faculty of **understanding** that provides empirical concepts and the categories for judgment. The various faculties that make judgment possible must be unified into one mind. And it must be identical over time if it is going to apply its concepts to objects over time. Kant here addresses Hume's famous assertion that introspection reveals nothing more than a bundle of sensations that we group together and call the self. Judgments would not be possible, Kant maintains, if the mind that senses is not the same as the mind that possesses the forms of sensibility. And that mind must be the same as the mind that employs the table of categories, that contributes empirical concepts to judgment, and that synthesizes the whole into knowledge of a unified, empirical world. So the fact that we can empirically judge proves, contra Hume, that the mind cannot be a mere bundle of disparate introspected sensations. In his works on ethics Kant will also argue that this mind is the source of spontaneous, free, and moral action. Kant believes that all the threads of his transcendental philosophy come together in this "highest point" which he calls the **transcendental unity of apperception.**

Kant's Analytic of Principles

We have seen the progressive stages of Kant's analysis of the faculties of the mind which reveals the transcendental structuring of experience performed by these faculties. First, in his analysis of **sensibility**, he argues for the necessarily spatiotemporal character of sensation. Then Kant analyzes the **understanding**, the faculty that applies concepts to sensory experience. He concludes that the categories provide a necessary, foundational template for our concepts to map onto our experience. In addition to providing these transcendental concepts, the understanding also is the source of ordinary empirical concepts that make judgments about objects possible. The understanding provides concepts as the rules for identifying the properties in our representations.

Kant's next concern is with the faculty of judgment, "If understanding as such is explicated as our power of rules, then the power of judgment is the ability to subsume under rules, i.e., to distinguish whether something does or does not fall under a given rule." (A 132/B 172). The next stage in Kant's project will be to analyze the formal or transcendental features of experience that enable judgment, if there are any such features besides what the previous stages have identified. The cognitive power of judgment does have a transcendental structure. Kant argues that there are a number of principles that must necessarily be true of experience in order for judgment to be possible. Kant's analysis of judgment and the arguments for these principles are contained in his **Analytic of Principles**.

Within the Analytic, Kant first addresses the challenge of subsuming particular sensations under general categories in the **Schematism** section. *Transcendental schemata*, Kant argues, allow us to identify the homogeneous features picked out by concepts from the heterogeneous content of our sensations. Judgment is only possible if the mind can recognize the components in the diverse and disorganized data of sense that make those sensations an instance of a concept or concepts. A schema makes it possible, for instance, to subsume the concrete and particular sensations of an Airedale, a Chihuahua, and a Labrador all under the more abstract concept "dog."

The full extent of Kant's Copernican revolution becomes even more clear in the rest of the Analytic of Principles. That is, the role of the mind in making nature is not limited to space, time, and the categories. In the Analytic of Principles, Kant argues that even the necessary conformity of objects to natural law arises from the mind. Thus far, Kant's transcendental method has permitted him to reveal the a priori components of sensations, the a priori concepts. In the sections titled the Axioms, Anticipations, Analogies, and Postulates, he argues that there are a priori judgments that must necessarily govern all appearances of objects. These judgments are a function of the table of categories' role in determining all possible judgments, so the four sections map onto the four headings of that table. I include all of the a priori judgments, or principles, here to illustrate the earlier claims about Kant's empirical realism, and to show the intimate relationship Kant saw between his project and that of the natural sciences:

Axioms of Intuition

All intuitions are extensive magnitudes.

Anticipations of Perception

In all appearances the real that is an object of sensation has intensive magnitude, i.e., a degree.

Analogies of Experience

In all variations by appearances substance is permanent, and its quantum in nature is neither increased nor decreased.

All changes occur according to the law of the connection of cause and effect.

All substances, insofar as they can be perceived in space as simultaneous, are in thoroughgoing interaction.

Postulates of Empirical Thought

What agrees (in terms of intuition and concepts) with the formal conditions of experience is possible.

What coheres with the material conditions of experience (with sensation) is actual.

That whose coherence with the actual is determined according to universal conditions of experience is necessary (exists necessarily)

Kant's Dialectic

The discussion of Kant's metaphysics and epistemology so far (including the Analytic of Principles)has been confined primarily to the section of the *Critique of Pure Reason* that Kant calls the **Transcendental Analytic**. The purpose of the Analytic, we are told, is "the rarely attempted dissection of the power of the understanding itself." (A 65/B 90). Kant's project has been to develop the full argument for his theory about the mind's contribution to knowledge of the world. Once that theory is in place, we are in a position to see the errors that are caused by transgressions of the boundaries to knowledge established by Kant's transcendental idealism and empirical realism. Kant calls judgments that pretend to have knowledge beyond these boundaries and that even require us to tear down the limits that he has placed on knowledge, **transcendent judgments.** The **Transcendental Dialectic** section of the book is devoted to uncovering the illusion of knowledge created by transcendent judgments and explaining why the temptation to believe them persists. Kant argues that the proper functioning of the faculties of sensibility and the understanding combine to draw reason, or the cognitive power of inference, inexorably into mistakes. The faculty of reason naturally seeks the highest ground of unconditional unity. It seeks to unify and subsume all particular experiences under higher and higher principles of knowledge. But sensibility cannot by its nature provide the intuitions that would make knowledge of the highest principles and of things as they are in themselves possible. Nevertheless, reason, in its function as the faculty of inference, inevitably draws conclusions about what lies beyond the boundaries of sensibility. The unfolding of this conflict between the faculties reveals more about the mind's relationship to the world it seeks to know and the possibility of a science of metaphysics.

Kant believes that Aristotle's logic of the **syllogism** captures the logic employed by reason. The resulting mistakes from the inevitable

conflict between sensibility and reason reflect the logic of Aristotle's **syllogism.** Corresponding to the three basic kinds of syllogism are three dialectic mistakes or illusions of transcendent knowledge that cannot be real. Kant's discussion of these three classes of mistakes are contained in the **Paralogisms,** the **Antinomies,** and the **Ideals of Reason**. The Dialectic explains the illusions of reason in these sections. But since the illusions arise from the structure of our faculties, they will not cease to have their influence on our minds any more than we can prevent the moon from seeming larger when it is on the horizon than when it is overhead. (A 297/B 354).

In the **Paralogisms**, Kant argues that a failure to recognize the difference between appearances and things in themselves, particularly in the case of the introspected self, lead us into transcendent error. Kant argues against several conclusions encouraged by Descartes and the rational psychologists, who believed they could build human knowledge from the "I think" of the *cogito* argument. From the "I think" of self-awareness we can infer, they maintain, that the self or soul is 1) simple, 2) immaterial, 3) an identical substance and 4) that we perceive it directly, in contrast to external objects whose existence is merely possible. That is, the rational psychologists claimed to have knowledge of the self as transcendentally real. Kant believes that it is impossible to demonstrate any of these four claims, and that the mistaken claims to knowledge stem from a failure to see the real nature of our apprehension of the "I." Reason cannot fail to apply the categories to its judgments of the self, and that application gives rise to these four conclusions about the self that correspond roughly to the four headings in the table of categories. But to take the self as an object of knowledge here is to pretend to have knowledge of the self as it is in itself, not as it appears to us. Our representation of the "I" itself is empty. It is subject to the condition of inner sense, time, but not the condition of outer sense, space, so it cannot be a proper object of knowledge. It can be *thought* through concepts, but without the commensurate *spatial* and temporal intuitions, it cannot be known. Each of the four paralogisms explains the categorical structure of reason that led the rational psychologists to mistake the self as it appears to us for the self as it is in itself.

We have already mentioned the **Antinomies**, in which Kant analyzes the methodological problems of the Rationalist project. Kant sees the Antinomies as the unresolved dialogue between skepticism and dogmatism about knowledge of the world. There are four antinomies, again corresponding to the four headings of the table of categories, that are generated by reason's attempts to achieve complete knowledge of the realm beyond the empirical. Each antinomy has a thesis and an antithesis, both of which can be validly proven, and since each makes a claim that is beyond the grasp of spatiotemporal sensation, neither can be confirmed or denied by experience. The First Antinomy argues both that the world has a beginning in time and space, and no beginning in time and space. The Second Antinomy's arguments are that every composite substance is made of simple parts and that nothing is composed of simple parts. The Third Antinomy's thesis is that agents like ourselves have freedom and its antithesis is that they do not. The Fourth Antinomy contains arguments both for and against the existence of a necessary being in the world. The seemingly irreconcilable claims of the Antinomies can only be resolved by seeing them as the product of the conflict of the faculties and by recognizing the proper sphere of our knowledge in each case. In each of them, the idea of "absolute totality, which holds only as a condition of things in themselves, has been applied to appearances" (A 506/B534).

The result of Kant' analysis of the Antinomies is that we can reject both claims of the first two and accept both claims of the last two, if we understand their proper domains. In the first Antinomy, the world as it appears to us is neither finite since we can always inquire about its beginning or end, nor is it infinite because finite beings like ourselves cannot cognize an infinite whole. As an empirical object, Kant argues, it is indefinitely constructible for our minds. As it is in itself, independent of the conditions of our thought, should not be identified as finite or infinite since both are categorial conditions of our thought. Kant's resolution of the third Antinomy (A 445/B 473) clarifies his position on freedom. He considers the two competing hypotheses of speculative metaphysics that there are different types of causality in the world: 1) there are natural causes which are themselves governed by the laws of nature as well as uncaused causes like ourselves that can act freely, or 2) the causal laws of nature entirely govern the world including our actions. The conflict between these contrary claims can be resolved, Kant argues, by taking his critical turn and recognizing that it is impossible for any cause to be thought of as uncaused itself in the realm of space and time. But reason, in trying to understand the ground of all things, strives to unify its knowledge beyond the empirical realm. The empirical world, considered by itself, cannot provide us with ultimate reasons. So if we do not assume a first or free cause we cannot completely explain causal series in the world. So for the Third Antinomy, as for all of the Antinomies, the domain of the Thesis is the intellectual, rational, noumenal world. The domain of the Antithesis is the spatiotemporal world.

The Ideas of Reason

The faculty of reason has two employments. For the most part, we have engaged in an analysis of theoretical reason which has determined the limits and requirements of the employment of the faculty of reason to obtain knowledge. Theoretical reason, Kant says, makes it possible to cognize what is. But reason has its practical employment in determining what ought to be as well. (A 633/B 661) This distinction roughly corresponds to the two philosophical enterprises of metaphysics and ethics. Reason's practical use is manifest in the regulative function of certain concepts that we must think with regard to the world, even though we can have no knowledge of them.

Kant believes that, "Human reason is by its nature architectonic." (A 474/B 502). That is, reason thinks of all cognitions as belonging to a unified and organized system. Reason is our faculty of making inferences and of identifying the grounds behind every truth. It allows us to move from the particular and contingent to the global and universal. I infer that "Caius is mortal" from the fact that "Caius is a man" and the universal claim, "All men are mortal." In this fashion, reason seeks higher and higher levels of generality in order to explain the way things are. In a different kind of example, the biologist's classification of every living thing into a kingdom, phylum, class, order, family, genus, and species, illustrates reason's ambition to subsume the world into an ordered, unified system. The entire empirical world, Kant argues, must be conceived of by reason as causally necessitated (as we saw in the Analogies). We must connect, "one state with a previous state upon which the state follows according to a rule." Each cause, and each cause's cause, and each additional ascending cause must itself have a cause. Reason generates this hierarchy that combines to provide the mind with a conception of a whole system of nature. Kant believes that it is part of the function of reason to strive for a complete, determinate understanding of the natural world. But our analysis of theoretical reason has made it clear that we can never have knowledge of the totality of things because we cannot have the requisite sensations of the totality, hence one of the necessary conditions of knowledge is not met. Nevertheless, reason seeks a state of rest from the regression of conditioned, empirical judgments in some unconditioned ground that can complete the series (A 584/B 612). Reason's structure pushes us to accept certain *ideas of reason* that allow completion of its striving for unity. We must assume the ideas of **God, freedom,** and **immortality**, Kant says, not as objects of knowledge, but as practical necessities for the employment of reason in the realm where we can have knowledge. By denying the possibility of knowledge of these ideas, yet arguing for their role in the system of reason, Kant had to, "annul knowledge in order to make room for faith." (B xxx).

Kant's Ethics

It is rare for a philosopher in any era to make a significant impact on any single topic in philosophy. For a philosopher to impact as many different areas as Kant did is extraordinary. His ethical theory has been as, if not more, influential than his work in epistemology and metaphysics. Most of Kant's work on ethics is presented in two works. *The Foundations of the Metaphysics of Morals* (1785) is Kant's "search for and establishment of the supreme principle of morality." In *The Critique of Practical Reason* (1787) Kant attempts to unify his account of practical reason with his work in the *Critique of Pure Reason*. Kant is the primary proponent in history of what is called deontological ethics. Deontology is the study of duty. On Kant's view, the sole feature that gives an action moral worth is not the outcome that is achieved by the action, but the motive that is behind the action. The categorical imperative is Kant's famous statement of this duty: "Act only according to that maxim by which you can at the same time will that it should become a universal law."

Reason and Freedom

For Kant, as we have seen, the drive for total, systematic knowledge in reason can only be fulfilled with assumptions that empirical observation cannot support. The metaphysical facts about the ultimate nature of things in themselves must remain a mystery to us because of the spatiotemporal constraints on sensibility. When we think about the nature of things in themselves or the ultimate ground of the empirical world, Kant has argued that we are still constrained to think through the categories, we cannot think otherwise, but we can have no knowledge because sensation provides our concepts with no content. So, reason is put at odds with itself because it is constrained by the limits of its transcendental structure, but it seeks to have complete knowledge that would take it beyond those limits.

Freedom plays a central role in Kant's ethics because the possibility of moral judgments presupposes it. Freedom is an idea of reason that serves an indispensable practical function. Without the assumption of freedom, reason cannot act. If we think of ourselves as completely causally determined, and not as uncaused causes ourselves, then any attempt to conceive of a rule that prescribes the means by which some end can be achieved is pointless. I cannot both think of myself as entirely subject to causal law and as being able to act according to the conception of a principle that gives guidance to my will. We cannot help but think of our actions as the result of an uncaused cause if we are to act at all and employ reason to accomplish ends and understand the world.

So reason has an unavoidable interest in thinking of itself as free. That is, theoretical reason cannot demonstrate freedom, but practical reason must assume for the purpose of action. Having the ability to make judgments and apply reason puts us outside that system of causally necessitated events. "Reason creates for itself the idea of a spontaneity that can, on its own, start to act--without, i.e., needing to be preceded by another cause by means of which it is determined to action in turn, according to the law of causal connection," Kant says. (A 533/B 561) In its intellectual domain, reason must think of itself as free.

It is dissatisfying that he cannot demonstrate freedom, nevertheless, it comes as no surprise that we must think of ourselves as free. In a sense, Kant is agreeing with the common sense view that how I choose to act makes a difference in how I actually act. Even if it

were possible to give a predictive empirical account of why I act as I do, say on the grounds of a functionalist psychological theory, those considerations would mean nothing to me in my deliberations. When I make a decision about what to do, about which car to buy, for instance, the mechanism at work in my nervous system makes no difference *to me*. I still have to peruse *Consumer Reports*, consider my options, reflect on my needs, and decide on the basis of the application of general principles. My first person perspective is unavoidable, hence the deliberative, intellectual process of choice is unavoidable.

The Duality of the Human Situation

The question of moral action is not an issue for two classes of beings, according to Kant. The animal consciousness, the purely sensuous being, is entirely subject to causal determination. It is part of the causal chains of the empirical world, but not an originator of causes the way humans are. Hence, rightness or wrongness, as concepts that apply to situations one has control over, do not apply. We do not morally fault the lion for killing the gazelle, or even for killing its own young. The actions of a purely rational being, by contrast, are in perfect accord with moral principles, Kant says. There is nothing in such a being's nature to make it falter. Its will always conforms with the dictates of reason. Humans are between the two worlds. We are both sensible and intellectual, as was pointed out in the discussion of the first *Critique*. We are neither wholly determined to act by natural impulse, nor are we free of non-rational impulse. Hence we need rules of conduct. We need, and reason is compelled to provide, a principle that declares how we ought to act when it is in our power to choose

Since we find ourselves in the situation of possessing reason, being able to act according to our own conception of rules, there is a special burden on us. Other creatures are *acted upon* by the world. But having the ability to choose the principle to guide our actions makes us *actors*. We must exercise our will and our reason to act. Will is the capacity to act according to the principles provided by reason. Reason assumes freedom and conceives of principles of action in order to function.

Two problems face us however. First, we are not wholly rational beings, so we are liable to succumb to our non-rational impulses. Second, even when we exercise our reason fully, we often cannot know which action is the best. The fact that we can choose between alternate courses of actions (we are not determined to act by instinct or reason) introduces the possibility that there can be better or worse ways of achieving our ends and better or worse ends, depending upon the criteria we adopt. The presence of two different kinds of object in the world adds another dimension, a moral dimension, to our deliberations. Roughly speaking, we can divide the world into beings with reason and will like ourselves and things that lack those faculties. We can think of these classes of things as ends-in-themselves and mere means-to-ends, respectively. Ends-in-themselves are autonomous beings with their own agendas; failing to recognize their capacity to determine their own actions would be to thwart their freedom and undermine reason itself. When we reflect on alternative courses of action, means-to-ends, things like buildings, rocks, and trees, deserve no special status in our deliberations about what goals we should have and what means we use to achieve them. The class of ends-in-themselves, reasoning agents like ourselves, however, do have a special status in our considerations about what goals we should have and the means we employ to accomplish them. Moral actions, for Kant, are actions where reason leads, rather than follows, and actions where we must take other beings that act according to their own conception of the law, into account.

The Good Will

The will, Kant says, is the faculty of acting according to a conception of law. When we act, whether or not we achieve what we intend with our actions is often beyond our control, so the morality of our actions does not depend upon their outcome. What we can control, however, is the will behind the action. That is, we can will to act according to one law rather than another. The morality of an action, therefore, must be assessed in terms of the motivation behind it. If two people, Smith and Jones, perform the same act, from the same conception of the law, but events beyond Smith's control prevent her from achieving her goal, Smith is not less praiseworthy for not succeeding. We must consider them on equal moral ground in terms of the will behind their actions.

The only thing that is good without qualification is the good will, Kant says. All other candidates for an intrinsic good have problems, Kant argues. Courage, health, and wealth can all be used for ill purposes, Kant argues, and therefore cannot be intrinsically good. Happiness is not intrinsically good because even being worthy of happiness, Kant says, requires that one possess a good will. The good will is the only unconditional good despite all encroachments. Misfortune may render someone incapable of achieving her goals, for instance, but the goodness of her will remains.

Goodness cannot arise from acting on impulse or natural inclination, even if impulse coincides with duty. It can only arise from conceiving of one's actions in a certain way. A shopkeeper, Kant says, might do what is in accord with duty and not overcharge a child. Kant argues, "it is not sufficient to do that which should be morally good that it conform to the law; it must be done for the sake of the law." (*Foundations of the Metaphysics of Morals*, *Akademie pagination* 390) There is a clear moral difference between the shopkeeper that does it for his own advantage to keep from offending other customers and the shopkeeper who does it from duty and

the principle of honesty.(*Ibid.*, 398) Likewise, in another of Kant's carefully studied examples, the kind act of the person who overcomes a natural lack of sympathy for other people out of respect for duty has moral worth, whereas the same kind act of the person who naturally takes pleasure in spreading joy does not. A person's moral worth cannot be dependent upon what nature endowed them with accidentally. The selfishly motivated shopkeeper and the naturally kind person both act on equally subjective and accidental grounds. What matters to morality is that the actor think about their actions in the right manner.

We might be tempted to think that the motivation that makes an action good is having a positive goal--to make people happy, or to provide some benefit. But that is not the right sort of motive, Kant says. No outcome, should we achieve it, can be unconditionally good. Fortune can be misused, what we thought would induce benefit might actually bring harm, and happiness might be undeserved. Hoping to achieve some particular end, no matter how beneficial it may seem, is not purely and unconditionally good. It is not the effect or even the intended effect that bestows moral character on an action. All intended effects "could be brought about through other causes and would not require the will of a rational being, while the highest and unconditional good can be found only in such a will." (*Ibid.*, 401) It is the possession of a rationally guided will that adds a moral dimension to one's acts. So it is the recognition and appreciation of duty itself that must drive our actions.

Duty

What is the duty that is to motivate our actions and to give them moral value? Kant distinguishes two kinds of law produced by reason. Given some end we wish to achieve, reason can provide a **hypothetical imperative**, or rule of action for achieving that end. A hypothetical imperative says that *if* you wish to buy a new car, *then* you must determine what sort of cars are available for purchase. Conceiving of a means to achieve some desired end is by far the most common employment of reason. But Kant has shown that the acceptable conception of the moral law cannot be merely hypothetical. Our actions cannot be moral on the ground of some conditional purpose or goal. Morality requires an unconditional statement of one's duty.

And in fact, reason produces an absolute statement of moral action. The moral imperative is unconditional; that is, its imperative force is not tempered by the conditional "*if* I want to achieve some end, *then* do X." It simply states, do X. Kant believes that reason dictates a **categorical imperative** for moral action. He gives at least three formulations of the Categorical Imperative.

1. "Act only according to that maxim by which you can at the same time will that it should become a universal law." (*Ibid.*, 422)
2. "Act as though the maxim of your action were by your will to become a universal law of nature." (*Ibid*)
3. Act so that you treat humanity, whether in your own person or in that of another, always as an end and never as a means only." (*Ibid.*, 429)

What are Kant's arguments for the Categorical Imperative? First, consider an example. Consider the person who needs to borrow money and is considering making a false promise to pay it back. The maxim that could be invoked is, "when I need of money, borrow it, promising to repay it, even though I do not intend to." But when we apply the universality test to this maxim it becomes clear that if everyone were to act in this fashion, the institution of promising itself would be undermined. The borrower makes a promise, willing that there be no such thing as promises. Thus such an action fails the universality test.

The argument for the first formulation of the categorical imperative can be thought of this way. We have seen that in order to be good, we must remove inclination and the consideration of any particular goal from our motivation to act. The act cannot be good if it arises from subjective impulse. Nor can it be good because it seeks after some particular goal which might not attain the good we seek or could come about through happenstance. We must abstract away from all hoped for effects. If we remove all subjectivity and particularity from motivation we are only left with will to universality. The question "what rule determines what I ought to do in this situation?" becomes "what rule ought to universally guide action?" What we must do in any situation of moral choice is act according to a maxim that we would will everyone to act according to.

The second version of the Categorical Imperative invokes Kant's conception of nature and draws on the first *Critique*. In the earlier discussion of nature, we saw that the mind necessarily structures nature. And reason, in its seeking of ever higher grounds of explanation, strives to achieve unified knowledge of nature. A guide for us in moral matters is to think of what would not be possible to will universally. Maxims that fail the test of the categorical imperative generate a contradiction. Laws of nature cannot be contradictory. So if a maxim cannot be willed to be a law of nature, it is not moral.

The third version of the categorical imperative ties Kant's whole moral theory together. Insofar as they possess a rational will, people are set off in the natural order of things. They are not merely subject to the forces that act upon them; they are not merely means to ends. They are ends in themselves. All means to an end have a merely conditional worth because they are valuable only for achieving something else. The possessor of a rational will, however, is the only thing with unconditional worth. The possession of rationality puts all beings on the same footing, "every other rational being thinks of his existence by means of the same rational ground which holds also for myself; thus it is at the same time an objective principle from which, as a supreme practical ground, it must be possible

to derive all laws of the will." (*Ibid.*, 429)

Kant's Criticisms of Utilitarianism

Kant's criticisms of utilitarianism have become famous enough to warrant some separate discussion. Utilitarian moral theories evaluate the moral worth of action on the basis of happiness that is produced by an action. Whatever produces the most happiness in the most people is the moral course of action. Kant has an insightful objection to moral evaluations of this sort. The essence of the objection is that utilitarian theories actually devalue the individuals it is supposed to benefit. If we allow utilitarian calculations to motivate our actions, we are allowing the valuation of one person's welfare and interests in terms of what good they can be used for. It would be possible, for instance, to justify sacrificing one individual for the benefits of others if the utilitarian calculations promise more benefit. Doing so would be the worst example of treating someone utterly as a means and not as an end in themselves.

Another way to consider his objection is to note that utilitarian theories are driven by the merely contingent inclination in humans for pleasure and happiness, not by the universal moral law dictated by reason. To act in pursuit of happiness is arbitrary and subjective, and is no more moral than acting on the basis of greed, or selfishness. All three emanate from subjective, non-rational grounds. The danger of utilitarianism lies in its embracing of baser instincts, while rejecting the indispensable role of reason and freedom in our actions.

Philosophy of Law

Philosophers of law are concerned with providing a general philosophical analysis of law and legal institutions. Issues in legal philosophy range from abstract conceptual questions about the nature of law and legal systems to normative questions about the relation between law and morality and the justification for various legal institutions. Topics in legal philosophy tend to be more abstract than related topics in political philosophy and applied ethics. For example, whereas the question of how properly to interpret the U.S. Constitution belongs to democratic theory and hence falls under the heading of political philosophy, the analysis of legal interpretation falls under the heading of legal philosophy. Likewise, whereas the question of whether capital punishment is morally permissible falls under the heading of applied ethics, the question of whether the institution of punishment can be justified falls under the heading of legal philosophy. Topics in legal philosophy fall roughly into three categories: analytic jurisprudence, normative jurisprudence, and critical theories of law.

I. **Analytic Jurisprudence**

The principal objective of analytic jurisprudence has traditionally been to provide an account of what distinguishes law as a system of norms from other systems of norms, such as ethical norms. As John Austin describes the project, analytic jurisprudence seeks "the essence or nature which is common to all laws that are properly so called" (Austin 1995, p. 11). Accordingly, analytic jurisprudence is concerned with providing necessary and sufficient conditions for the existence of law that distinguishes law from non-law in every possible world.

While this task is usually interpreted as an attempt to analyze the concepts of law and legal system, there is some confusion as to both the value and character of conceptual analysis in philosophy of law. As Brian Leiter (1998) points out, philosophy of law is one of the few philosophical disciplines that takes conceptual analysis as its principal concern; most other areas in philosophy have taken a naturalistic turn, incorporating the tools and methods of the sciences. To clarify the role of conceptual analysis in law, Brian Bix (1995) distinguishes a number of different purposes that can be served by conceptual claims: (1) to track linguistic usage; (2) to stipulate meanings; (3) to explain what is important or essential about a class of objects; and (4) to establish an evaluative test for the concept-word. Bix takes conceptual analysis in law to be primarily concerned with (3) and (4).

In any event, conceptual analysis of law remains an important, if controversial, project in contemporary legal theory. Conceptual theories of law can be divided into two main headings: those that affirm there is a conceptual relation between law and morality and those that deny that there is such a relation. Nevertheless, Ronald Dworkin's view is often characterized as a third theory partly because it is not clear where he stands on the question of whether there is a conceptual relation between law and morality.

I.1. **Natural Law Theory**

All forms of natural law theory subscribe to the Overlap Thesis, which asserts that there is a necessary relation between the concepts of law and morality. According to this view, then, the concept of law

cannot be fully articulated without some reference to moral notions. Though the Overlap Thesis may seem unambiguous, there are a number of different ways in which it can be interpreted.

The strongest form of the Overlap Thesis underlies the classical naturalism of Aquinas and Blackstone. As Blackstone describes the thesis, "This law of nature, being co-eval with mankind and dictated by God himself, is of course superior in obligation to any other. It is binding over all the globe, in all countries, and at all times: no human laws are of any validity, if contrary to this; and such of them as are valid derive all their force, and all their authority, mediately or immediately, from this original" (1979, p. 41). In this passage, Blackstone articulates the two claims that constitute the theoretical core of classical naturalism: 1) there can be no legally valid standards that conflict with the natural law; and 2) all valid laws derive what force and authority they have from the natural law. On this view, to paraphrase Augustine, an unjust law is no law at all.

Related to Blackstone's classical naturalism is the neo-naturalism of John Finnis (1980). Finnis believes that the naturalism of Aquinas and Blackstone should not be construed as a conceptual account of the existence conditions for law. According to Finnis (see also Bix, 1996), the classical naturalists were not concerned with giving a conceptual account of legal validity; rather they were concerned with explaining the moral force of law: "the principles of natural law explain the obligatory force (in the fullest sense of 'obligation') of positive laws, even when those laws cannot be deduced from those principles" (Finnis 1980, pp. 23-24). On Finnis's view of the Overlap Thesis, the essential function of law is to provide a justification for state coercion. Accordingly, an unjust law can be legally valid, but cannot provide an adequate justification for use of the state coercive power and is hence not obligatory in the fullest sense; thus, an unjust law fails to realize the moral ideals implicit in the concept of law. An unjust law, on this view, is legally binding, but is not fully law.

Lon Fuller (1964) rejects the idea that there are necessary moral constraints on the content of law. On Fuller's view, law is necessarily subject to a *procedural* morality consisting of eight principles: (P1) the rules must be expressed in general terms; (P2) the rules must be publicly promulgated; (P3) the rules must be prospective in effect; (P4) the rules must be expressed in understandable terms; (P5) the rules must be consistent with one another; (P6) the rules must not require conduct beyond the powers of the affected parties; (P7) the rules must not be changed so frequently that the subject cannot rely on them; and (P8) the rules must be administered in a manner consistent with their wording.

On Fuller's view, no system of rules that fails minimally to satisfy these principles of legality can achieve law's essential purpose of achieving social order through the use of rules that guide behavior. A system of rules that fails to satisfy (P2) or (P4), for example, cannot guide behavior because people will not be able to determine what the rules require. Accordingly, Fuller concludes that his eight principles are "internal" to law in the sense that they are built into the existence conditions for law: "A total failure in any one of these eight directions does not simply result in a bad system of law; it results in something that is not properly called a legal system at all" (1964, p. 39).

I.2 **Legal Positivism**

Opposed to all forms of naturalism is legal positivism, which is roughly constituted by three theoretical commitments: the Social Fact Thesis, the Conventionality Thesis, and the Separability Thesis. The Social Fact Thesis (which is also known as the Pedigree Thesis) asserts that it is a necessary truth that legal validity is ultimately a function of certain kinds of social facts. The Conventionality Thesis emphasizes law's conventional nature, claiming that the social facts giving rise to legal validity are authoritative in virtue of some kind of social convention. The Separability Thesis, at the most general level, simply denies naturalism's Overlap Thesis; according to the Separability Thesis, there is no conceptual overlap

between the notions of law and morality.

I.2.1 The Conventionality Thesis

According to the Conventionality Thesis, it is a conceptual truth about law that legal validity can ultimately be explained in terms of criteria that are authoritative in virtue of some kind of social convention. Thus, for example, H.L.A. Hart (1996) believes the criteria of legal validity are contained in a rule of recognition that sets forth rules for creating, changing, and adjudicating law. On Hart's view, the rule of recognition is authoritative in virtue of a convention among officials to regard its criteria as standards that govern their behavior as officials. While Joseph Raz does not appear to endorse Hart's view about a master rule of recognition containing the criteria of validity, he also believes the validity criteria are authoritative only in virtue of a convention among officials.

I.2.2 The Social Fact Thesis

The Social Fact Thesis asserts that legal validity is a function of certain social facts. Borrowing heavily from Jeremy Bentham, John Austin (1995) argues that the principal distinguishing feature of a legal system is the presence of a sovereign who is habitually obeyed by most people in the society, but not in the habit of obeying any determinate human superior. On Austin's view, a rule R is legally valid (i.e., is a law) in a society S if and only if R is commanded by the sovereign in S and is backed up with the threat of a sanction. The relevant social fact that confers validity, on Austin's view, is promulgation by a sovereign willing to impose a sanction for noncompliance.

Hart takes a different view of the Social Fact Thesis. Hart believes that Austin's theory accounts, at most, for one kind of rule: primary rules that require or prohibit certain kinds of behavior. On Hart's view, Austin overlooked the presence of other primary rules that confer upon citizens the power to create, modify, and extinguish rights and obligations in other persons. As Hart points out, the rules governing the creation of contracts and wills cannot plausibly be characterized as restrictions on freedom that are backed by the threat of a sanction.

Most importantly, however, Hart argues Austin overlooks the existence of secondary meta-rules that have as their subject matter the primary rules themselves and distinguish full-blown legal systems from primitive systems of law:

> [Secondary rules] may all be said to be on a different level from the primary rules, for they are all *about* such rules; in the sense that while primary rules are concerned with the actions that individuals must or must not do, these secondary rules are all concerned with the primary rules themselves. They specify the way in which the primary rules may be conclusively ascertained, introduced, eliminated, varied, and the fact of their violation conclusively determined (Hart 1994, p. 92).

Hart distinguishes three types of secondary rules that mark the transition from primitive forms of law to full-blown legal systems: (1) the rule of recognition, which "specif[ies] some feature or features possession of which by a suggested rule is taken as a conclusive affirmative indication that it is a rule of the group to be supported by the social pressure it exerts" (Hart 1994, p. 92); (2) the rule of change, which enables a society to add, remove, and modify valid rules; and (3) the rule of adjudication, which provides a mechanism for determining whether a valid rule has been violated. On Hart's view, then, every society with a full-blown legal system necessarily has a rule of recognition that articulates criteria for legal validity that include provisions for making, changing and adjudicating law. Law is, to use Hart's famous phrase, "the union of primary and secondary rules" (Hart 1994, p. 107).

According to Hart's view of the Social Fact Thesis, then, a proposition P is legally valid in a society S if

and only if it satisfies the criteria of validity contained in a rule of recognition that is binding in S. As we have seen, the Conventionality Thesis implies that a rule of recognition is binding in S only if there is a social convention among officials to treat it as defining standards of official behavior. Thus, on Hart's view, "[the] rules of recognition specifying the criteria of legal validity and its rules of change and adjudication must be effectively accepted as common public standards of official behaviour by its officials" (Hart 1994, p. 113).

I.2.3 The Separability Thesis

The final thesis comprising the foundation of legal positivism is the Separability Thesis. In its most general form, the Separability Thesis asserts that law and morality are conceptually distinct. This abstract formulation can be interpreted in a number of ways. For example, Klaus Füßer (1996) interprets it as making a meta-level claim that the definition of law must be entirely free of moral notions. This interpretation implies that any reference to moral considerations in defining the related notions of law, legal validity, and legal system is inconsistent with the Separability Thesis.

More commonly, the Separability Thesis is interpreted as making only an object-level claim about the existence conditions for legal validity. As Hart describes it, the Separability Thesis is no more than the "simple contention that it is in no sense a necessary truth that laws reproduce or satisfy certain demands of morality, though in fact they have often done so" (Hart 1994, pp. 181-82). Insofar as the object-level interpretation of the Separability Thesis denies it is a necessary truth that there are moral constraints on legal validity, it implies the existence of a possible legal system in which there are no moral constraints on legal validity.

Though all positivists agree there are possible legal systems without moral constraints on legal validity, there are conflicting views on whether there are possible legal systems *with* such constraints. According to inclusive positivism (also known as incorporationism and soft positivism), it is possible for a society's rule of recognition to incorporate moral constraints on the content of law. Prominent inclusive positivists include Jules Coleman and Hart, who maintains that "the rule of recognition may incorporate as criteria of legal validity conformity with moral principles or substantive values ... such as the Sixteenth or Nineteenth Amendments to the United States Constitution respecting the establishment of religion or abridgements of the right to vote" (Hart 1994, p. 250).

In contrast, exclusive positivism (also called hard positivism) denies that a legal system can incorporate moral constraints on legal validity. Exclusive positivists like Raz (1979) subscribe to the Source Thesis, according to which the existence and content of law can always be determined by reference to its sources without recourse to moral argument. On this view, the sources of law include both the circumstances of its promulgation and relevant interpretative materials, such as court cases involving its application.

I.3 **Ronald Dworkin's Third Theory**

Ronald Dworkin rejects positivism's Social Fact Thesis on the ground that there are some legal standards the authority of which cannot be explained in terms of social facts. In deciding hard cases, for example, judges often invoke moral principles that Dworkin believes do not derive their *legal* authority from the social criteria of legality contained in a rule of recognition (Dworkin 1977, p. 40). Nevertheless, since judges are bound to consider such principles when relevant, they must be characterized as law. Thus, Dworkin concludes, "if we treat principles as law we must reject the positivists' first tenet, that the law of a community is distinguished from other social standards by some test in the form of a master rule" (Dworkin 1977, p. 44).

Dworkin believes adjudication is and should be interpretive: "judges should decide hard cases by interpreting the political structure of their community in the following, perhaps special way: by trying to

find the best *justification* they can find, in principles of political morality, for the structure as a whole, from the most profound constitutional rules and arrangements to the details of, for example, the private law of tort or contract" (Dworkin 1982, p. 165). There are, then, two elements of a successful interpretation. First, since an interpretation is successful insofar as it justifies the particular practices of a particular society, the interpretation must *fit* with those practices in the sense that it coheres with existing legal materials defining the practices. Second, since an interpretation provides a *moral justification* for those practices, it must present them in the best possible moral light. Thus, Dworkin argues, a judge should strive to interpret a case in roughly the following way:

> A thoughtful judge might establish for himself, for example, a rough "threshold" of fit which any interpretation of data must meet in order to be "acceptable" on the dimension of fit, and then suppose that if more than one interpretation of some part of the law meets this threshold, the choice among these should be made, not through further and more precise comparisons between the two along that dimension, but by choosing the interpretation which is "substantively" better, that is, which better promotes the political ideals he thinks correct (Dworkin 1982, p. 171).

Accordingly, on Dworkin's view, the legal authority of a binding principle derives from the contribution it makes to the best moral justification for a society's legal practices considered as a whole. Thus, a legal principle maximally contributes to such a justification if and only if it satisfies two conditions: (1) the principle coheres with existing legal materials; and (2) the principle is the most morally attractive standard that satisfies (1). The correct legal principle is the one that makes the law the moral best it can be.

In later writings, Dworkin expands the scope of his "constructivist" view beyond adjudication to encompass the realm of legal theory. Dworkin distinguishes conversational interpretation from artistic/creative interpretation and argues that the task of interpreting a social practice is more like artistic interpretation:

> The most familiar occasion of interpretation … is conversation. We interpret the sounds or marks another person makes in order to decide what he has said…. Artistic interpretation is yet another: critics interpret poems and plays and paintings in order to defend some view of their meaning or theme or point. The form of interpretation we are studying-the interpretation of a social practice-is like artistic interpretation in this way: both aim to interpret something created by people as an entity distinct from them, rather than what people say, as in conversational interpretation" (Dworkin 1986, p. 50).

Artistic interpretation, like judicial interpretation, is constrained by the dimensions of fit and justification: "constructive interpretation is a matter of imposing purpose on an object or practice in order to make of it the best possible example of the form or genre to which it is taken to belong" (Dworkin 1986, p. 52).

On Dworkin's view, the point of any general theory of law is to interpret a very complex set of related social practices that are "created by people as an entity distinct from them"; for this reason, Dworkin believes the project of putting together a general theory of law is inherently constructivist:

> General theories of law … must be abstract because they aim to interpret the main point and structure of legal practice, not some particular part or department of it. But for all their abstraction, they are constructive interpretations: they try to show legal practice as a whole in its best light, to achieve equilibrium between legal practice as they find it and the best justification of that practice. So no firm line divides jurisprudence from adjudication or any

> other aspect of legal practice (Dworkin 1986, p. 90).

Indeed, so tight is the relation between jurisprudence and adjudication, according to Dworkin, that jurisprudence is no more than the most general part of adjudication; thus, Dworkin concludes, "any judge's opinion is itself a piece of legal philosophy" (Dworkin 1986, p. 90).

Accordingly, Dworkin rejects not only positivism's Social Fact Thesis, but also what he takes to be its underlying presuppositions about legal theory. Hart distinguishes two perspectives from which a set of legal practices can be understood. A legal practice can be understood from the "internal" point of view of the person who accepts that practice as providing legitimate guides to conduct, as well as from the "external" point of view of the observer who wishes to understand the practice but does not accept it as being authoritative or legitimate.

Hart understands his theory of law to be both descriptive and general in the sense that it provides an account of fundamental features common to all legal systems-which presupposes a point of view that is external to all legal systems. For this reason, he regards his project as "a radically different enterprise from Dworkin's conception of legal theory (or 'jurisprudence' as he often terms it) as in part evaluative and justificatory and as 'addressed to a particular legal culture', which is usually the theorist's own and in Dworkin's case is that of Anglo-American law" (Hart 1994, p. 240).

These remarks show Hart believes Dworkin's theoretical objectives are fundamentally different from those of positivism, which, as a theory of analytic jurisprudence, is largely concerned with conceptual analysis. For his part, Dworkin conceives his work as conceptual but not in the same sense that Hart regards his work:

> We all-at least all lawyers-share a concept of law and of legal right, and we contest different conceptions of that concept. Positivism defends a particular conception, and I have tried to defend a competing conception. We disagree about what legal rights are in much the same way as we philosophers who argue about justice disagree about what justice is. I concentrate on the details of a particular legal system with which I am especially familiar, not simply to show that positivism provides a poor account of that system, but to show that positivism provides a poor conception of the concept of a legal right (Dworkin 1977, 351-52).

These differences between Hart and Dworkin have led many legal philosophers, most recently Bix (1996), to suspect that they are not really taking inconsistent positions at all. Accordingly, there remains an issue as to whether Dworkin's work should be construed as falling under the rubric of analytic jurisprudence.

II. **Normative Jurisprudence**

II.1 **Freedom and the Limits of Legitimate Law**

Laws limit human autonomy by restricting freedom. Criminal laws, for example, remove certain behaviors from the range of behavioral options by penalizing them with imprisonment and, in some cases, death. Likewise, civil laws require people to take certain precautions not to injure others and to honor their contracts. Given that human autonomy deserves *prima facie* moral respect, the question arises as to what are the limits of the state's legitimate authority to restrict the freedom of its citizens.

John Stuart Mill provides the classic liberal answer in the form of the harm principle: "[T]he sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of their number is self-protection. The only purpose for which power can rightfully be exercised over any member of a civilised community against his will is to prevent harm to others. His own good, either

physical or moral, is not a sufficient warrant…. Over himself, over his own body and mind, the individual is sovereign" (Mill 1906, pp. 12-13). While Mill left the notion of harm underdeveloped, he is most frequently taken to mean only physical harms and more extreme forms of psychological harm.

Though Mill's view-or something like it-enjoys currency among the public, it has generated considerable controversy among philosophers of law and political philosophers. Many philosophers believe that Mill understates the limits of legitimate state authority over the individual, claiming that law may be used to enforce morality, to protect the individual from herself, and in some cases to protect individuals from offensive behavior.

II.1.1 *Legal Moralism*

Legal moralism is the view that the law can legitimately be used to prohibit behaviors that conflict with society's collective moral judgments even when those behaviors do not result in physical or psychological harm to others. According to this view, a person's freedom can legitimately be restricted simply because it conflicts with society's collective morality; thus, legal moralism implies that it is permissible for the state to use its coercive power to enforce society's collective morality.

The most famous legal moralist is Patrick Devlin, who argues that a shared morality is essential to the existence of a society:

> [I]f men and women try to create a society in which there is no fundamental agreement about good and evil they will fail; if, having based it on common agreement, the agreement goes, the society will disintegrate. For society is not something that is kept together physically; it is held by the invisible bonds of common thought. If the bonds were too far relaxed the members would drift apart. A common morality is part of the bondage. The bondage is part of the price of society; and mankind, which needs society, must pay its price. (Devlin 1965, p. 10).

Insofar as human beings cannot lead a meaningful existence outside of society, it follows, on Devlin's view, that the law can be used to preserve the shared morality as a means of preserving society itself.

H.L.A. Hart (1963) points out that Devlin overstates the extent to which preservation of a shared morality is necessary to the continuing existence of a society. Devlin attempts to conclude from the necessity of a shared social morality that it is permissible for the state to legislate sexual morality (in particular, to legislate against same-sex sexual relations), but Hart argues it is implausible to think that "deviation from accepted sexual morality, even by adults in private, is something which, like treason, threatens the existence of society" (Hart 1963, p. 50). While enforcement of certain social norms protecting life, safety, and property are likely essential to the existence of a society, a society can survive a diversity of behavior in many other areas of moral concern-as is evidenced by the controversies in the U.S. surrounding abortion and homosexuality.

II.1.2 *Legal Paternalism*

Legal paternalism is the view that it is permissible for the state to legislate against what Mill calls self-regarding actions when necessary to prevent individuals from inflicting physical or severe emotional harm on *themselves*. As Gerald Dworkin describes it, a paternalist interference is an "interference with a person's liberty of action justified by reasons referring exclusively to the welfare, good, happiness, needs, interests or values of the person being coerced" (G. Dworkin 1972, p. 65). Thus, for example, a law requiring use of a helmet when riding a motorcycle is a paternalistic interference insofar as it is justified by concerns for the safety of the rider.

Dworkin argues that Mill's view that a person "cannot rightfully be compelled to do or forbear because it

will be better for him" (Mill 1906, p. 13) precludes paternalistic legislation to which fully rational individuals would agree. According to Dworkin, there are goods, such as health and education, that any rational person needs to pursue her own good-no matter how that good is conceived. Thus, Dworkin concludes, the attainment of these basic goods can legitimately be promoted in certain circumstances by using the state's coercive force.

Dworkin offers a hypothetical consent justification for his limited legal paternalism. On his view, there are a number of different situations in which fully rational adults would consent to paternalistic restrictions on freedom. For example, Dworkin believes a fully rational adult would consent to paternalistic restrictions to protect her from making decisions that are "far-reaching, potentially dangerous and irreversible" (G. Dworkin 1972, p. 80). Nevertheless, he argues that there are limits to legitimate paternalism: (1) the state must show that the behavior governed by the proposed restriction involves the sort of harm that a rational person would want to avoid; (2) on the calculations of a fully rational person, the potential harm outweighs the benefits of the relevant behavior; and (3) the proposed restriction is the least restrictive alternative for protecting against the harm.

II.1.3 *The Offense Principle*

Joel Feinberg believes the harm principle does not provide sufficient protection against the wrongful behaviors of others, as it is inconsistent with many criminal prohibitions we take for granted as being justified. If the only legitimate use of the state coercive force is to protect people from harm caused by others, then statutes prohibiting public sex are impermissible because public sex might be offensive but it does not cause harm (in the Millian sense) to others.

Accordingly, Feinberg argues the harm principle must be augmented by the offense principle, which he defines as follows: "It is always a good reason in support of a proposed criminal prohibition that it would probably be an effective way of preventing serious offense (as opposed to injury or harm) to persons other than the actor, and that it is probably a necessary means to that end" (Feinberg 1985). By 'offense,' Feinberg intends a subjective and objective element: the subjective element consists in the experience of an unpleasant mental state (e.g., shame, disgust, anxiety, embarrassment); the objective element consists in the existence of a wrongful cause of such a mental state.

II.2 **The Obligation to Obey Law**

Natural law critics of positivism (e.g., Fuller 1958) frequently complain that if positivism is correct, there cannot be a moral obligation to obey the law qua law. As Feinberg (1979) puts the point:

> The positivist account of legal validity … is hard to reconcile with the [claim] … that valid law as such, no matter what its content, deserves our respect and general fidelity. Even if valid law is bad law, we have some obligation to obey it simply because it is law. But how can this be so if a law's validity has nothing to do with its content?

The idea is this: if what is essential to law is just that there exist specified recipes for making law, then there cannot be a moral obligation to obey a rule *simply because it is the law*.

Contemporary positivists, for the most part, accept the idea that positivism is inconsistent with an obligation to obey law qua law (cf. Himma 1998), but argue that the mere status of a norm as law cannot give rise to any moral obligation to obey that norm. While there might be a moral obligation to obey a particular law because of its moral content (e.g., laws prohibiting murder) or because it solves a coordination problem (e.g., laws requiring people to drive on the right side of the road), the mere fact that a rule is law does not provide a moral reason for doing what the law requires.

Indeed, arguments for the existence of even a *prima facie* obligation to obey law (i.e., an obligation that

can be outweighed by competing obligations) have largely been unsuccessful. Arguments in favor of an obligation to obey the law roughly fall into four categories: (1) arguments from gratitude; (2) arguments from fair play; (3) arguments from implied consent; and (4) arguments from general utility.

The argument from gratitude begins with the observation that all persons, even those who are worst off, derive some benefit from the state's enforcement of the law. On this view, a person who accepts benefits from another person thereby incurs a duty of gratitude towards the benefactor. And the only plausible way to discharge this duty towards the government is to obey its laws. Nevertheless, as M.B.E. Smith points out (1973, p. 953), "if someone confers benefits on me without any consideration of whether I want them, and if he does this in order to advance some purpose other than promotion of my particular welfare, I have no obligation to be grateful towards him." Since the state does not give citizens a choice with respect to such benefits, the mere enjoyment of them cannot give rise to a duty of gratitude.

John Rawls (1964) argues that there is a moral obligation to obey law qua law in societies in which there is a mutually beneficial and just scheme of social cooperation. What gives rise to a moral obligation to obey law qua law in such societies is a duty of fair play: fairness requires obedience of persons who intentionally accept the benefits made available in a society organized around a just scheme of mutually beneficial cooperation. There are a couple of problems here. First, Rawls's argument does not establish the existence of a content-independent obligation to obey law; the obligation arises only in those societies that institutionalize a just scheme of social cooperation. Second, even in such societies, citizens are not presented with a genuine option to refuse those benefits. For example, I cannot avoid the benefits of laws ensuring clean air. But accepting benefits one is not in a position to refuse cannot give rise to an obligation of fair play.

The argument from consent grounds an obligation to obey law on some sort of implied promise. As is readily evident, we can voluntarily assume obligations by consenting to them or making a promise. Of course, most citizens never explicitly promise or consent to obey the laws; for this reason, proponents of this argument attempt to infer consent from such considerations as continued residence and acceptance of benefits from the state. Nevertheless, acceptance of benefits one cannot decline no more implies consent to obey law than it does duties of fair play or gratitude. Moreover, the prohibitive difficulties associated with emigration preclude an inference of consent from continued residence.

Finally, the argument from general utility grounds the duty to obey the law in the consequences of universal disobedience. Since, according to this argument, the consequences of general disobedience would be catastrophic, it is wrong for any individual to disobey the law; for no person may disobey the law unless everyone may do so. In response, Smith points out that this strategy of argument leads to absurdities: "We will have to maintain, for example, that there is a prima facie obligation not to eat dinner at five o'clock, for if everyone did so, certain essential services could not be maintained" (Smith 1973, p. 966).

II.3 **The Justification of Punishment**

Punishment is unique among putatively legitimate acts in that its point is to inflict discomfort on the recipient; an act that is incapable of causing a person minimal discomfort cannot be characterized as a punishment. In most contexts, the commission of an act for the purpose of inflicting discomfort is morally problematic because of its resemblance to torture. For this reason, institutional punishment requires a moral justification sufficient to distinguish it from other practices of purposely inflicting discomfort on other people.

Justifications for punishment typically take five forms: (1) retributive; (2) deterrence; (3) preventive; (4) rehabilitative; and (5) restitutionary. According to the retributive justification, what justifies punishing a

person is that she committed an offense that deserves the punishment. On this view, it is morally appropriate that a person who has committed a wrongful act should suffer in proportion to the magnitude of her wrongdoing. The problem, however, is that the mere fact that someone is deserving of punishment does not imply it is morally permissible for the state to administer punishment; it would be wrong for me, for example, to punish someone else's child even though her behavior might deserve it.

In contrast to the retributivist theories that look back to a person's prior wrongful act as justification for punishment, utilitarian theories look forward to the beneficial consequences of punishing a person. There are three main lines of utilitarian reasoning. According to the deterrence justification, punishment of a wrongdoer is justified by the socially beneficial effects that it has on other persons. On this view, punishment deters wrongdoing by persons who would otherwise commit wrongful acts. The problem with the deterrence theory is that it justifies punishment of one person on the strength of the effects that it has on other persons. The idea that it is permissible to deliberately inflict discomfort on one person because doing so may have beneficial effects on the behavior of other persons appears inconsistent with the Kantian principle that it is wrong to use people as mere means.

The preventive justification argues that incarcerating a person for wrongful acts is justified insofar as it prevents that person from committing wrongful acts against society during the period of incarceration. The rehabilitative justification argues that punishment is justified in virtue of the effect that it has on the moral character of the offender. Each of these justifications suffers from the same flaw: prevention of crime and rehabilitation of the offender can be achieved without the deliberate infliction of discomfort that constitutes punishment. For example, prevention of crime might require detaining the offender, but it does not require detention in an environment that is as unpleasant as those typically found in prisons.

The restitutionary justification focuses on the effect of the offender's wrongful act on the victim. Other theories of punishment conceptualize the wrongful act as an offense against society; the restitutionary theory sees wrongdoing as an offense against the victim. Thus, on this view, the principal purpose of punishment must be to make the victim whole to the extent that this can be done: "The point is not that the offender deserves to suffer; it is rather that the offended party desires compensation" (Barnett 1977, p. 289). Accordingly, a criminal convicted of wrongdoing should be sentenced to compensate her victim in proportion to the victim's loss. The problem with the restitutionary theory is that it fails to distinguish between compensation and punishment. Compensatory objectives focus on the victim, while punitive objectives focus on the offender.

III. **Critical Theories of Law**

III.1 **Legal Realism**

The legal realist movement was inspired by John Chipman Gray and Oliver Wendall Holmes and reached its apex in the 1920s and 30s through the work of Karl Llewellyn, Jerome Frank, and Felix Cohen. The realists eschewed the conceptual approach of the positivists and naturalists in favor of an empirical analysis that sought to show how practicing judges *really* decide cases (see Leiter 1998). The realists were deeply skeptical of the ascendant notion that judicial legislation is a rarity. While not entirely rejecting the idea that judges can be constrained by rules, the realists maintained that judges create new law through the exercise of lawmaking discretion considerably more often than is commonly supposed. On their view, judicial decision is guided far more frequently by political and moral intuitions about the facts of the case (instead of by legal rules) than theories like positivism and naturalism acknowledge.

As an historical matter, legal realism arose in response to legal formalism, a particular model of legal

reasoning that assimilates legal reasoning to syllogistic reasoning. According to the formalist model, the legal outcome (i.e., the holding) logically follows from the legal rule (major premise) and a statement of the relevant facts (minor premise). Realists believe that formalism understates judicial lawmaking abilities insofar as it represents legal outcomes as *entailed* syllogistically by applicable rules and facts. For if legal outcomes are logically implied by propositions that bind judges, it follows that judges lack legal authority to reach conflicting outcomes.

Legal realism can roughly be characterized by the following claims: (1) the class of available legal materials is insufficient to logically entail a unique legal outcome in most cases worth litigating at the appellate level (the Local Indeterminacy Thesis); (2) in such cases, judges make new law in deciding legal disputes through the exercise of a lawmaking discretion (the Discretion Thesis); and (3) judicial decisions in indeterminate cases are influenced by the judge's political and moral convictions-and not by legal considerations. Though (3) is logically independent of (1) and (2), (1) seems to imply (2): insofar as judges decide legally indeterminate cases, they must be creating new law.

It is worth noting the relations between legal realism, formalism, and positivism. While formalism is often thought to be entailed by positivism, it turns out that legal realism is not only consistent with positivism, but also presupposes the truth of all three of positivism's core theses. Indeed, the realist acknowledges that law is essentially the product of official activity, but believes that judicial lawmaking occurs more frequently than is commonly assumed. But the idea that law is essentially the product of official activity presupposes the truth of positivism's Conventionality, Social Fact, and Separability Theses. Though the preoccupations of the realists were empirical (i.e., attempting to identify the psychological and sociological factors influencing judicial decision-making), their implicit conceptual commitments were decidedly positivistic in flavor.

III.2 **Critical Legal Studies**

The critical legal studies (CLS) movement attempts to expand the radical aspects of legal realism into a Marxist critique of mainstream liberal jurisprudence. CLS theorists believe the realists understate the extent of indeterminacy; whereas the realists believe that indeterminacy is local in the sense that it is confined to a certain class of cases, CLS theorists argue that law is radically (or globally) indeterminate in the sense that the class of available legal materials rarely, if ever, logically/causally entails a unique outcome.

CLS theorists emphasize the role of ideology in shaping the content of the law. On this view, the content of the law in liberal democracies necessarily reflects "ideological struggles among social factions in which competing conceptions of justice, goodness, and social and political life get compromised, truncated, vitiated, and adjusted" (Altman 1986, p. 221). The inevitable outcome of such struggles, on this view, is a profound inconsistency permeating the deepest layers of the law. It is this pervasive inconsistency that gives rise to radical indeterminacy in the law. For insofar as the law is inconsistent, a judge can justify any of a number of conflicting outcomes.

At the heart of the CLS critique of liberal jurisprudence is the idea that radical indeterminacy is inconsistent with liberal conceptions of legitimacy. According to these traditional liberal conceptions, the province of judges is to interpret, and not make, the law. For, on this view, democratic ideals imply that lawmaking must be left to legislators who, unlike appointed judges, are accountable to the electorate. But if law is radically indeterminate, then judges nearly always decide cases by making new law, which is inconsistent with liberal conceptions of the legitimate sources of lawmaking authority.

III.3. **Law and Economics**

The law and economics movement argues for the value of economic analysis in the law both as a

description about how courts and legislators do behave and as a prescription for how such officials should behave. The legal economists, led by Richard Posner, argue that the content of many areas of the common law can be explained in terms of its tendency to maximize preferences:

> [M]any areas of law, especially the great common law fields of property, torts, crimes, and contracts, bear the stamp of economic reasoning. It is not a refutation that few judicial opinions contain explicit references to economic concepts. Often the true grounds of decision are concealed rather than illuminated by the characteristic rhetoric of judicial opinions. Indeed, legal education consists primarily of learning to dig beneath the rhetorical surface to find those grounds, many of which may turn out to have an economic character (Posner 1992, p. 23).

Posner subscribes to the so-called efficiency theory of the common law, according to which "the common law is best (not perfectly) explained as a system for maximizing the wealth of society" (Posner 1992, p. 23).

More influential than Posner's descriptive claims is his normative view that law should strive to maximize wealth. According to Posner, the proper goal of the statutory and common law is to promote wealth maximization, which can best be done by facilitating the mechanisms of the free market. Posner's normative view combines elements of utilitarian analysis with a Kantian respect for autonomy. On the utilitarian side, markets tend to maximize wealth and the satisfaction of preferences. In a market transaction with no third-party effects, wealth is increased because all parties are made better off by the transaction-otherwise there would be no incentive to consummate the transaction-and no one is made worse off.

On the Kantian side, the law should facilitate market transactions because market transactions best reflect autonomous judgments about the value of individual preferences. At least ideally, individuals express and realize their preferences through mutually consensual market transactions consummated from positions of equal bargaining power. Thus, market transactions tend, ideally, to be both efficient (because they tend to maximize wealth without harmful third-party effects) and just (because all parties are consenting).

III.4 **Outsider Jurisprudence**

So-called outsider jurisprudence is concerned with providing an analysis of the ways in which law is structured to promote the interests of white males and to exclude females and persons of color. For example, one principal objective of feminist jurisprudence is to show how patriarchal assumptions have shaped the content of laws in a wide variety of areas: property, contract, criminal law, constitutional law, and the law of civil rights. Additionally, feminist scholars challenge traditional ideals of judicial decision-making according to which judges decide legal disputes by applying neutral rules in an impartial and objective fashion. Feminists have, of course, always questioned whether it is possible for judges to achieve an objective and impartial perspective, but now question whether the traditional model is even desirable.

Critical race theory is likewise concerned to point up the way in which assumptions of white supremacy have shaped the content of the law at the expense of persons of color. Additionally, critical race theorists show how the experience, concerns, values, and perspectives of persons of color are systematically excluded from mainstream discourse among practicing lawyers, judges, and legislators. Finally, such theorists attempt to show how assumptions about race are built into most liberal theories of law.

Laws of Nature

Laws of Nature are to be distinguished both from Scientific Laws and from Natural Laws (as invoked in legal or ethical theories [see Natural Laws]). Neither Scientific Laws nor Natural Laws will be discussed in this article. This article explores issues in contemporary metaphysics -- not in ethical theory, not in legal theory, and not in the philosophy of science. Within metaphysics, there are two competing theories of Laws of Nature. On one account - the Regularity Theory - Laws of Nature are statements of the uniformities (regularities) in the world, i.e. are mere descriptions of the way the world is. On the other account - the Necessitarian Theory - Laws of Nature are the 'principles' which govern the natural phenomena of the world, i.e. the natural world 'obeys' the Laws of Nature. This seemingly innocuous difference marks one of the most profound gulfs within contemporary philosophy, and has quite unexpected, and wide-ranging, implications. Below is an outline of the topics discussed in the article:

Laws of Nature vs. Laws of Science

In 1959, at the annual meeting of the American Association for the Advancement of Sciences, Michael Scriven read a paper that implicitly distinguished between Laws of Nature and Laws of Science. Laws of Science (what he at that time called "physical laws") – with few exceptions – are inaccurate, are at best approximations of the truth, and are of limited range of application. The theme has since been picked up and advanced by Nancy Cartwright.

If *scientific* laws are inaccurate, then – presumably – there must be some *other* laws (statements, propositions, principles), doubtless more complex, which *are* accurate, which are not approximation to the truth but are literally true.

When, for example, generations of philosophers have agonized over whether physical determinism precludes the existence of free will (e.g. Honderich), they have been concerned with these latter laws, the laws of nature itself.

It is the explication of these latter laws, the Laws of Nature, that is the topic of this article. We will not here be examining the 'approximate truths' of science. Thus, to cite just one example, the controversy over whether scientific laws are (merely) *instruments* lies outside the topic of this article.

The Two Principal Views

Theories as to the features of Laws of Nature fall into two, quite distinct, schools: the Humeans (or Neo-Humeans) on the one side, the Necessitarians on the other.

Regularity

Recent scholarship (e.g. that of J. Wright and of Beauchamp and Rosenberg) makes a convincing case that the received view as to what David Hume offered as an explication of the concept of *law of nature* was quite mistaken, indeed the very opposite of what Hume was arguing. What, historically, until late in the Twentieth Century, was called the "Humean" account of Laws of Nature was a misnomer. Hume himself was no 'Humean' as regards laws of nature. Hume, it turns out, was a Necessitarian – i.e. believed that laws of nature are in some sense 'necessary' (although of course not *logically* necessary). His

legendary skepticism was *epistemological*. He was concerned, indeed even baffled, how our knowledge of physical necessity could arise. What, in experience, accounted for the origin of the idea? What, in experience, provided evidence of the existence of the property? He could find nothing that played such a role.

Yet, in spite of his epistemological skepticism, he persisted in his belief that laws of nature *are* (physical) necessities. So as not to perpetuate the historical error as to what "Humean" properly connotes, I will abandon that term altogether and will adopt the relatively unproblematical term "Regularity" in its stead. At the very least, the **Regularists'** Theory of Laws of Nature denies that Laws of Nature are 'physically necessary'. There is no physical necessity, either in laws or in nature itself. There is no intermediate state between logical necessity on the one hand and sheer contingency on the other.

Necessitarianism

Necessitarians, in contrast, argue that there *is* physical (or as they sometimes call it "nomic" or "nomological") necessity. They offer two different accounts. According to some Necessitarians, physical necessity is a property of the Laws of Nature (along with truth, universality, etc.); according to other Necessitarians, physical necessity inheres in the very woof and warp (the stuff and structure) of the universe.

Thus, for example, on the first of these two Necessitarian theories, electrons will bear the electrical charge -1.6×10^{-19} Coulombs because there is a Law of Nature to that effect, and the universe conforms to, or is 'governed' by, this physically necessary (i.e. nomological) principle (along with a number of others, of course).

On the second of the two Necessitarian theories, the 'necessity' of an electron's bearing this particular electrical charge 'resides' in the electron itself. It is of the very 'nature' of an electron, by necessity, to have this particular electrical charge. On this latter account, the statement "All electrons bear a charge of -1.6×10^{-19} Coulombs" is a Law of Nature because it correctly (veridically) describes a physical necessity in the world.[1]

Shared Elements in the Competing Theories

Regularists and Necessitarians agree as to five conditions necessary for a statement's being a Law of Nature.

Laws of Nature

1.	are factual truths, not logical ones;	"The boiling point of sulfur is 444.6° Celsius" expresses a factual truth. "Every number has a double" expresses a logical truth.
2.	are true for every time and every place in the universe;	There are no laws of nature that hold just for the planet earth (or the Andromeda Galaxy, for that matter), nor are there any that hold just for the Eighteenth Century or just for the Mesozoic Era.
3.	contain no proper names;	Laws of nature may contain general concepts, such as "mass", "color", "aptitude", "capital", "diabetes", "return on investments", etc.; but may not contain such terms as "the Fraser River", "the planet Earth", "$59.22", "June 18, 1935", "IBM", etc.
4.	are universal or statistical claims; and	"(All pure) copper conducts electricity" expresses a law of nature. But "Stars exist" (although true) does not express a law of nature: it is neither a universal nor a statistical claim.
5.	are conditional claims, not categorical ones.	Categorical claims which are equivalent to conditional claims (e.g. "There are no perpetual motion machines of the first kind" which is equivalent to "If anything is a perpetual motion machine then it is not of the first kind") are candidates for lawfulness.[2] Categorical claims (e.g., again, "There are stars") which are not equivalent to conditionals are not candidates for lawfulness. Note: Laws of physics which are expressed mathematically are taken to be elliptical for conditional truths. For example, the law "$m_v = m_o/(1 - v^2/c^2)^{½}$ " is to be read as equivalent to "for any massy object, if its velocity is v, then its mass [m_v] is equal to its rest mass [m_o] divided by ..."

Are these five conditions *jointly sufficient* for a proposition's being a Law of Nature? Regularists say "yes"; Necessitarians, "no".

The Case for Necessitarianism

Necessitarians lay claim to a number of examples which, they say, can be explicated only by positing a sixth necessary condition for laws of nature, viz. by positing natural (physical /nomic /nomological) necessity.

Accidental Truths vs. Laws of Nature

Moas (a large flightless bird that lived in New Zealand) have been extinct for more than a century. We can assume (this example is Popper's [*The Logic of Scientific Discovery*, Appendix *x]) that some one of them (we needn't know which one) was the oldest Moa ever to have lived. Suppose it died at the age of *n* years. Thus the statement "No moa lives beyond the age of *n* years" is **true** (where "lives" is being used as a tenseless verb). Moreover this statement satisfies all the other necessary conditions specified above.

But, Necessitarians will argue, the statement "No moa lives beyond the age of *n* years" is not a law of nature. It is counterintuitive to believe that such a statement could be on the same (metaphysical) footing as "No perpetual motion machine of the first kind exists", or, citing another example, "No object having mass is accelerated beyond the speed of light". The latter statements are bona fide laws of nature; the former a mere 'accidental' truth. The difference lies in the (alleged) fact that the latter two cases (about perpetual motion machines and about massy objects) are physically necessary truths; the former (about moas) is a mere accidental truth. To use Popper's terminology, genuine laws of nature "forbid" certain things to happen; accidental truths do not. Suppose the oldest moa – we'll call him Ludwig – died, of an intestinal infection, at the age of (let's say) 12 years. (I haven't any idea what the average life span of moas was. It's irrelevant for our purposes.) Now suppose that Ludwig had a younger brother, Johann, hatched from the same clutch of eggs, one hour later than Ludwig himself. Poor Johann – he was shot by a hunter 10 minutes before Ludwig died of his illness. But, surely, had Johann not been shot, he would have lived to a greater age than Ludwig. Unlike his (very slightly) older brother, Johann was in perfect health. Johann was well on his way to surviving Ludwig; it's just that a hunter dispatched him prematurely. His death was a misfortune; it was not mandated by a law of nature.

False Existentials

False existential statements of the sort "Some silver burns at -22° Celsius" and "There is a river of cola" are logically equivalent to statements satisfying all of the five necessary conditions specified above. If those conditions were to constitute a set of *sufficient* conditions for a statement's being a law of nature, then the statement "No river is constituted of cola" would be a law of nature.[3]

The oddity goes even more deeply. Given that what it is to be physically impossible is to be logically inconsistent with a law of nature, then every false existential statement of the sort "Some S is P" or "There is an S that is a P" would turn out to be, not just false, but physically impossible.

But surely the statement "There is a river of cola", although false, is *not* physically impossible. There *could* be such a river. It would merely require a colossal accident (such as befell Boston in 1912 when a huge vat of molasses ruptured), or the foolish waste of a great deal of money.

If "there is a river of cola" is not to be regarded as physically impossible, then some one or more further conditions must be added to the set of necessary conditions for lawfulness. Physical necessity would seem to be that needed further condition.

Doom vs. Failure

Suppose (1) that Earth is the only planet in the universe to have supported intelligent life; and (2) that all life on Earth perished in 1900 when the earth was struck by a meteor 10,000 km in diameter. Clearly, under those conditions, the Wright Brothers would never have flown their plane at Kitty Hawk. Even though tinkerers and engineers had been trying for centuries to build a heavier-than-air motorized flying machine, everyone had failed to produce one. But their failure was *merely* failure; these projects were not doomed. Yet, if the universe had had the slightly different history just described, the statement "there is a heavier-than-air motorized flying machine" would turn out to be physically impossible; hence the project was *doomed*. But, Necessitarians will argue, not all projects that fail are doomed. Some are doomed, e.g. any attempt to accelerate a massy object beyond the speed of light, or, e.g. to build a perpetual motion machine of the first kind. Again, just as in the case of accidental truths and lawful truths, we do not want to collapse the distinction between doom and failure. Some projects are *doomed*; others are *mere failures*. The distinction warrants being preserved, and that requires positing physical necessity (and – what is the other side of the same coin – physical impossibility).

The Case for Regularity

With the dawning of the modern, scientific, age came the growing realization of an extensive sublime order in nature. To be sure, humankind has always known that there is *some* order in the natural world – e.g. the tides rise and fall, the moon has four phases, virgins have no children, water slakes thirst, and persons grow older, not younger. But until the rise of modern science, no one suspected the sweep of this order. The worldview of the West has changed radically since the Renaissance. From a world which seemed mostly chaotic, there emerged an unsuspected underlying *order*, an order revealed by physics, chemistry, biology, economics, sociology, psychology, neuroscience, geology, evolutionary theory, pharmacology, epidemiology, etc.

And so, alongside the older metaphysical question, "Why is there anything, rather than nothing?", there arises the newer question, "Why is the world orderly, rather than chaotic?" How can one explain the existence of this pervasive order? What accounts for it?

Naturalizing Philosophy

Even as recently as the Eighteenth Century, we find philosophers (e.g. Montesquieu) explicitly attributing the order in nature to the hand of God, more specifically to His having imposed physical laws on nature in much the same way as He imposed moral laws on human beings. There was one essential difference, however. Human beings – it was alleged – are 'free' to break (act contrary to) God's moral laws; but neither human beings nor the other parts of creation are free to break God's physical laws.

In the Twentieth Century virtually all scientists and philosophers have abandoned theistic elements in their accounts of the Laws of Nature. But to a very great extent – so say the Regularists – the Necessitarians have merely replaced God with Physical Necessity. The Necessitarians' nontheistic view of Laws of Nature surreptitiously preserves the older prescriptivist view of Laws of Nature, viz. as *dictates* or *edicts* to the natural universe, edicts which – unlike moral laws or legislated ones – no one, and no thing, has the ability to violate.

Regularists reject this view of the world. Regularists eschew a view of Laws of Nature which would make of them inviolable edicts imposed on the universe. Such a view, Regularists claim, is simply a holdover from a theistic view. It is time, they insist, to adopt a thoroughly naturalistic philosophy of science, one which is not only purged of the hand of God, but is also purged of its unempirical latter-day surrogate, viz. nomological necessity. The difference is, perhaps, highlighted most strongly in Necessitarians saying that the Laws of Nature *govern* the world; while Regularists insist that Laws of Nature do no more or less than correctly *describe* the world.

Revisiting Physical Impossibility

Doubtless the strongest objection Necessitarians level against Regularists is that the latter's theory obliterates the distinction between laws of nature (e.g. "No massy object is accelerated beyond the speed of light") and accidental generalizations (e.g. "No Moa lives more than *n* years"). Thus, on the Regularists' account, there is a virtually limitless number of Laws of Nature. (Necessitarians, in contrast, typically operate with a view that there are only a very small number, a mere handful, of Laws of Nature, that these are the 'most fundamental' laws of physics, and that all other natural laws are *logical* consequences of [i.e. 'reducible to'] these basic laws. I will not further pursue the issue of reductivism in this article.)

What is allegedly wrong with there being no distinction between accidental generalizations and 'genuine' Laws of Nature? Just this (say the Necessitarians): if there is a virtually limitless number of Laws of Nature, then (as we have seen above) every false existential statement turns out to be *physically impossible* and (again) the distinction between (mere) failure and doom is obliterated.

How can Regularists reply to this seemingly devastating attack, issuing as it does from deeply entrenched philosophical intuitions?

Regularists will defend their theory against this particular objection by arguing that the expression "physically impossible" has different *meanings* in the two theories: there is a common, or shared, meaning of this expression in both theories, but there is an additional feature in the Necessitarians'

account that is wholly absent in the Regularists'.

The common (i.e. shared) meaning in "physically impossible" is "inconsistent with a Law of Nature". That is, anything that is inconsistent with a Law of Nature is "physically impossible". (On a prescriptivist account of Laws of Nature, one would say Laws of Nature "rule out" certain events and states-of-affairs.)

On both accounts – Necessitarianism and Regularity – what is physically impossible never, ever, occurs – not in the past, not at present, not in the future, not here, and not anywhere else.

But on the Necessitarians' account, there is something *more* to a physically impossible event's nonoccurrence and something more to a physically impossible state-of-affair's nonexistence. What is physically impossible is not merely nonoccurrent or nonexistent. These events and states-of-affairs simply *could not* occur or exist. There is, then, in the Necessitarians' account, a ***modal*** element that is entirely lacking in the Regularists' theory. When Necessitarians say of a claim – e.g. that someone has built a perpetual motion machine of the first kind – that it is physically impossible, they intend to be understood as claiming that not only is the situation described timelessly and universally false, it is so *because* it is *nomically* impossible.

In contrast, when Regularists say that some situation is physically impossible – e.g. that there is a river of cola – they are claiming no more and no less than that there is no such river, past, present, future, here, or elsewhere. There is no *nomic* dimension to their claim. They are not making the modal claim that there *could not be* such a river; they are making simply the *factual* (nonmodal) claim that there timelessly *is no* such river. (Further reading: 'The' Modal Fallacy.)

According to Regularists, the concept of *physical impossibility* is nothing but a special case of the concept of timeless falsity. It is only when one imports from other theories (Necessitarianism, Prescriptivism, etc.) a different, modal, meaning of the expression, that paradox seems to ensue. Understand the ambiguity of the expression, and especially its nonmodal character in the Regularity theory, and the objection that the Necessitarians level is seen to miss its mark.

(There is an allied residual problem with the foundations of Necessitarianism. Some recent authors [e.g. Armstrong and Carroll] have written books attempting to explicate the concept of nomicity. But they confess to being unable to explicate the concept, and they ultimately resort to treating it as an *unanalyzable* base on which to erect a theory of physical lawfulness.)

Regularity and Explanation

Another philosophical intuition that has prompted the belief in Necessitarianism has been the belief that to explain why one event occurred rather than another, one must argue that the occurring event 'had to happen' given the laws of nature and antecedent conditions. In a nutshell, the belief is that laws of nature can be used to *explain* the occurrence of events, accidental generalizations – 'mere truths devoid of nomic force' – can not be so utilized.

The heyday of the dispute over this issue was the 1940s and 50s. It sputtered out, in more or less an

intellectual standoff, by the late 60s. Again, philosophical intuitions and differences run very deep. Regularists will argue that we can explain events very well indeed, thank you, in terms of vaguely circumscribed generalities; we do not usually invoke true generalities, let alone true generalities that are assumed to be nomically necessary. In short, we can, and indeed **do** several times each day, explain events without supposing that the principles we cite are in any sense *necessary*. Regularists will point to the fact that human beings had, for thousands of years, been successfully explaining some events in their environment (e.g. that the casting cracked because it had been cooled down too quickly) without even having the *concept* of nomicity, much less being able to cite any nomologically necessary universal generalizations.

Necessitarianism, on this view, then, is seen to dovetail with a certain – highly controversial – view of the nature of explanation itself, viz. that one can explain the occurrence of an event only when one is in a position to cite a generalization which is nomologically necessary. Few philosophers are now prepared to persist with this view of explanation, but many still retain the belief that there are such things as nomologically necessary truths. Regularists regard this belief as superfluous.

Problems with Necessitarianism I – Its Inverting the Truth-making Relation

Religious skeptics – had they lived in a society where they might have escaped torture for asking the question – might have wondered why (/how) the world molds itself to God's will. God, on the Prescriptivist view of Laws of Nature, commanded the world to be certain ways, e.g. it was God's will (a law of nature that He laid down) that all electrons should have a charge of -1.6×10^{-19} Coulombs. But how is all of this supposed to play out? How, exactly, is it that electrons *do* have this particular charge? It is a mighty strange, and unempirical, science that ultimately rests on an unintelligible power of a/the deity.

Twentieth-century Necessitarianism has dropped God from its picture of the world. Physical necessity has assumed God's role: the universe conforms to (the dictates of? / the secret, hidden, force of? / the inexplicable mystical power of?) physical laws. God does not 'drive' the universe; physical laws do.

But **how**? How could such a thing be possible? The very posit lies beyond (far beyond) the ability of science to uncover. It is the transmuted remnant of a supernatural theory, one which science, emphatically, does not need.

There is another, less polemical, way of making the same point.

Although there are problems aplenty in Tarski's theory of truth (i.e. the semantic theory of truth, also called the "correspondence theory of truth"), it is the best theory we have. Its core concept is that statements (or propositions) are true if they describe the world the way it is, and they are false otherwise. Put metaphorically, we can say that truth flows to propositions from the way the world is. Propositions 'take their truth' from the world; they do not impose their truth on the world. If two days before an election, Tom says "Sylvia will win", and two days after the election, Marcus says, "Sylvia won", then whether these statements are true or false depends on whether or not Sylvia is elected. If she is, both

statements are true; if she is not, then both statements are false. But the truth or falsity of those statements does not bring about her winning (or losing), or cause her to win (or lose), the election. Whether she wins or loses is up to the voters, not to certain statements.

Necessitarians – unwittingly perhaps – turn the semantic theory of truth on its head. Instead of having propositions taking their truth from the way the world is, they argue that certain propositions – namely the laws of nature – impose truth on the world.

The Tarskian truth-making relation is between events or state-of-affairs on the one hand and properties of abstract entities (propositions) on the other. As difficult as it may be to absorb such a concept, it is far more difficult to view a truth-making relationship the 'other way round'. Necessitarianism requires that one imagine that a certain privileged class of propositions impose their truth on events and states of affairs. Not only is this monumental oddity of Necessitarianism hardly ever noticed, no one – so far as I know – has ever tried to offer a theory as to its nature.

Problems with Necessitarianism II – Its Unempiricalness

Eighteenth-century empiricists (Hume most especially) wondered where, in experience, there was anything that prompted the concept of physical necessity. Experience, it would seem, provides at best only data about how the world *is*, not how it *must be*, i.e. experience provides data concerning regularity, not (physical) necessity. Hume's best answer, and it is clearly inadequate, lay in a habit of mind.

Twentieth-century empiricists are far more concerned with the justification of our concepts than with their origins. So the question has now evolved to "what evidence exists that warrants a belief in a physical necessity beyond the observed and posited regularities in nature?"

A number of Necessitarians (see, for example, von Wright) have tried to describe experiments whose outcomes would justify a belief in physical necessity. But these thought-experiments are impotent. At best – as Hume clearly had seen – any such experiment could show no more than a pervasive regularity in nature; none could demonstrate that such a regularity flowed from an underlying necessity.

The Regularists' Trump Card – The Dissolution of the Problem of Free Will and Determinism

In the Regularity theory, the knotted problem of free will vs. determinism is solved (or better, 'dissolved') so thoroughly that it cannot coherently even be posed.

On the Regularists' view, there simply is no problem of free will. We make choices – some trivial, such as to buy a newspaper; others, rather more consequential, such as to buy a home, or to get married, or to go to university, etc. – but these choices are not forced upon us by the laws of nature. Indeed, it is the other way round. Laws of nature are (a subclass of the) true descriptions of the world. Whatever happens in the world, there are true descriptions of those events. It's true that you cannot 'violate' a law of nature, but that's not because the laws of nature 'force' you to behave in some certain way. It is rather that

whatever you do, there is a true description of what you have done. You certainly don't get to choose the laws that describe the charge on an electron or the properties of hydrogen and oxygen that explain their combining to form water. But you do get to choose a great many other laws. How do you do that? Simply by doing whatever you do in fact do.

For example, if you were to choose(!) to raise your arm, then there would be a timelessly true universal description (let's call it "D_{4729}") of what you have done. If, however, you were to choose not to raise your arm, then there would be a (different) timelessly true universal description (we can call it "D_{5322}") of what you did (and D_{4729} would be timelessly false).

Contrary to the Necessitarians' claim – that the laws of nature are not of our choosing – Regularists argue that a very great many laws of nature **are** of our choosing. But it's not that you reflect on choosing the laws. You don't wake up in the morning and ask yourself "Which laws of nature will I create today?" No, it's rather that you ask yourself, "What will I do today?", and in choosing to do some things rather than others, your actions – i.e. your choices – make certain propositions (including some universal statements containing no proper names) true and other propositions false.

A good example embodying the Regularists' view can be found in the proposition, attributed to Sir Thomas Gresham (1519?-1579) but already known earlier, called – not surprisingly – "Gresham's Law":

> [Gresham's Law is] the theory holding that if two kinds of money in circulation have the same denominational value but different intrinsic values, the money with higher intrinsic value will be hoarded and eventually driven out of circulation by the money with lesser intrinsic value.

In effect what this 'law' states is that 'bad money drives out good'. For example, in countries where the governments begin issuing vast amounts of paper money, that money becomes next-to-worthless and people hoard 'good' money, e.g. gold and silver coins, that is, 'good' money ceases to circulate.

Why, when paper money becomes virtually worthless, do people hoard gold? Because gold retains its economic value – it can be used in emergencies to purchase food, clothing, flight (if need be), medicine, etc., even when 'bad' paper money will likely not be able to be so used. People do not hoard gold under such circumstances because Gresham's 'Law' forces them to do so. Gresham's 'Law' is purely descriptive (not prescriptive) and illustrates well the point Regularists insist upon: namely, that laws of economics are not causal agents – they do not force the world to be some particular way rather than another. (Notice, too, how this non-nomological 'Law' works perfectly adequately in explaining persons' behavior. Citing regularities can, and does, explain the way the world is. One does not need to posit an underlying, inaccessible, nomicity.)

The manner in which we regard Gresham's 'Law' ought, Regularists suggest, to be the way we regard all laws of nature. The laws of physics and chemistry are no different than the laws of economics. All laws of nature – of physics, of chemistry, of biology, of economics, of psychology, of sociology, etc. – are nothing more, nor anything less, than (a certain subclass of) true propositions.

Persons who believe that there is a problem reconciling the existence of free will and determinism have turned upside down the relationship between laws of nature on the one side and events and states of

affairs on the other. It is not that laws of nature govern the world. We are not 'forced' to choose one action rather than another. It is quite the other way round: we choose, and the laws of nature accommodate themselves to our choice. If I choose to wear a brown shirt, then it is *true* that I do so; and if instead I were to choose to wear a blue shirt, then it would be true that I wear a blue shirt. In neither case would my choosing be 'forced' by the truth of the proposition that describes my action. And the same semantic principle applies even if the proposition truly describing my choice is a universal proposition rather than a singular one.

To make the claim even more pointedly: it is only because Necessitarianism tacitly adopts an anti-semantic theory of truth that the supposed problem of free will vs. determinism even arises. Adopt a thoroughgoing Regularist theory and the problem evaporates.

Statistical Laws

Many, perhaps most, of workaday *scientific laws* (recall the first section above) are statistical generalizations – e.g. the scientific claims (explanatory principles) of psychology, economics, meteorology, ecology, epidemiology, etc.

But can the underlying, the 'real', Laws of Nature itself be statistical?

With occasional reluctance, especially early in the Twentieth Century, physicists came to allow that at least some laws of nature really are statistical, e.g. laws such as "the half-life of radium is 1,600 years" which is a shorthand way of saying "in any sample of radium, 50% of the radium atoms will radioactively decay within a period of 1,600 years".

Regularists take the prospect (indeed the existence) of statistical laws of nature in stride. On the Regularists' account, statistical laws of nature – whether in areas studied by physicists or by economists or by pharmacologists – pose no intellectual or theoretical challenges whatsoever. Just as deterministic (i.e. exceptionless) laws are descriptions of the world, not prescriptions or disguised prescriptions, so too are statistical laws.

Necessitarians, however, frequently have severe problems in accommodating the notion of statistical laws of nature. What sort of metaphysical 'mechanism' could manifest itself in statistical generalities? Could there be such a thing as stochastic nomicity? Popper grappled with this problem and proposed what he came to call "the propensity theory of probability". On his view, each radium atom, for example, would have its 'own'(?) 50% propensity to decay within the next 1,600 years. Popper really did see the problem that statistical laws pose for Necessitarianism, but his solution has won few, if any, other subscribers. To Regularists, such solutions appear as evidence of the unworkability and the dispensability of Necessitarianism. They are the sure sign of a theory that is very much in trouble.

Is the Order in the Universe a Cosmic Coincidence?

An important subtext in the dispute between Necessitarians and Regularists concerns the very concepts we need to 'make sense' of the universe.

For Regularists, the way-the-world-is is the rock bottom of their intellectual reconstruction. They have reconciled themselves to, and embraced, the ultimately inexplicable *contingency* of the universe.

But for Necessitarians, the way-the-world-is cannot be the rock bottom. For after all – they will insist – there has to be some reason, some explanation, why the world is as it is and is not some other way. It can't simply be, for example, that all electrons, the trillions upon trillions of them, just happen to all bear the identical electrical charge as one another – that would be a cosmic coincidence of an unimaginable improbability. No, this is no coincidence. The identity of electrical charge comes about because there is a law of nature to the effect that electrons have this charge. Laws of nature 'drive' the world. The laws of physics which, for example, describe the behavior of diffraction gratings (see Harrison) were true from time immemorial and it is because of those laws that diffraction gratings, when they came to be engineered in modern times, have the peculiar properties they do.

Regularists will retort that the supposed explanatory advantage of Necessitarianism is illusory. Physical necessity – nomicity if you will – is as idle and unempirical a notion as was Locke's posit of a material substratum. Locke's notion fell into deserved disuse simply because it did no useful work in science. It was a superfluous notion. (The case is not unlike modern arguments that minds are convenient fictions, the product of 'folk' psychology.)

At some point explanations must come to an end. Regularists place that stopping point at the way-the-world-is. Necessitarians place it one, inaccessible, step beyond, at the way-the-world-must-be.

The divide between Necessitarians and Regularists remains as deep as any in philosophy. Neither side has conceived a theory which accommodates all our familiar, and deeply rooted, historically-informed beliefs about the nature of the world. To adopt either theory is to give up one or more strong beliefs about the nature of the world. And there simply do not seem to be any other theories in the offing. While these two theories are clearly logical contraries, they are – for the foreseeable future – also exhaustive of the alternatives.

Notes

1. Throughout this article, the term "world" is used to refer to the entire universe, past, present, and future, to whatever is near and whatever is far, and to whatever is known of that universe and what is unknown. The term is never used here to refer to just the planet Earth.

   Clearly, one presupposition of this article is that the world (i.e. the universe) is not much of our

making. Given the sheer size of the universe, our human effect on it is infinitesimal. The world is not mind-constructed. The world is some one particular way, although it remains a struggle to figure out what that way is. [Return]

2. A perpetual motion machine *of the first kind* is a hypothetical machine in which no energy is required for performing work. [Return]

3. *In detail* – The statement "There is a river of cola" is an existential affirmative statement (a classical so-called **I**-proposition). Its contradictory (or better, among its contradictories) is the statement "No river is constituted of cola" (a classical so-called **E**-proposition). Now, given that "There is a river of cola" is, ex hypothesi, timelessly *false*, then the universal negative proposition, "No river is constituted of cola", is timelessly *true*. But since the latter satisfies all five of the necessary conditions specified (above) for being a law of nature, it would turn out to be a law of nature. [Return]

Legal Positivism

Legal positivism is a conceptual theory emphasizing the conventional nature of law. Its foundation consists in the pedigree thesis and separability thesis, which jointly assert that law is manufactured according to certain social conventions. Also associated with positivism is the view, called the discretion thesis, that judges make new law in deciding cases not falling clearly under a legal rule. As an historical matter, positivism arose in opposition to classical natural law theory, according to which there are necessary moral constraints on the content of law. The word 'positivism' was probably first used to draw attention to the idea that law is "positive" or "posited," as opposed to being "natural" in the sense of being derived from natural law or morality.

Contents

The Pedigree Thesis. The pedigree thesis asserts that legal validity is a function of certain social facts. Borrowing heavily from Jeremy Bentham, John Austin argues that the principal distinguishing feature of a legal system is the presence of a sovereign who is habitually obeyed by most people in the society, but not in the habit of obeying any determinate human superior (Austin 1995, p. 166). On Austin's view, a rule R is legally valid (i.e., is a law) in a society S if and only if R is commanded by the sovereign in S and is backed up with the threat of a sanction. The severity of the threatened sanction is irrelevant; any general sovereign imperative supported by a threat of even the smallest harm is a law.

Austin's command theory of law is vulnerable to a number of criticisms. One problem is that there appears to be no identifiable sovereign in democratic societies. In the United States, for example, the ultimate political power seems to belong to the people, who elect lawmakers to represent their interests. Elected lawmakers have the power to coerce behavior but are regarded as servants of the people and not as repositories of sovereign power. The voting population, on the other hand, seems to be the repository of ultimate political authority yet lacks the immediate power to coerce behavior. Thus, in democracies like that of the United States, the ultimate political authority and the power to coerce behavior seem to reside in different entities.

A second problem has to do with Austin's view that the sovereign lawmaking authority is incapable of legal limitation. On Austin's view, a sovereign cannot be legally constrained because no person (or body of persons) can coerce herself (or itself). Since constitutional provisions limit the authority of the legislative body to make laws, Austin is forced to argue that what we refer to as constitutional law is really not law at all; rather, it is principally a matter of "positive morality" (Austin 1977, p. 107).

Austin's view is difficult to reconcile with constitutional law in the United States. Courts regard the procedural and substantive provisions of the constitution as constraints on legal validity. The Supreme Court has held, for example, that "an unconstitutional act is not a law; it confers no rights; it imposes no duties; it is, in legal contemplation, as inoperative as though it had never been passed." (*Norton v. Shelby County*, 118 U.S. 425 (1886)). Moreover, these constraints purport to be legal constraints: the Supremacy Clause of Article VI of the Constitution states that "[t]his Constitution ... shall be the supreme *Law* of the Land; and the Judges in every State shall be bound thereby."

The most influential criticisms of Austin's version of the pedigree thesis, however, owe to H. L. A. Hart's seminal work, *The Concept of Law*. Hart points out that Austin's theory provides, at best, a partial account of legal validity because it focuses on one kind of rule, namely that which requires citizens "to do or abstain from certain actions, whether they wish to or not" (Hart 1994, p. 81). While every legal system must contain so-called primary rules that regulate citizen behavior, Hart believes a system consisting entirely of the kind of liberty restrictions found in the criminal law is, at best, a rudimentary or primitive legal system.

On Hart's view, Austin's emphasis on coercive force leads him to overlook the presence of a second kind of primary rule that confers upon citizens the power to create, modify, and extinguish rights and obligations in other persons. As Hart points out, the rules governing the creation of contracts and wills cannot plausibly be characterized as restrictions on freedom that are backed by the threat of a sanction. These rules empower persons to structure their legal relations within the coercive framework of the law-a feature that Hart correctly regards as one of "law's greatest contributions to social life." The operation of power-conferring primary rules, according to Hart, indicates the presence of a more sophisticated system for regulating behavior.

But what ultimately distinguishes societies with full-blown systems of law from those with only rudimentary or primitive forms of law is that the former have, in addition to first-order primary rules, secondary meta-rules that have as their subject matter the primary rules themselves:

> [Secondary rules] may all be said to be on a different level from the primary rules, for they are all *about* such rules; in the sense that while primary rules are concerned with the actions that individuals must or must not do, these secondary rules are all concerned with the primary rules themselves. They specify the way in which the primary rules may be conclusively ascertained, introduced, eliminated, varied, and the fact of their violation conclusively determined (Hart 1994, p. 92).

Hart distinguishes three types of secondary rules that mark the transition from primitive forms of law to full-blown legal systems: (1) the rule of recognition, which "specif[ies] some feature or features possession of which by a suggested rule is taken as a conclusive affirmative indication that it is a rule of the group to be supported by the social pressure it exerts" (Hart 1994, p. 92); (2) the rule of change, which enables a society to add, remove, and modify valid rules; and (3) the rule of adjudication, which provides a mechanism for determining whether a valid rule has been violated. On Hart's view, then, every society with a full-blown legal system necessarily has a rule of recognition that articulates criteria for legal validity that include provisions for making, changing and adjudicating law. Law is, to use Hart's

famous phrase, "the union of primary and secondary rules" (Hart 1994, p. 107). Austin theory fails, on Hart's view, because it fails to acknowledge the importance of secondary rules in manufacturing legal validity.

Hart also finds fault with Austin's view that legal obligation is essentially coercive. According to Hart, there is no difference between the Austinian sovereign who governs by coercing behavior and the gunman who orders someone to hand over her money. In both cases, the subject can plausibly be characterized as being "obliged" to comply with the commands, but not as being "duty-bound" or "obligated" to do so (Hart 1994, p. 80). On Hart's view, the application of coercive force alone can never give rise to an obligation-legal or otherwise.

Legal rules are obligatory, according to Hart, because people accept them as standards that justify criticism and, in extreme cases, punishment of deviations:

> What is necessary is that there should be a critical reflective attitude to certain patterns of behaviour as a common standard, and that this should display itself in criticism (including self-criticism), demands for conformity, and in acknowledgements that such criticism and demands are justified, all of which find their characteristic expression in the normative terminology of 'ought', 'must', and 'should', and 'right' and 'wrong' (Hart 1994, p. 56).

The subject who reflectively accepts the rule as providing a standard that justifies criticism of deviations is said to take "the internal point of view" towards it.

On Hart's view, it would be too much to require that the bulk of the population accept the rule of recognition as the ultimate criteria for legal validity: "the reality of the situation is that a great proportion of ordinary citizens-perhaps a majority-have no general conception of the legal structure or its criteria of validity" (Hart 1994, p. 111). Instead, Hart argues that what is necessary to the existence of a legal system is that the majority of officials take the internal point of view towards the rule of recognition and its criteria of validity. All that is required of citizens is that they generally obey the primary rules that are legally valid according to the rule of recognition.

Thus, on Hart's view, there are two minimum conditions sufficient and necessary for the existence of a legal system: "On the one hand those rules of behaviour which are valid according to the system's ultimate criteria of validity must be generally obeyed, and, on the other hand, its rules of recognition specifying the criteria of legal validity and its rules of change and adjudication must be effectively accepted as common public standards of official behaviour by its officials" (Hart 1994, p. 113).

Hart's view is vulnerable to the same criticism that he levels against Austin. Hart rejects Austin's view because the institutional application of coercive force can no more give rise to an obligation than can the application of coercive force by a gunman. But the situation is no different if the gunman takes the internal point of view towards his authority to make such a threat. Despite the gunman's belief that he is entitled to make the threat, the victim is obliged, but not obligated, to comply with the gunman's orders. The gunman's behavior is no less coercive because he believes he is entitled to make the threat.

And likewise for a minimal legal system where only the officials of the legal system take the internal point of view towards the rule of recognition that endows them with authority to make, execute, adjudicate, and enforce the rules. The mere presence of a belief in the officials that they are entitled to make law cannot give rise to an obligation in other people to comply with their enactments any more than the presence of a belief on the part of a gunman that he is entitled to issue orders gives rise to an obligation in the victim to comply with those orders. Hart's minimal legal system is no less coercive than Austin's legal system.

The Separability Thesis. The second thesis comprising the foundation of legal positivism is the separability thesis. In its most general form, the separability thesis asserts that law and morality are conceptually distinct. This abstract formulation can be interpreted in a number of ways. For example, Klaus Füßer (1996) interprets it as making a meta-level claim that the definition of law must be entirely free of moral notions. This interpretation implies that any reference to moral considerations in defining the related notions of law, legal validity, and legal system is inconsistent with the separability thesis.

More commonly, the separability thesis is interpreted as making only an object-level claim about the existence conditions for legal validity. As H.L.A. Hart describes it, the separability thesis is no more than the "simple contention that it is in no sense a necessary truth that laws reproduce or satisfy certain demands of morality, though in fact they have often done so" (Hart 1994, pp. 181-82). Insofar as the object-level interpretation of the separability thesis denies it is a necessary truth that there are moral constraints on legal validity, it implies the existence of a possible legal system in which there are no moral constraints on legal validity.

Though all positivists agree there are possible legal systems without moral constraints on legal validity, there are conflicting views on whether there are possible legal systems with such constraints. According to inclusive positivism (also known as incorporationism and soft positivism), it is possible for a society's rule of recognition to incorporate moral constraints on the content of law. Prominent inclusive positivists include Jules Coleman and H.L.A. Hart, who maintains that "the rule of recognition may incorporate as criteria of legal validity conformity with moral principles or substantive values ... such as the Sixteenth or Nineteenth Amendments to the United States Constitution respecting the establishment of religion or abridgements of the right to vote" (Hart 1994, p. 250).

In contrast, exclusive positivism (also called hard positivism) denies that a legal system can incorporate moral constraints on legal validity. Exclusive positivists like Joseph Raz (1979, p. 47) subscribe to the source thesis, according to which the existence and content of law can always be determined by reference to its sources without recourse to moral argument. On this view, the sources of law include both the circumstances of its promulgation and relevant interpretative materials, such as court cases involving its application.

At first glance, exclusive positivism may seem difficult to reconcile with what appear to be moral criteria of legal validity in legal systems like that of the United States. For example, the Fourth Amendment provides that "[t]he right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures, shall not be violated." Likewise, the First Amendment prohibits laws abridging the right of free speech. Taken at face value, these amendments seem to make moral standards part of the conditions for legal validity.

Exclusive positivists argue that such amendments can require judges to consider moral standards in certain circumstances, but cannot incorporate those standards into the law. When a judge makes reference to moral considerations in deciding a case, she necessarily creates new law on an issue-and this is so even when the law directs her to consider moral considerations, as the Bill of Rights does in certain circumstances. On this view, all law is settled law and questions of settled law can be resolved without recourse to moral arguments:

> The law on a question is settled when legally binding sources provide its solution. In such cases judges are typically said to apply the law, and since it is source-based, its application involves technical, legal skills in reasoning from those sources and does not call for moral acumen. If a legal question is not answered by standards deriving from legal sources then it lacks a legal answer-the law on such questions is unsettled. In deciding such cases courts

> inevitably break new (legal) ground and their decision develops the law.... Naturally, their decisions in such cases rely at least partly on moral and other extra-legal considerations (Raz 1979, pp. 49-50).

If the judge can resolve an issue involving the First Amendment merely by applying past court decisions, then the issue is settled by the law; if not, then the issue is unsettled. Insofar as the judge looks to controversial moral standards to resolve the issue, she is going beyond the law because the mere presence of controversy about the law implies that it is indeterminate. Thus, on Raz's view, references to moral language in the law, at most, direct judges to consider moral requirements in resolving certain unsettled questions of law. They cannot incorporate moral requirements into the law.

The Discretion Thesis. A third thesis commonly associated with positivism is the discretion thesis, according to which judges decide difficult cases by making new law in the exercise of discretion. Ronald Dworkin describes this thesis as follows:

> The set of these valid legal rules is exhaustive of 'the law', so that if someone's case is not clearly covered by such a rule . . . then that case cannot be decided by 'applying the law.' It must be decided by some official, like a judge, 'exercising his discretion,' which means reaching beyond the law for some other sort of standard to guide him in manufacturing a fresh legal rule or supplementing an old one (Dworkin 1977, p. 17).

On this view, a judge cannot decide a case that does not fall clearly under a valid rule by interpreting or applying the law; she must decide the case by creating or promulgating a law that did not exist prior to the adjudication. Thus, the discretion thesis implies that judges are empowered with a quasi-legislative lawmaking authority in cases that cannot be decided merely by applying law.

Though often associated with positivism, the discretion thesis does not belong to positivism's theoretical core. The pedigree and separability theses purport to be conceptual claims that are true of every possible legal system. These two claims jointly assert that, in every possible legal system, propositions of law are valid in virtue of having been manufactured according to some set of social conventions. On this view, there are no moral constraints on the content of law that hold in every possible legal system.

But many positivists regard the discretion thesis as a contingent claim that is true of some, but not all, possible legal systems. Hart, for example, believes there will inevitably arise cases that do not fall clearly under a rule, but concedes a rule of recognition could deny judges discretion to make law in such cases by requiring judges "to disclaim jurisdiction or to refer the points not regulated by the existing law to the legislature to decide" (Hart 1994, p. 272). Indeed, Hart's inclusive positivism allows him to hold that a rule of recognition could require judges to decide cases in precisely the manner that Dworkin advocates (Hart 1994, p. 263; and see Section IV-2, *infra*). Thus, at least for inclusive positivists like Hart, the discretion thesis makes a different kind of claim than the conceptual claims that form positivism's theoretical core (Himma 1999).

Moreover, the discretion thesis is consistent with some forms of natural law theory. According to Blackstone's classical naturalism, conformity with the natural law is a necessary condition for legal validity in every possible legal system. But insofar as the natural law is incomplete, there will inevitably arise issues that have multiple outcomes consistent with the natural law. Since none of the relevant outcomes in such cases offend the natural law, there is nothing in the assumption of necessary moral constraints on the content of law, in and of itself, that precludes Blackstone from endorsing the discretion thesis in such cases. Of course, if Blackstone believes the natural law contains a principle denying discretion to judges, then *that* commitment is inconsistent with the discretion thesis. But the assertion

there are necessary constraints on the content of law, in and of itself, is consistent with the discretion thesis, even construed as a conceptual claim, as long as there are cases to which the natural law is indifferent.

In any event, Dworkin distinguishes three different senses in which a judge might be said to have discretion: (1) a judge has discretion when she exercises judgment in applying a legal standard to a particular case; (2) a judge has discretion when her decision is not subject to reversal by any other authority; and (3) a judge has discretion when her decision is not bound by any legal standards.

According to Dworkin, positivism's discretion thesis is committed to the third sense of discretion, which he refers to as strong discretion. On Dworkin's view, the thesis that judges have discretion only in the sense that they exercise judgment is trivially true, while the thesis that judges have discretion in the sense that their decisions are not subject to being reversed by a higher authority is false. Even the Supreme Court can be reversed by Congress or by constitutional amendment. Thus, on Dworkin's view, the discretion thesis implies that judges have discretion to decide hard cases by what amounts to an act of legislation because the judge is not bound by any legal standards.

Thus construed, the discretion thesis is inconsistent with ordinary legal practice. Even in the most difficult of cases where there is no clearly applicable law, lawyers do not ask that the judge decide the relevant issue by making new law. Each lawyer cites cases favorable to her client's position and argues that the judge is bound by those cases to decide in her client's favor. As a practical matter, lawyers rarely, if ever, concede there are no legal standards governing a case and ask the judge to legislate in the exercise of discretion.

Nevertheless, the problem with Dworkin's analysis is that it falsely presupposes an official cannot make new law unless there are no legal standards constraining the official's decision. Indeed, lawmaking authorities in legal systems like the U.S. never have what Dworkin describes as strong discretion. Even the legislative decisions of Congress, the highest legislative authority in the nation, are always constrained by constitutional standards. For example, under the Fourteenth Amendment, Congress cannot enact a law that sets one speed limit for male drivers on interstate highways and another for female drivers.

For his part, Hart concedes that judicial lawmaking authority is limited in two respects: "not only are the judge's powers subject to many constraints *narrowing his choice* from which a legislature may be quite free, but since the judge's powers are exercised only to dispose of particular instant cases he cannot use these to introduce large-scale reforms or new codes" (Hart 1994, p. 273). What explains the judge's discretion to make new law in a given case, on Hart's view, is not the absence of legal standards constraining her decision; rather it is the absence of legal standards that dictate a uniquely correct answer to the case. The judge cannot decide such a case merely by applying existing law because there is more than one available outcome that coheres with existing law. In such instances, it is impossible to render a substantive decision (as opposed to simply referring the matter back to the legislature) without creating new law.

The discretion thesis is vulnerable to one powerful objection. Insofar as a judge decides a difficult case by making new law in the exercise of discretion, the case is being decided on the basis of a law that did not exist at the time the dispute arose. If, for example, a judge awards damages to a plaintiff by making new law in the exercise of discretion, it follows that she has held the defendant liable under a law that did not exist at the time the dispute arose. And, as Dworkin points out, it seems patently unfair to deprive a defendant of property for behavior that did not give rise to liability at the time the behavior occurred.

Nevertheless, Dworkin's view fares no better on this count. While Dworkin acknowledges the existence

of difficult cases that do not fall clearly under a rule, he believes they are not resolved by an exercise of judicial discretion. On Dworkin's view, there is always a right answer to such cases implicit in the pre-existing law. Of course, it sometimes takes a judge of Herculean intellectual ability to discern what the right answer is, but it is always there to be found in pre-existing law. Since the right answer to even hard legal disputes is always part of pre-existing law, Dworkin believes that a judge can take property from a defendant in a hard case without unfairness (Dworkin 1977, pp. 87-130).

But if fairness precludes taking property from a defendant under a law that did not exist at the time of the relevant behavior, it also precludes taking property from a defendant under a law that did not give reasonable notice that the relevant behavior gives rise to liability. Due process and fundamental fairness require reasonable notice of which behaviors give rise to liability. As long as Dworkin acknowledges the existence of cases so difficult that only the best of judges can solve them, his theory is vulnerable to the same charge of unfairness that he levels at t he discretion thesis.

Classic Criticisms of Positivism

Fuller's Internal Morality of Law. In *The Morality of Law*, Lon L. Fuller argues that law is subject to an internal morality consisting of eight principles: (P1) the rules must be expressed in general terms; (P2) the rules must be publicly promulgated; (P3) the rules must be (for the most part) prospective in effect; (P4) the rules must be expressed in understandable terms; (P5) the rules must be consistent with one another; (P6) the rules must not require conduct beyond the powers of the affected parties; (P7) the rules must not be changed so frequently that the subject cannot rely on them; and (P8) the rules must be administered in a manner consistent with their wording (Fuller 1964, p. 39).

On Fuller's view, no system of rules that fails minimally to satisfy these principles of legality can achieve law's essential purpose of achieving social order through the use of rules that guide behavior. A system of rules that fails to satisfy (P2) or (P4), for example, cannot guide behavior because people will not be able to determine what the rules require. Accordingly, Fuller concludes that his eight principles are "internal" to law in the sense that they are built into the existence conditions for law: "A total failure in any one of these eight directions does not simply result in a bad system of law; it results in something that is not properly called a legal system at all" (Fuller 1964, p. 39).

These internal principles constitute a morality, according to Fuller, because law necessarily has positive moral value in two respects: (1) law conduces to a state of social order and (2) does so by respecting human autonomy because rules *guide* behavior. Since no system of rules can achieve these morally valuable objectives without minimally complying with the principles of legality, it follows, on Fuller's view, that they constitute a morality. Since these moral principles are built into the existence conditions for law, they are internal and hence represent a conceptual connection between law and morality that is inconsistent with the separability thesis.

Hart responds by denying Fuller's claim that the principles of legality constitute an internal morality; on Hart's view, Fuller confuses the notions of morality and efficacy:

> [T]he author's insistence on classifying these principles of legality as a "morality" is a source of confusion both for him and his readers.... [T]he crucial objection to the designation of these principles of good legal craftsmanship as morality, in spite of the qualification "inner," is that it perpetrates a confusion between two notions that it is vital to hold apart: the notions of purposive activity and morality. Poisoning is no doubt a purposive activity, and reflections on its purpose may show that it has its internal principles. ("Avoid poisons however lethal if they cause the victim to vomit"....) But to call these principles of

> the poisoner's art "the morality of poisoning" would simply blur the distinction between the notion of efficiency for a purpose and those final judgments about activities and purposes with which morality in its various forms is concerned (Hart 1965, pp. 1285-86).

On Hart's view, all actions, including virtuous acts like lawmaking and impermissible acts like poisoning, have their own internal standards of efficacy. But insofar as such standards of efficacy conflict with morality, as they do in the case of poisoning, it follows that they are distinct from moral standards. Thus, while Hart concedes that something like Fuller's eight principles are built into the existence conditions for law, he concludes that they do not constitute a conceptual connection between law and morality.

Unfortunately, Hart's response overlooks the fact that most of Fuller's eight principles double as moral ideals of fairness. For example, public promulgation in understandable terms may be a necessary condition for efficacy, but it is also a moral ideal; it is morally objectionable for a state to enforce rules that have not been publicly promulgated in terms reasonably calculated to give notice of what is required. Similarly, we take it for granted that it is wrong for a state to enact retroactive rules, inconsistent rules, and rules that require what is impossible. Poisoning may have its internal standards of efficacy, but such standards are distinguishable from the principles of legality in that they conflict with moral ideals.

Nevertheless, Fuller's principles operate internally, not as moral ideals, but merely as principles of efficacy. As Fuller would likely acknowledge, the existence of a legal system is consistent with considerable divergence from the principles of legality. Legal standards, for example, are necessarily promulgated in general terms that inevitably give rise to problems of vagueness. And officials all too often fail to administer the laws in a fair and even-handed manner-even in the best of legal systems. These divergences may always be *prima facie* objectionable, but they are inconsistent with a legal system only when they render a legal system incapable of performing its essential function of guiding behavior. Insofar as these principles are built into the existence conditions for law, it is because they operate as efficacy conditions-and not because they function as moral ideals.

Fuller's jurisprudential legacy, however, should not be underestimated. While positivists have long acknowledged that law's essential purpose is to guide behavior through rules (e.g., John Austin writes that "[a] law ... may be defined as a rule laid down for the guidance of an intelligent being by an intelligent being having power over him" Austin 1977, p. 5), they have not always appreciated the implications of this purpose. Fuller's lasting contribution to the theory of law was to flesh out these implications in the form of his principles of legality.

Positivism and Legal Principles. Dworkin argues that, in deciding hard cases, judges often invoke legal principles that do not derive their authority from an official act of promulgation (Dworkin 1977, p. 40). These principles, Dworkin believes, must be characterized as law because judges are bound to consider them when relevant. But if unpromulgated legal principles constitute law, then it is false, *contra* the pedigree thesis, that a proposition of law is valid only in virtue of having been formally promulgated.

According to Dworkin, principles and rules differ in the kind of guidance they provide to judges:

> Rules are applicable in an all-or-nothing fashion. If the facts a rule stipulates are given, then either the rule is valid, in which case the answer it supplies must be accepted, or it is not, in which case it contributes nothing to the decision.... But this is not the way principles operate.... [A principle] states a reason that argues in one direction, but does not necessitate a particular decision (Dworkin 1977, pp. 24-25).

On Dworkin's view, conflicting principles provide competing reasons that must be weighed according to the importance of the respective values they express. Thus, rules are distinguishable from principles in

two related respects: (1) rules necessitate, where principles only suggest, a particular outcome; and (2) principles have, where rules lack, the dimension of weight.

Dworkin cites the case of *Riggs v. Palmer* as representative of how judges use principles to decide hard cases. In *Riggs*, the court considered the question of whether a murderer could take under the will of his victim. At the time the case was decided, neither the statutes nor the case law governing wills expressly prohibited a murderer from taking under his victim's will. Despite this, the court declined to award the defendant his gift under the will on the ground that it would be wrong to allow him to profit from such a grievous wrong. On Dworkin's view, the court decided the case by citing "the principle that no man may profit from his own wrong as a background standard against which to read the statute of wills and in this way justified a new interpretation of that statute" (Dworkin 1977, p. 29).

The positivist might respond that when the *Riggs* court considered this principle, it was reaching beyond the law to extralegal standards in the exercise of judicial discretion. But Dworkin points out that the *Riggs* judges would "rightfully" have been criticized had they failed to consider this principle; if it were merely an extralegal standard, there would be no rightful grounds to criticize a failure to consider it (Dworkin 1977, p. 35). Accordingly, Dworkin concludes that the best explanation for the propriety of such criticism is that principles are part of the law.

Further, Dworkin maintains that the legal authority of standards like the *Riggs* principle cannot derive from promulgation in accordance with purely formal requirements: "[e]ven though principles draw support from the official acts of legal institutions, they do not have a simple or direct enough connection with these acts to frame that connection in terms of criteria specified by some ultimate master rule of recognition" (Dworkin 1977, p. 41). Unlike legal rules, legal principles lack a canonical form and hence cannot be explained by formal promulgation.

On Dworkin's view, the legal authority of a binding principle derives from the contribution it makes to the best moral justification for a society's legal practices considered as a whole. According to Dworkin, a legal principle maximally contributes to such a justification if and only if it satisfies two conditions: (1) the principle coheres with existing legal materials; and (2) the principle is the most morally attractive standard that satisfies (1). The correct legal principle is the one that makes the law the moral best it can be. Thus, Dworkin concludes, "if we treat principles as law we must reject the positivists' first tenet, that the law of a community is distinguished from other social standards by some test in the form of a master rule" (Dworkin 1977, p. 44).

In response, positivists concede that there are legal principles, but argue that their authority as law can be explained in terms of the conventions contained in the rule of recognition:

> Legal principles, like other laws, can be enacted or repealed by legislatures and administrative authorities. They can also become legally binding through establishment by the courts. Many legal systems recognize that both rules and principles can be made into law or lose their status as law through precedent (Raz 1972, p. 848).

According to this view, legal principles are like legal rules in that both derive their authority under the rule of recognition from the official acts of courts and legislatures. If the *Riggs* principle that no person shall profit from her own wrong has legal authority, it is because that principle was either declared by a court in the course of adjudicating a dispute or formally promulgated by the appropriate legislative body.

Further, inclusive positivists argue that Dworkin's account of principles is itself consistent with the pedigree thesis. As Hart puts it, "this interpretative test seems not to be an alternative to a criterion provided by a rule of recognition, but ... only a complex 'soft-positivist' form of such a criterion

identifying principles by their content not by their pedigree" (Hart 1994, p. 263). The idea, familiar from Section II, is that a rule of recognition can incorporate content-based constraints on legal validity, even those rooted ultimately in morality.

The Semantic Sting. In *Law's Empire,* Dworkin distinguishes two kinds of disagreement legal practitioners can have about the law. Lawyers can agree on the criteria a rule must satisfy to be legally valid, but disagree on whether those criteria are satisfied by a particular rule. For example, two lawyers might agree that a rule is valid if enacted by the state legislature, but disagree on whether the rule at issue was actually enacted by the state legislature. Such disagreements are empirical in nature and hence pose no theoretical difficulties for positivism.

There is, however, a second kind of disagreement that Dworkin believes is inconsistent with positivism. Lawyers often agree on the facts about a rule's creation, but disagree on whether those facts are sufficient to endow the rule with legal authority. Such disagreement is considerably deeper than empirical disagreement as it concerns the criteria for legal validity-which, according to positivism, are exhausted by the rule of recognition. Dworkin calls this second kind of disagreement theoretical disagreement about the law.

Theoretical disagreement, on Dworkin's view, is inconsistent with the pedigree thesis because the pedigree thesis explains the concept of law in terms of shared criteria for creating, changing and adjudicating law:

> If legal argument is mainly or even partly about [the properties that make a proposition legally valid], then lawyers cannot all be using the same factual criteria for deciding when propositions of law are true and false. Their arguments would be mainly or partly about which criteria they should use. So the project of the semantic theories, the project of digging out shared rules from a careful study of what lawyers say and do, would be doomed to fail (Dworkin 1986, p. 43).

If lawyers disagree about the criteria of legal validity, then the grounds of legal validity cannot be exhausted by the shared criteria contained in a rule of recognition. The semantic sting, then, implies that there must be more to the concept of legal validity than can be explained by promulgation in accordance with shared criteria embodied in a rule of recognition.

The semantic sting resembles one of Dworkin's earlier criticisms of Hart's pedigree thesis. Hart believes that the rule of recognition is a social rule and is hence constituted by the conforming behavior of people who also accept the rule as a ground for criticizing deviations. Like all social rules, then, the rule of recognition has an external and internal aspect. The external aspect of the rule of recognition consists in general obedience to those rules satisfying its criteria of validity; the internal aspect is constituted by its acceptance as a public standard of official behavior. Hart believes it is this double aspect of the rule of recognition that accounts for its normativity and enables him to distinguish his theory from Austin's view of law as a system of coercive commands. For, as Hart points out, a purely coercive command can oblige, but never obligate, a person to comply (see Section I, *supra*).

Dworkin argues that this feature of Hart's theory commits him to the claim that there cannot be any disagreement about the content of rule of recognition:

> Hart's qualification ... that the rule of recognition may be uncertain at particular points ... undermines [his theory].... If judges are in fact divided about what they must do if a subsequent Parliament tries to repeal an entrenched rule, then it is not uncertain whether any social rule [of recognition] governs that decision; on the contrary, it is certain that none does

> (Dworkin 1977, pp. 61-62).

On Dworkin's view, the requirements of a social rule cannot be uncertain since a social rule is constituted by acceptance and conforming behavior by most people in the relevant group: "two people whose rules differ ... cannot be appealing to the same social rule, and at least one of them cannot be appealing to any social rule at all" (Dworkin 1977, p. 55).

Jules Coleman responds that if the rule of recognition is a social rule, then Hart's view implies there must be general agreement among the officials of a legal system about what standards constitute the rule of recognition, but it does not imply there cannot be disagreement as to what those standards require in any given instance:

> The controversy among judges does not arise over the content of the rule of recognition itself. It arises over which norms satisfy the standards set forth in it. The divergence in behavior among officials as exemplified in their identifying different standards as legal ones does not establish their failure to accept the same rule of recognition. On the contrary, judges accept the same truth conditions for propositions of law.... They disagree about which propositions satisfy those conditions (Coleman 1982, p. 156).

Coleman, then, distinguishes two kinds of disagreement practitioners can have about the rule of recognition: (1) disagreement about what standards constitute the rule of recognition; and (2) disagreement about what propositions satisfy those standards. On Coleman's view, Hart's analysis of social rules implies only that (1) is impossible.

Under the U.S. rule of recognition, for example, a federal statute is legally valid if and only if it has been enacted in accordance with the procedural requirements described in the body of the Constitution and is consistent with the first fourteen amendments. Since, on Hart's view, the U.S. rule of recognition is a social rule, U.S. officials must agree on the procedures the federal government must follow in enacting law, the set of sentences constituting the first fourteen amendments, and the requirement that federal enactments be consistent with those amendments.

But Hart's view of social rules does not imply there cannot be any disagreement about whether a given enactment is consistent with the first fourteen amendments. Legal practitioners can and do disagree on what Hart calls penumbral (or borderline) issues regarding the various amendments. While every competent practitioner in the U.S. would agree, for example, that torturing a person to induce a confession violates the fifth amendment right against self-incrimination, there is considerable disagreement about whether compelling a defendant to undergo a psychiatric examination for the purpose of increasing her sentence also violates that right. On Coleman's view, there is nothing in Hart's analysis of social rules that precludes such borderline disagreements about whether a practice is consistent with the Fifth Amendment.

Despite its resemblance to this earlier criticism, Dworkin's semantic sting argument takes aim at a deeper target. The semantic sting targets all so-called semantic theories of law that articulate the concept of law in terms of "shared rules ... that set out criteria that supply the word's meaning" (Dworkin 1986, p. 31). Thus, while the earlier criticism is directed at Hart's extraneous account of social rules, the semantic sting is directed at what Dworkin takes to be the very heart of positivism's theoretical core, namely, the claim that there are shared criteria that exhaust the conditions for the correct application of the concept of law.

At the root of the problem with semantic theories, on Dworkin's view, is a flawed theory of what makes disagreement possible. According to Dworkin, semantic theories mistakenly assume that meaningful disagreement is impossible unless "we all accept and follow the same criteria for deciding when our

claims are sound, even if we cannot state exactly, as a philosopher might hope to do, what these criteria are" (Dworkin 1986, p. 45). On this flawed assumption, two people whose concepts of law differ cannot be disagreeing about the same thing.

Perhaps with Coleman's response to his earlier criticism in mind, Dworkin concedes that semantic theories are consistent with theoretical disagreements about borderline or penumbral cases: "people do sometimes speak at cross-purposes in the way the borderline defense describes" (Dworkin 1986, p. 41). But Dworkin denies semantic theories are consistent with theoretical disagreement about pivotal (or core) cases:

> [According to semantic theories, y]ou and I can sensibly discuss how many books I have on my shelf, for example, only if we both agree, at least roughly, about what a book is. We can disagree over borderline cases: I may call something a slim book that you would call a pamphlet. But we cannot disagree over what I called pivotal cases. If you do not count my copy of *Moby-Dick* as a book because in your view novels are not books, any disagreement is bound to be senseless (Dworkin 1986, p. 45).

The problem, on Dworkin's view, is that many difficult appellate cases like *Riggs* involve theoretical disagreement about pivotal cases:

> The various judges who argued about our sample cases did not think they were defending marginal or borderline claims. Their disagreements about legislation and precedent were fundamental; their arguments showed that they disagreed not only about whether Elmer should have his inheritance, but about why any legislative act, even traffic codes and rates of taxation, impose the rights and obligations everyone agrees they do.... They disagreed about what makes a proposition of law true not just at the margin but in the core as well (Dworkin 1986, pp. 42-43).

On Dworkin's view, the judges in *Riggs* were not having a borderline dispute about some accepted criterion for the application of the concept of law. Rather, they were having a disagreement about the status of some putatively fundamental criterion itself: the majority believed, while the dissent denied, that courts have power to modify unambiguous legislative enactments.

Accordingly, theoretical disagreement about pivotal cases like *Riggs* is inconsistent with semantic theories of law, on Dworkin's view, because it shows that shared criteria do not exhaust the proper conditions for the application of the concept of law. For the majority and dissenting judges in *Riggs* were having a sensible disagreement about law even though it centered on a pivotal case involving the criteria of legal validity. Thus, Dworkin concludes, the concept of law cannot be explained by so-called criterial semantics.

In response, Hart denies both that his theory is a semantic theory and that it assumes such an account of what makes disagreement possible:

> [N]othing in my book or in anything else I have written supports [a semantic account] of my theory. Thus, my doctrine that developed municipal legal systems contain a rule of recognition specifying the criteria for the identification of the laws which courts have to apply may be mistaken, but I nowhere base this doctrine on the mistaken idea that it is part of the meaning of the word 'law' that there should be such a rule of recognition in all legal systems, or on the even more mistaken idea that if the criteria for the identification of the grounds of law were not uncontroversially fixed, 'law' would mean different things to different people (Hart 1994, p. 246).

Instead, Hart argues that his theory of law is "a descriptive account of the distinctive features of law in general as a complex social phenomenon" (Hart 1994, p. 246). Hart presents his theory, not as an account of how people apply the concept of law, but rather as an account of what distinguishes systems of law from other systems of social rules. On Hart's view, it is the presence of a rule of recognition establishing criteria of validity that distinguishes law from other systems of social rules. Thus, according to Hart, Dworkin's criticism fails because it mischaracterizes positivism as providing a criterial explanation of the concept of law.

Gottfried Wilhelm Leibniz (1646-1716)

Metaphysics

SECTIONS:

1. Life

Gottfried Wilhelm Leibniz was born in Leipzig, Germany, on July 1, 1646. He was the son of a professor moral philosophy, and after university study in Leipzig and elsewhere, it would have been natural for him to go into academia. Instead, he began a life of professional service to noblemen, primarily the dukes of Hanover (Georg Ludwig became George I of England in 1714, two years before Leibniz's death). His professional duties were various, such as official historian and legal advisor. Above all, he was required to (or allowed to) travel widely, meeting many of the foremost intellectuals in Europe - of particularly formative importance were the astronomer, mathematician and physicist Huygens, and the philosopher Spinoza.

Leibniz was one of the great polymaths of the modern world. Moreover, a list of his significant contributions is almost as long as the list of his activities. As an engineer he worked on calculating machines, clocks and even mining machinery. As a librarian he more or less invented the modern idea of cataloguing. As a mathematician he not only produced ground-breaking work in what is now called topology, but came up with the calculus independently of (though a few years later) than Newton, and his

notation has become the standard. In logic, he worked on binary systems among numerous other areas. As a physicist he made advances in mechanics, specifically the theory of momentum. He also made contributions to linguistics, history, aesthetics and political theory.

Leibniz's curiosity and genius ranged widely, but one of the most constant of his concerns was to bring about reconciliation by emphasizing the truths that lay in both of even the most contradictory positions. Throughout his life, he hoped that his work on philosophy (as well as his work as a diplomat) would form the basis of a theology capable of reuniting the Church, divided since the Reformation in the 16th Century. Similarly, he was willing to engage with, and borrow ideas from, the materialists as well as the Cartesians, the Aristotelians as well as the most modern scientists. It is quite ironic, then, that he was partial cause of a dispute between British and Continental mathematicians concerning who was first to the calculus (and who might have plagiarised who). This dispute slowed down the advance of mathematics in Europe for over a century.

However, the great variety of his work meant that, sadly, he completed few of his ambitious projects. For our purposes here, this means above all that Leibniz's rich and complex philosophy has to be gathered primarily from a large set of quite short manuscripts, many fragmentary and unpublished, as well has his vast correspondence. The last section of this entry gives bibliographical details of several editions of Leibniz's work.

Partly because of the above fact, a major controversy in Leibniz scholarship is the question of where to begin. Insofar as Leibniz is a logician, it is tempting to begin with his conception of truth (and, indeed, this will be our starting point). But insofar as Leibniz is a metaphysician, it is equally tempting to begin with his account of the nature of reality and in particular substance. Less common, but perhaps equally likely starting points might lie in Leibniz the mathematician, the theologian or the physicist. These controversies, however, already contain a lesson: to an important degree *it doesn't matter*. So integrated were his various philosophical interests - so tightly laced together into a *system* - that one ought to be able to begin anywhere and reconstruct the whole. Or at least Leibniz evidently thought so, since very often we find him using an idea from one part of his philosophy to concisely prove something in an apparently quite distant philosophical region. Likewise, just this systematic nature often makes 'getting into' Leibniz the most difficult step, because every idea seems to rely upon the others.

(Note: this entry will not be dealing with Leibniz's work on, for example, aesthetics, political philosophy, or [except incidentally] physics. Also, Leibniz 'mature' metaphysical career spanned over thirty years. During this period, it would be surprising if some of his basic ideas did not change. Remarkably, however, the broad outline of his philosophy does remain constant. Therefore, in this entry we will predominately taking the broad view.)

2. The Idea of Truth

Leibniz the logician would have us ask a seductively simple question: what is truth? It will turn out to be the case that a conception of what truth is has important consequences for a conception of what reality in general is, and how it is to be understood at its most profound level. Common-sensically, we say that a proposition is true when its content is adequate to the situation in the world to which it refers. So: 'the sky is grey' is true if and only if the thing out there in the world we call the sky is actually the colour we call grey at the time the proposition is stated. This, however, gets us into problems about the

relationship of language to the world, and what this 'adequacy' consists in. (Problems both sceptics and pragmatists are only too fond of drawing our attention to.)

Leibniz says that we can bypass all that, at least for the moment. Truth is simply a proposition in which the predicate is contained in the subject. The predicate is what is asserted; the subject is what is asserted about. So, formally speaking, Leibniz says, all true propositions can be expressed: 'subject is predicate'. This is not an idea unique to Leibniz by any means - what is unique is the single-mindedness with which he pursues the consequences of such an idea of truth. (See e.g. 'Correspondence with Arnauld', letter of July 14, 1686.)

This idea of truth seems straight-forward enough for what we now commonly call *analytic* propositions, such as 'Blue is a colour', which has nothing to do with the world, but is simply part of a definition of blue. The notion of colour is part of the notion of blue. Similarly, 'A = A', which is a basic logical truth. The predicate is not just contained in the subject, it *is* the subject. But Leibniz says that this 'being contained' is 'implicitly' or 'virtually' the case with other truths. ('Primary Truths', 'The Nature of Truth'.) Take the statement 'Peter is ill'. Usually, we take this proposition to be true only because it refers to a real world in which Peter is, in fact, ill. But Leibniz will analyse this as follows: if we knew everything there was to know about Peter, that is, if we had a *complete concept* of Peter, we would also know (among many other things) that he is ill at the moment. Therefore, the statement 'Peter is ill' is true not *primarily* because of some reference to the world, but in the first instance because we or someone has the concept of Peter, which is the subject of the proposition, and that concept contains (as a predicate) his being ill. Of course, it may be the case that we *happen to know* that Peter was ill *because* we refer to the world (perhaps we see him cough repeatedly). But the fact that we find out about Peter in this way does not make the statement that 'Peter is ill' true and thus a piece of knowledge because of that reference. We must distinguish the concept of truth from pragmatic or methodological issues of how we happen to find out about that truth, or what we can do with the truth. The latter are completely irrelevant to the question of what is truth (or knowledge) in itself.

Leibniz also wants to claim that a statement is true for all time - that is, whenever the statement is made. So, the statement 'Peter is ill (on January 1st, 1999)' was true in the year 1998 (although neither we, nor Peter, knows it yet) as well as in the year 2000 (although we and Peter may have forgotten about the illness by then). It was also true a million years ago, and will be true a million years from now, although it is very unlikely that anyone will actually *know* this truth at those times.

Leibniz's own example was Julius Caesar (*Discourse on Metaphysics,* §13). He writes,

> *For if some person were capable of completing the whole demonstration by means of which he could prove this connection of the subject (which is Caesar) with the predicate (which is his successful enterprise* [winning the battle of Pharsalus, etc.]*), he would then show that the future dictatorship of Caesar had its foundation in his notion or nature, that a reason can be found there why he resolved to cross the Rubicon rather than stop, and why he won rather than lost the day at Pharsalus...*

But there are several further ideas Leibniz introduces in this passage which we need to explore. What is meant by 'completing the whole demonstration'? Or by something having a 'foundation', or by 'a reason can be found'?

3. Sufficient Reason

As we have just seen, for any proposition truth is defined in the same way: the predicate contained in the subject. It only takes a little thought to realise that for any one subject (like Peter, or Caesar), the number of predicates which are true of it will be infinite (or at least very large!), for they must include every last thing Peter or Caesar did or will do, and also everything that did or will ever *happen to them*. Why do all these predicates come together in the one subject? It could be that the predicates are a quite arbitrary or random collection. Leibniz does not believe this - and it is certainly not how we normally think. Rather, we normally think that one predicate or set of predicates explains another. For example, Peter's coming into contact with a virus explains his illness. Or, Caesar's ambition and boldness explains why he decided to cross the Rubicon. So, many (at least) of the predicates that are true of a subject 'hang together' as a network of explanations.

Leibniz goes further still: for *every* predicate that is true of a subject, there will be a set of other true predicates which constitute a *sufficient reason* for its being true. This he calls 'the principle of sufficient reason'. This is why he uses words like 'foundation' and 'reason' in the quotation above. Unless this were true, Leibniz feels, the universe would not make any sense, and science and philosophy both would be impossible (see, e.g. *New Essays on Human Understanding*, preface, p. 66). Moreover, it would impossible to account for a basic notion like *identity* unless there were a sufficient reason why I (with my particular properties now) am identical with that 'me' who existed a week ago (and had such different properties). ('Remarks on Arnauld's Letter...', May 1686)

This idea of sufficient reason accounts for why Leibniz talks about about 'completing the whole demonstration'. If the *complete concept* of the subject (all of its true predicates) together constitutes a complete network of explanation, then these explanations can be followed forwards and backwards, at least in principle. That is, someone could *deduce* Caesar's crossing of the Rubicon from a full picture of his previous predicates; or, working backwards, deduce from a full picture of those predicates true of Caesar at his death the reasons why he won the battle of Pharsalus. The 'whole demonstration', then, would be a revelation of the logical structure of the network of explanations that make Caesar who he is.

At least in principle! Clearly, this is not something that you or I can do. Human minds are not subtle and capacious enough for a task which may be infinite. Still, in our more limited way, we happily talk about 'personalities', 'characters', and causes or reasons for things. The quotation from Leibniz given above continues:

> ... [he who completed the whole demonstration would then show] *that it was rational and therefore definite that this would happen, but not that it is necessary in itself, or that the contrary implies a contradiction.*

These qualifications are very important for Leibniz. It was often suggested by Leibniz's contemporaries (and is still being suggested!) that his idea of the sufficient reason of all the predicates of a subject meant that everything true of a subject is *necessarily* true. This might entail that Caesar did not 'choose' to cross the Rubicon, but that he was acting in a determined manner, like a machine. In other words, Leibniz seems to be denying anything like *free will*. We will return to the free will problem below, but for the moment, a few observations.

First, Leibniz claims that Caesar's crossing of the Rubicon is not necessary in the sense that 'A is A' is necessary. Because while 'A is not A' is a contradiction, Caesar's deciding not to cross the Rubicon does

not imply a contradiction. To be sure, history would have been different - even Caesar would have been different - but there is no contradiction in that strong sense. Caesar's properties are not *logically necessary*.

Second, any truth about Caesar - indeed, the whole complete concept of Caesar - is not 'necessary in itself'. Caesar is Caesar, but nothing about Caesar in himself proves that Caesar *has to be*. By contrast, 'A is A' doesn't need any other explanation for its truth. So, while every property of Caesar is explained by some other property of Caesar, no property explains why it is true that 'Caesar existed'. Caesar is not *necessary being*.

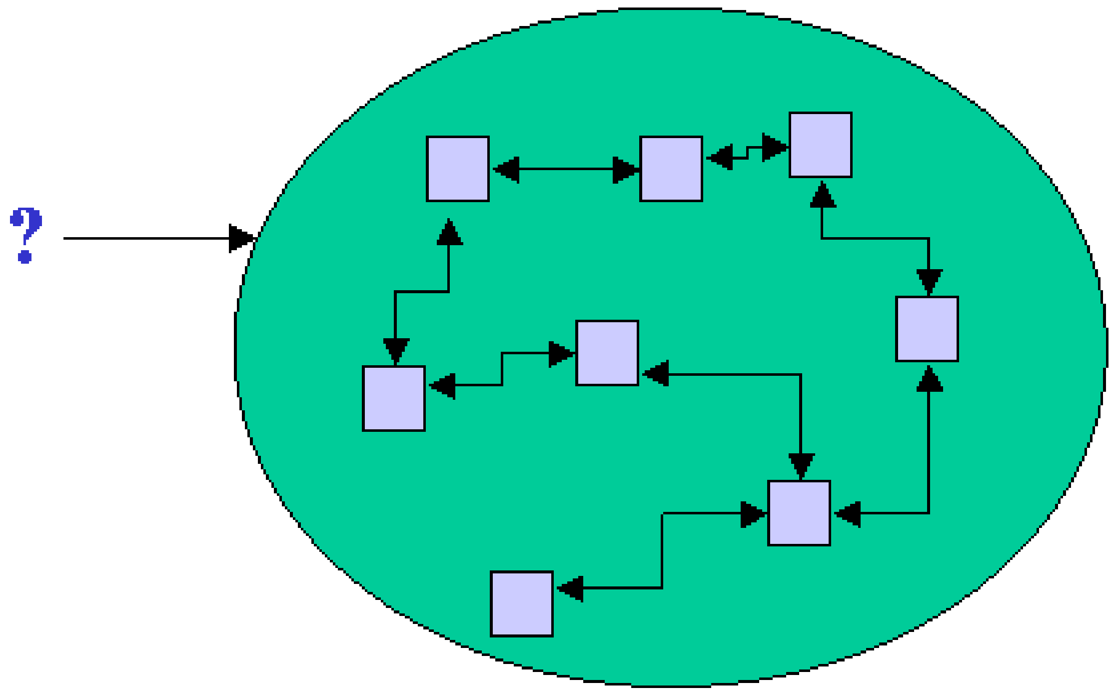
It remains a strenuously debated issue in Leibniz scholarship what the exact nature of these distinctions is, whether he is justified in making them, and - even if justified - do they yield the results he claims in the area of free will. We will add more detail to this account, but the existence of this debate should be kept in mind throughout.

4. Substance, briefly.

At this point, we must turn from a conception of truth to a conception of substance - a subject which has been just out of sight in the above. We will not deal with Leibniz's full philosophy of substance until section 8. For the moment, we have only to observe that, for humans (though not for God), complete concepts are always concepts 'of' existing substances - that is, 'of' really existing things. Leibniz writes:

> *Now it is obvious that* all true predication has some foundation in the nature of things*, and when a proposition is not identical, that is to say when the predicate is not expressly included in the subject, it must be virtually included in it.* [...] *This being so, we can say that the nature of an individual substance or of a complete being is* to have a notion so complete *that it is sufficient to include, and to allow the deduction of, all the predicates of the subject to which that notion is attributed.* [*Discourse on Metaphysics*, §8, my emphasis]

To be the individual substance Caesar, then, is to be such as to have a notion which includes everything that can truthfully be predicated of the subject 'Caesar'. We might say that substance means a complete concept made real; and a complete concept means a real substance 'expressed' or 'perceived' in thought. Moreover, just as for any one predicate, the complete concept contains other predicates which explain that predicate - so, for any given property of a substance, the complete individual substance will itself be the explanation for that property. Caesar chose to cross the Rubicon for many complex reasons, but they all boil down to this: that was the kind of man Caesar was.



As we shall see below, Leibniz has much more to say about substance - but he claims that it all follows from this insight. However, the exact relationship Leibniz intended between the logical idea of a complete concept, and the metaphysical idea of a substance is still hotly debated in Leibniz scholarship.

5. Necessary Being

The complete concept of Caesar cannot explain itself in its entirety; expressed ontologically, this means that Caesar himself provides no explanation of why Caesar should have existed at all - Caesar is *contingent being*. By 'contingent' is meant something that could have been otherwise; that is, here, something that could have not existed at all. The principle of sufficient reason, if we accept it, must not only apply to each predicate in the complete concept of a subject. But also it must apply to the concept

itself in its entirety as the concept of an *existing* thing. Why should this substance exist, rather than some other substance, or nothing at all? What explains Caesar? Possibly other complete substances, such as his parents; and they in turn are explained by still others.

But the entire course of the universe, the total aggregate of substances across space and time are one and all contingent. There are other possible things, to be sure; but there are also other possible *universes* that could have existed but did not. The totality of contingent things themselves do not explain themselves. Here again, the principle of sufficient reason applies. There must be, Leibniz insists, something *outside the totality of contingent things* which explains them, something which is itself necessary and therefore requires no explanation other than itself. Note that we are not assuming an origin or beginning in any sense. Even if time stretched infinitely into the past, there would still be no explanation for the total course of things.

The properties of every monad in the universe, just like the properties within any one monad, are all interconnected in a vast network of explanation, according to the law of sufficient reason. But what is the reason for the whole set of monads – what explains the existence and nature of the universe itself?

This forms a proof for the existence of God. (*Monadology* §37-9, 'A Specimen of Discoveries') In fact, it is a version of the third of the cosmological arguments given by St Thomas Aquinas - and subject to many of the same difficulties. One might, for example, object in a Kantian vein that the concept of explanation, rightly demanded of all individual contingent beings, is applied beyond its proper sphere in demanding an explanation of the *totality* of contingent beings. But Leibniz might well counter that this object assumes a whole theory of the 'proper spheres' of concepts.

God, then, is the necessary being which constitutes the explanation of contingent being, why the universe is this way rather than any other. For the moment, God's necessity is the only thing we know about such being. (We, with Leibniz, say 'God', although there is not much religious or theological about this bare metaphysical concept.) God as a being may be necessary, but if the contingent universe were simply a

random or arbitrary act of God, then God would not constitute the required explanation of all things. In other words, God must not only be necessary, but also *the source of the intelligibility of all things*. It must be possible, therefore, to inquire into the reasons God had for 'authorising' or allowing this, rather than any other, universe to be the one that actually exists. And if God is to be the explanation of the intelligibility of the universe, then God must have 'access' to that intelligibility, such that God could be said to know what it is that is being allowed to exist - that is, God must have the ability to grasp complete concepts, and to see at once the 'whole demonstration' we talked about above. God so far is therefore (i) necessary being, (ii) the explanation of the universe, and (iii) the infinite intelligence.

Here Leibniz famously brings in the notion of perfection. (See e.g. 'A Specimen of Discoveries') We have to try to imagine God, outside of time, contemplating the infinite universe that 'he' is going to - not create - but *allow* to be actual and sustain in existence. In the mind of God are an infinite number of infinitely complex complete concepts, all considered as possibly existent substances, with none having any particular 'right' to exist. There is just one constraint on this decision: it must not violate the other basic principle of Leibniz's: non-contradiction. In other words, each substance may 'individually' be possible, but they must all be possible together - the universe forming a vast, integrated *system*. For example, God could not create a universe in which there were *both* more sheep than cows *and* more cows than sheep. God could choose a universe in which there is the greatest possible quantity of pizza; or in which everything is purple; or whatever. God, however, chooses the universe that is the *most perfect*, and this principle of perfection is not surprising since it is most consummate with the idea of God as an infinite being. To choose any other less perfect universe would be to choose a lesser universe. Thus, the existing world is the best of all possible worlds. (This claim, and its apparent implications were very effectively and famously satirised by Voltaire in his *Candide*. Note also that Leibniz is often taken as an ancestor of modern possible worlds semantics; however, it is undeniable that at least the context and purpose of Leibniz's notion of a possible universe was very different.) The theological consequences of this Leibniz explores at, for example, the end of the 'Discourse on Metaphysics'. (There may be a difficult theological implication: must God be thought of as *constrained*, first by the concept of perfection, and then by the systemic nature of his creation? Leibniz attempts, for example in the 'Correspondence with Arnauld' for example, to escape this conclusion.)

To try to understand further this notion of perfection, Leibniz tries out several concepts in various writings: notions of the best, the beautiful, the simply compossible, greatest variety or the greatest quantity of essence. The last of these is the explanation he keeps coming back to: perfection simply means the greatest quantity of essence, which is to say the greatest richness and variety in each substance, compatible with the least number of basic laws, so as to exhibit an intelligible order that is 'distinctly thinkable' in the variety ('A Resume of Metaphysics'; there is a relationship to the Medieval, and particularly Augustine, notion of 'plenitude'). Leibniz seems to understand this principle as just self-evident. It certainly seems to be a big jump to this aesthetic/moral/wise God from the ontological conception of God deduced above. Although Leibniz may have a point in arguing that it would be absurd in some sense for an infinite being to choose anything other than an infinitely rich and thus perfect universe. And he finds this aesthetic observed also throughout nature: that nature forms tend towards a maximum of variety compatible with orderliness. Never the less, contemporary philosophers generally find Leibniz's thought to be rather confused and even 'unphilosophical' at this point.

6. Problems of freedom, sin and evil.

But all this may cause more problems than it solves. If the complete concept of any being - such as a human being - is known for all time, and was chosen by God for existence. then is such a human being free in any sense. And if not, then what nonsense is made of the idea of morality or of sin? Further, it seems possible that what we mean by 'freedom' is that the outcome is not predictable, in the way that the operation of a washing machine, or of the addition of two numbers, is predictable. Why for example should God punish Adam and Eve for sinning when they clearly had no free choice - since God knew in advance (predicted - indeed *made it happen*) that they were going to sin?

To clear this up, Leibniz needs to distinguish between several ways in which things might be determined in advance. Whatever is determined is clearly true. Truth, however, come in several varieties. (Much of the following is taken from the set of distinctions Leibniz makes in 'Necessary and Contingent Truths'; Leibniz makes similar but rarely identical sets of distinctions in a variety of texts.)

1. Truths of Essence. These come in two varieties:
   - Primary or original truth: such as the law of non-contradiction.
   - Eternal or metaphysical or geometrical truths: laws of arithmetic or geometry, for example, which Leibniz claims can be reduced by a finite process of argumentation and substitution of definitions to primary truth. These are valid of *all possible universes*.
2. Truths of Existence or of Fact or of 'hypothesis'. Here, arguably, Leibniz sees four varieties:
   - 'Absolutely Universal' - those truths definitive of this universe as being the most perfect universe. Leibniz writes: 'Indeed, I think that in this series of things there are certain propositions which are true with absolute universality, and which cannot be violated even by a miracle.' ('Necessary and Contingent Truths')
   - Universal-physical truths: the laws of physics, and other such efficient causes, for example. The truths which hold universally of all substances in this, but *not* in all possible, universes - but which also could, in principle, be violated by a miracle, in accordance with overall divine providence.
   - 'Individual' metaphysical truths: truths about the properties of individual substances, where those properties follow indeed from the complete concept and thus are apparent to God, but do not follow any 'subordinate universal laws'. Deduction of such truths is available to no being, no matter how perfect or perceptive, other than God.

Only truths of essence can be 'necessary' absolutely and strictly speaking. All other truths, such as the actions of Caesar are only 'hypothetically' necessary - that is, only on the hypothesis that a universe exists as it is, with beings such as these in it. (See 'Discourse on Metaphysics' §13 and 'Correspondence with Arnauld', April 12th, 1686.) My actions are, therefore, not necessary by definition (regardless at this point of which type of 'truth of existence' they fall under). Thus the concept of me 'inclines without necessitating' (e.g. 'Discourse on Metaphysics' §30). Leibniz further writes:

> *For speaking absolutely, our will is in a state of indifference*, in so far as indifference is opposed to necessity, *and it has the power to do otherwise, or to suspend its action altogether, both alternatives being and remaining possible.* [...] *It is true, however, and indeed it is certain from all eternity, that a particular soul will not make use of this power on such and such an occasion.*

> *But whose fault is that? Does it have anyone to blame but itself?* ('Discourse on Metaphysics', §30, my emphasis)

By this 'indifference', Leibniz means a 'physical' indifference - that is to say, there is no universal-physical truth, as defined above, which governs human action. For Leibniz, that means that human action is further freed: the will has the power to suspend its action with respect to the physical sequence of efficient causes - but also even with respect to what would otherwise be seen as a decisive final cause. 'For they [free or intelligent substances] are not bound by any certain subordinate laws of the universe, but act as it were by a private miracle' ('Necessary and Contingent Truths'). Minds are different from mechanical causes. (As we shall see below, Leibniz goes against the trend of 17th and 18th century thought by reintroducing the Aristotelian and Scholastic notion of a final cause and, indeed, substantial forms.) Although Leibniz occasionally uses the analogy of a machine to describe the soul, the kinds of forces and causes operative in the former are simply inapplicable to the latter. Thus, if by individual free choice we mean: individual action that cannot be known in advance by even an infinitely subtle application of the laws of physics, chemistry, or biology - then we have free choice in that sense too.

Leibniz also here and there offers the following additional arguments for his particular conception of human free will:

1. Freedom as 'unpredictability' might be taken to mean freedom as an act uncaused. But this makes no sense, for free choice is not randomness. My free act has a cause - namely, me. Why should we complain when the individual concept of 'me' intrinsically determines what I do? Is this not what is meant by freedom? That I am the source of my action, and not anyone or anything else?

2. A necessary ignorance of future is practically, perhaps even logically, equivalent to freedom. As we know, grasping the full explanation of any predicate that lies in the complete concept is an infinite task. To help illustrate the distinction between contingent and necessary truths, Leibniz makes a famous analogy with the incommensurability of any whole number or fraction with a 'surd' (for example, the square root of two, the value of which cannot be represented numerically by any finite series of numbers.) For finite human minds, that incommensurability is a positive fact, just like contingency - no matter that for God neither 'calculation' is impossible, or even more difficult. Thus contingent truths can in principle be known from all time, but necessarily not by a human being. (See e.g. 'On Freedom'.) Leibniz writes: 'Instead of wondering about what you cannot know and what can tell you nothing, act according to your duty, which you do know.' ('Discourse on Metaphysics', §30) (It should be pointed out that this is somewhat more than an analogy, since it is closely related to the kinds of problems infinitesimal calculus was designed to deal with - and Leibniz takes the possibility of a calculus as having real metaphysical implications.)

3. A famous scholastic debate concerned the so-called 'Sloth Syllogism.' If everything is fated, the argument goes, then whatever action I 'do' will or will not happen whether or not I will it, therefore I need will nothing at all. I can just be a sloth, and let the universe happen. Leibniz thinks this is absurd - indeed, immoral. Individual will (what I will) matters. If I am the kind of person who is a sloth, then (everything else being the same) the course of my life will indeed be quite different than if I am the kind of person (like Caesar) who takes events by the scruff of the neck.

4. What many philosophers mean by 'contingent' is that an individual predicate 'could have been' different, and everything else the same. For Leibniz, this is impossible. To change one predicate means

to alter the *whole* complete concept/substance, and *with it the whole universe*. Leibniz thus claims that philosophers of a more radical sense of freedom do not take seriously the extent to which the universe is an *integrated network* of explanations, and that this in turn has implications for the idea of contingency. (See the discussion of Adam in Leibniz's letter to Landgraf Ernst von Hessen-Rheinfels, April 12, 1686.) Thus contingent events, even my free acts, must be part of the perfection of the universe - but that does not mean that all contingent events are so in the same way.

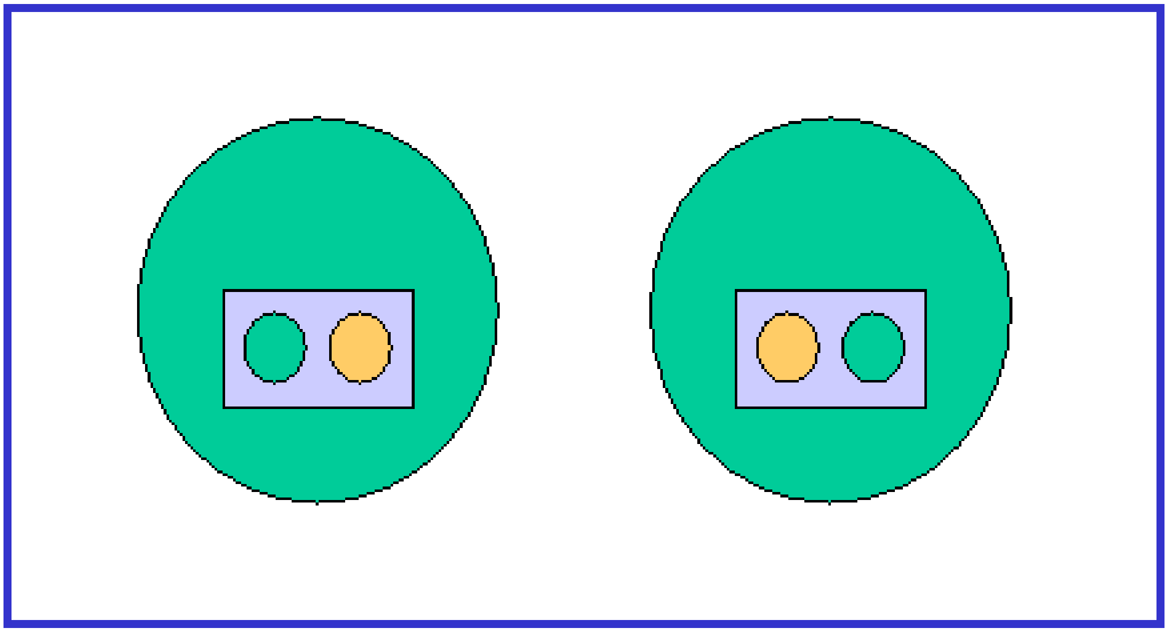
Any remaining objections to this idea are because we have a metaphysically incoherent idea of what freedom means, Leibniz claims. There is no question that Leibniz introduced a spirited and powerful position into the age-old philosophical debate concerning free will. Whose position is 'metaphysically incoherent', however, remains under debate, as we noted already above.

Leibniz's approach to the classic problem of evil is similar. If God is good, and the creator (or 'author') of the best possible universe, then why is the world full of pain and sin? Leibniz wants to claim that this apparent paradox is no real problem. His replies are to be found spread over many texts. Here, very briefly, are three: (i) We only see a small fraction of the universe. To judge it full of misery on this small fraction is presumptuous. Just as the true design - or indeed, *any* design - of a painting is not visible from viewing a small corner of it, so the proper order of the universe exceeds our ability to judge it. (ii) The best possible universe does not mean *no* evil, but that *less* overall evil is impossible. (iii) Similarly to the previous argument, and in the best Neo-Platonist tradition, Leibniz claims that evil and sin are *negations* of positive reality. All created beings are limitations and imperfect; therefore evil and sin are necessary for created beings. ('Discourse on Metaphysics', §30)

7. Space, Time and Indiscernibles

Between 1715 and 1716, at the request of Caroline, Princess of Wales, a series of long letters passed between Leibniz and the English physicist, theologian, and friend of Newton, Samuel Clarke. It is generally assumed that Newton had a hand in Clarke's end of the correspondence. They were published in Germany and in England soon after the correspondence ceased and became one of the most widely read philosophical books of the 18th Century. Leibniz and Clarke had several topics of debate: the nature of God's interaction with the created world, the nature of miracles, vacua, gravity and the nature of space and time. Although Leibniz had written about space and time previously, this correspondence is unique for its sustained and detailed account of this aspect of his philosophy. It is also worth pointing out that Leibniz (and after him Kant) continues a long tradition of philosophising about space and time from the point of view of space - as if the two were always in a strict analogy. It is only rarely that Leibniz deals in any interesting way with time on its own - we shall return to this in section 10.

Newton, and after him Clarke, argued that space and time must be absolute (that is, fixed 'background' constants) and in some sense really existence substances in their own right (at least, this was Leibniz's reading of Newton). The key argument is often called the 'bucket' argument. When an object moves, there must be some way of deciding upon a frame of reference for that motion. With linear motion, the frame does not matter (as far as the mathematics are concerned, it does not matter if the boat is moving away from the shore, or the shore is moving away from the boat); even linear acceleration (changing velocity but not direction) can be accounted for from various frames of reference. However, acceleration in a curve (to take Newton's example, water forced by the sides of a bucket to swirl in a circle, and thus to rise up the sides of the bucket), could only have one frame of reference. For the water



rising against the sides of the bucket can be understood if the water is moving within a stationary universe, but makes no sense if the water is stationary and the universe is spinning. Such curved acceleration requires the postulation of absolute space which makes possible fixed and unique frames of reference. (Similar problems made Einstein's General Theory of Relativity so much more mathematically complicated than the Special Theory.)

Leibniz has a completely different understanding of space and time.

Leibniz first of all finds the idea that space and time might be substances or substance-like absurd. (e.g. 'Correspondence with Clarke', Leibniz's Fourth Paper, §8ff) An empty space would be a substance with no properties; it will be a substance that even God cannot modify or destroy. But Leibniz's most famous arguments lay in a different direction.

Let us return to sufficient reason. This law claims that every thing which happens has, at least in principle, an explanation of why it happened, and why this way rather than that. Every question 'why' has in principle an answer. From this principle, together with non-contradiction, Leibniz believes, follows a third: the *principle of the identity of indiscernibles*. Leibniz is fond of talking about leaves as an example. Two leaves often look absolutely identical. But, he argues, if 'two' things are alike in every respect, *then they are the same object, and not two things at all*. So, it must be the case that no two leaves are ever exactly alike.

But why should this be the case? For if they were in every way the same, but actually different, then there would be no sufficient reason (i.e. no possible explanation) why the first is where (and when) it is, and the second is where (and when) it is, and not the other way around. If, then, we posit the possible existence of two identical things (things that differ in number only. That is, we can count them, but that is all), then we also posit the existence of an absurd universe, one in which the principle of sufficient reason is not universally true. Leibniz often expresses this in terms of God. That is, if two things were identical, there would be for God no sufficient reason for choosing to put one in the first place, and the second in the second place. (Leibniz's argument relates to a scholastic debate centred around the colourful concept of 'Buridan's Ass'.)

If space is real separately from substances, then two substances can be indiscernibles and be in different locations – this entails a paradox. But, if space is a 'projection' of internal properties of substances, then two apparently indiscernible substances are really different by virtue of those properties which are perceived as spatial relations.

The same, however, can be said about empty space. Two portions of empty space are indiscernible, and therefore, according to Leibniz, they must be identical. But if space is to be real - or even an absolute framework for motion - then this clearly cannot be the case. Again, on the Newton/ Clarke account, Leibniz argues, it would make sense to ask why the whole universe was created *here* instead of two meters *that-a-way*. But since these two universes are indiscernible, the question 'why' cannot make sense. This should be understood as a *reductio ad absurdum* of the Newtonian position.

That is the negative portion of Leibniz's argument. But what does all this say about space? For Leibniz, the location of an object is not a property of an independent space, but a property of the located object itself - and also of every other object relative to it. This means that an object here can indeed be different from an object located elsewhere simply by virtue of its different location - because that location is a real property of it. That is, space and time are internal features of the complete concepts of things, and not extrinsic. Let us go back to the two identical leaves. All of their properties are the same, except that they are in different locations. But that fact alone makes them completely different substances. To swap them while the rest of the universe wasn't looking would not be just to move things in an indifferent space, but would be to *change the things themselves*. If the leaf were located elsewhere, it would be a different leaf. A change of location is a change in the object itself. Similarly, with location in time.

This has two implications. First, that there is *no absolute location in either space or time,* location is always the situation of an object or event relative to other objects and events. Secondly, space and time are not in themselves real, are not substances. Space and time are ideal. Space and time are just ways

(metaphysically illegitimate ways) of perceiving certain virtual relations between substances. They are 'phenomena'; that is, in an important sense illusions - although they are illusions that are well-founded upon the internal properties of substances. Thus 'illusion' and 'science' are fully compatible. For God, who can grasp all at once the complete concept, there is not only no space but also no temptation of an illusion of space. Leibniz uses the analogy of the experience of a building as opposed to its blueprint, its overall design. (E.g. 'Correspondence with Arnauld', April 12th, 1686, *Monadology* §57) It is sometimes convenient to think of space and time as something 'out there', but this convenience must not be confused with reality. Space is nothing but the order of co-existent objects; time nothing but the order of successive events. This is usually called a *relational theory* of space and time.

Space and time, then, are the hypostatisations of ideal relations - which are real insofar as they symbolize real differences in substances; but illusions to the extent that (i) we take space or time as a thing in itself, or (ii) we believe spatial/temporal relations to be irreducibly exterior to substances, or (iii) we take extension or duration to be a real or even fundamental property of substances.

This raises a serious logical problem for Leibniz. Above, we talked about truth as the containedness of a predicate in a subject. This seemed acceptable, perhaps, for propositions such as 'Caesar crossed the Rubicon' or 'Peter is ill'. But what about 'This leaf is *to the left of* that leaf'. That proposition involves not one subject, but three (the two leaves, and whatever is occupying the point-of-view from which the one is 'to the left'). Leibniz has to argue that all *relational predicates* are in fact reducible to 'internal' properties of each of the three substances. This includes time, as well as relations such as 'the sister of' or 'is angry at'. But can *all* relations be so reduced, at least without radically deforming their sense? Modern logicians often see this as the major flaw in Leibniz's logic and, by extension, in his metaphysics.

Take the analogy of a virtual reality computer. What we see on the screen (or in the specially designed VR headset) is the illusion of space and time. Within the computer's memory are just numbers (and ultimately mere binary information) linked together. These numbers describe in an *essentially non-spatial and temporal way* a virtual space and time, within which things can 'be', 'move' and 'do things'. For example, in the computer's memory might be stored the number seven, corresponding to a bird. This in turn is linked to four further numbers representing three dimensions of space and one of time - that is, the bird's position. Suppose further the computer contains also the number one, corresponding to me, the viewer - and again linked to four further numbers for my position, plus another three giving the direction in which my virtual eyes are looking. The bird appears in my headset, then, when the fourth number associated with the bird is the same as my fourth number (we are together in time), and when the first three numbers of the bird (its position in virtual space) are in a certain algebraic relation to the number representing my position and point of view. Space and time are reduced to non-spatial and non-temporal numbers. For Leibniz, God in this analogy apprehends these numbers *as numbers*, rather than through their 'translation' into space and time. Leibniz is the first philosopher of virtual reality.

So how does Leibniz respond to the Newtonian 'bucket' argument? Leibniz thinks this is no problem, although philosophers certainly still debate the issue. He believes that we have simply to provide a rule for the reduction of relations. For linear motion the virtual relation is reducible to either or both the object and the universe around it. For non-linear motion, we must posit a rule such that the relation is not symmetrically reducible to either of the subjects (bucket, or universe around it). Rather, non-linear

motion is assigned only when, and precisely to the extent that, the one subject shows the effects of the motion. That is, the motion is a property of the water, if the water shows the effects. ('Correspondence with Clarke', Leibniz's Fifth Paper, §53) Perhaps it seems strange that the laws of nature should be different for linear as opposed to non-linear motion. It sounds like an *arbitrary* new law of nature, but Leibniz might respond that it is no more arbitrary that any other law of nature - just that we have become so used to the illusion of space that we are not used to thinking in these terms.

8. Substance as monad.

We are now, finally, ready to get a picture of what Leibniz thinks the universe is really like. It is a strange, and strangely compelling, place. Around the end of the Seventeenth Century, Leibniz famously began to use the word '*monad*' as his name for substance. 'Monad' means that which is one, has no parts and is therefore indivisible. These are the fundamental existing things, Leibniz thinks - his theory of monads is meant to be a superior alternative to the theory of atoms that was becoming very popular in natural philosophy. Leibniz has many reasons for distinguishing monads from atoms - the easiest to understand is perhaps that while atoms are meant to be the smallest unit of extension out of which all larger extended things are built, monads are unrelated to extension (remember, space is an illusion).

We must begin to understand what a monad is by beginning from the idea of a complete concept. As we said above, a substance/ monad is that reality which the complete concept represents. A complete concept contains within itself all the predicates that are true of the subject of which it is the concept, and these predicates are related by sufficient reasons into a vast single network of explanation. So, relatedly, the monad must not only exhibit properties, but contain within itself 'virtually' or 'potentially' all the properties it will exhibit in the future, and also contain the 'trace' of all the properties it did exhibit in the past. In Leibniz's extraordinary phrase, found frequently in his later work, the monad is 'pregnant' with the future and 'laden' with the past. (e.g. *Monadology* §22) All these properties are 'folded' up within the monad, and they unfold when and as they have sufficient reason to do so. (e.g. *Monadology* §61) The network of explanation is indivisible - to divide it would either leave some predicates without a sufficient reason, or merely separate two substances that never belonged together in the first place. Correspondingly, the monad is one, 'simple' and indivisible.

Just as in the analysis of space and time we discovered that all relational predicates are actually interior predicates of some complete concept, so the monad's properties will include all of its 'relations' to every other monad in the universe. A monad, then, is self-sufficient. Having all these properties within itself, it doesn't 'need' to be actually related to or influenced by another other monad. Leibniz writes:

> *So if I were capable of considering distinctly everything which is happening or appearing to me now, I would be able to see in it everything which will ever happen or appear to me for all time. And it would not be prevented, and would still happen to me, even if everything outside me were destroyed, so long as there remained only God and me.* ('Discourse on Metaphysics', §14)

The monad that is me, for example, 'expresses' (but as an internal property of it) the fact that I now see various words on a computer screen. Normally, we would think of this as a cause and effect relation - the screen produces light which causes nerve impulses in my eyes, etc. But all this would happen irrespective of the actual existence of the screen! Therefore, just like space and time, cause and effect is a 'well-founded' illusion. We say that one thing (A) causes another (B) when the virtual relation between them is more clearly and simply expressed in A than in B. But metaphysically, it makes no

difference which way around we understand the relation, because the relation itself is not real. Leibniz writes:

> *Thus, in strict metaphysical precision, we have no more reason to say that the ship pushes the water to produce this large number of circles ... than to say that the water is caused to produce all these circles and that it causes the ship to move accordingly.* ('Draft letter to Arnauld', 8th December 1686)

Leibniz goes on to insist that the first direction of explanation is much simpler, since the second would involve leaping directly to the action of God to explain the extraordinary action of so many individual bits of water. But that simplicity is hardly the same as truth.

So, instead of cause and effect being the basic agency of change, Leibniz is offering a theory of *pre-established harmony* to understand the apparently inter-related behaviour of things. Consider the common analogy of two clocks. The two clocks are on different sides of a room and both keep good time. Now, someone who didn't know how clocks work might suspect that one was the master clock and it *caused* the other clock to always follow it. When two things behave in corresponding ways, then we often assume (without any real evidence) that there is causation happening. But another person who knew about clocks would explain that the two clocks have no influence one on the other, but rather that they have a common cause (for example, in the last person to set and wind them). Since then, they have been independently running, not causing each other. On Leibniz's view, every monad is like a clock, behaving spontaneously in the way that it does, independently of other monads, but never the less tied into the others through the common reason: God and his vast conception of the perfect universe. (We must be careful, however, not to take this mechanical image of a clock too literally. Not all monads are explicable in terms of physical, efficient causes.) Leibniz has another extraordinary set of phrases for this: every monad 'expresses' every other, as if it were a 'mirror' of the universe, but no monad has a 'window' through which it could actually receive or supply causal influences. Relatedly, since a monad cannot be influenced, there is no way for a monad to be born or destroyed (except by God through a miracle - defined as something outside the natural course of events). All monads are eternal. (It is fair to say that Leibniz's attempt to account for what happens to 'souls' before the birth of body, and after its death, lead him to some colourful but rather strained speculations.)

Everything we perceive around us which is a unified being must be a single monad. Everything else is a composite of many monads. My coffee cup, for example, is made of many monads (an infinite number, actually). In everyday life, we tend to call it a single thing only because the monads all act together. My soul, however, and the soul of every other living thing, is a single monad which 'controls' a composite body. Leibniz thus says that at least for living things we must posit *substantial forms*, as *the principle of the unity* of certain living composites. (The term is derived from Aristotle: that which structures and governs the changes of mere matter in order to make a thing what it is. See e.g. 'A New System of Nature'.) My soul, a monad otherwise like any other monad, thus becomes the substantial form of my otherwise merely aggregate body.

9. Implications of Conceiving Substances as Monads

We will examine briefly four important implications of Leibniz's account of substance. First, the distinction between metaphysical truth and phenomenal description. Second, the idea of 'little perceptions'. Third, the infinitely composite nature of all body. Fourth, innate ideas.

I. Leibniz has to posit a distinction between levels or 'spheres' ('Discourse on Metaphysics', §10). The 'metaphysical' level is what is actually happening with monads (no causality, no space, no time at least as ordinarily understood, each monad spontaneously unfolding according to the kind of thing that it is). The 'phenomenal' or descriptive level is what appears to be happening because of our finite, imperfect minds (things cause one another, in space and time). Science's object is the latter, which is an illusion, but in which nothing happens that is not based upon what really happens in the metaphysical level (the illusion is 'well-founded'). Therefore, the laws of physics are perfectly correct, as a *description*. (Berkeley will borrow this idea (see especially his 'De Motu'); Kant will produce a highly original version of it.) Indeed, Leibniz believes, following Descartes and many other materialists, that all such laws are *mechanical* in nature, exclusively involving the interaction of momenta and masses. Thus his accusation that Newton's idea of gravity is merely 'occult'. Whereas, at the metaphysical level, no account of reality could be *less* mechanical! Not surprisingly, then, Leibniz's own contributions to physical science were in the fields of the theory of momentum, and engineering.

A serious error would arise only if we took the 'objects' of our science (matter, motion, space, time, etc.) as if they were real in themselves. Consider the following analogy: in monitoring a nation's economy, it is sometimes convenient to speak of a 'retail price index', which is a way of keeping track of the average change in the prices of millions of items. But there is nothing for sale anywhere which costs just that amount. As a measure it works well - provided we don't take it literally! Science, in order to be possible for finite minds, involves that kind of simplification or 'abbreviation' ('Letter to Arnauld', 30th April, 1687).

II. That the monad is the 'mirror' of the whole universe entails that my soul will actually have an infinite number and complexity of perceptions. Obviously, however, I do not apperceive - am not conscious of - all these '*little perceptions*'. Perception then does not mean apperception - Leibniz argues that this is a major error on Descartes' part. Leibniz is one of the first philosophers to have analysed the importance of that which is 'unconscious' in our mental lives. Further, where I am conscious of some perception, it will be of a blurred *composite* perception. Leibniz's analogy is of the roar of the waves of the beach - the sound is in fact made up of a vast number of individual sounds of droplets of water smacking into something else. For Leibniz, little perceptions are an important philosophical insight: First and foremost, this relates to one of Leibniz's main general principles, the *principle of continuity*. Nature, Leibniz claims, 'never makes leaps' (*New Essays On Human Understanding*, 56). This follows, Leibniz believes, from the principle of sufficient reason together with the idea of the perfection of the universe consisting of something like plenitude. But the idea of little perceptions allows Leibniz to account for how such continuity actually happens even in everyday circumstances. The principle of continuity is very important for Leibniz's physics (see 'Specimen Dynamicum') - and as we shall see turns up in Leibniz's account of change in the monad.

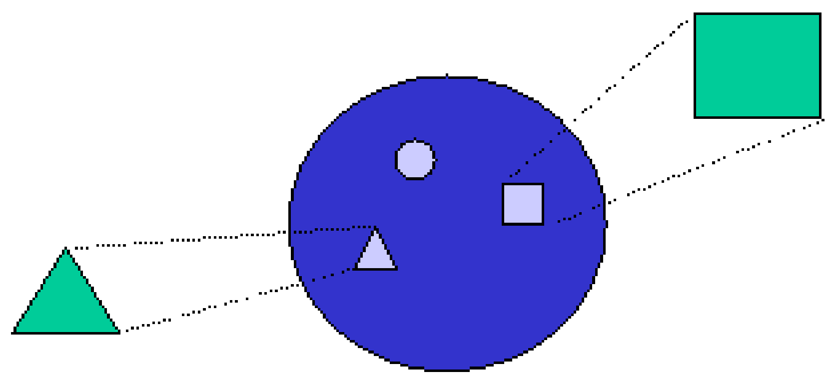
Second, little perceptions explain the acquisition of innumerable minor habits and customs, which make up a huge part of our distinctiveness as individual personalities. Such habits accumulate continuously and gradually, rather than all at once like decisions, and thus completely bypass the conscious will. Further, these little perceptions account for our pre-conscious connection with the world. For Leibniz, our relation with the world is not one just of knowledge, or of apperceived sensation. Our relation with the world is richer than either of these, a kind of background feeling of being-a-part-of - thus a thorough-going scepticism, however plausible at a logical level, is ultimately absurd. Finally, for Leibniz, his idea of little perceptions gives a phenomenal (rather than metaphysical) account for the impossibility of real indiscernibles: there will always be differences in the petite perceptions of otherwise

very similar monads. The differences may not be observable at the moment, but will 'unfold in the fulness of time' into a discernible difference (*New Essays*, 245-6).

III. As we saw above, what we perceive at the phenomenal level as bodies (my body, my coffee cup) are actually composites of monads. Actually, such bodies must be made of an infinite number of other inanimate as well as animated monads. This follows from the universe being the most perfect possible, which as we saw seems to mean the richest in controlled complexity, in 'plenitude'. Leibniz argues that it would be a great waste of possible perfection to only allow living beings to have bodies at that particular level of aggregation with which we are phenomenally familiar. Leibniz was understandably impressed by the different levels of magnitude being revealed by relatively recently invented instruments like the microscope and telescope. Leibniz writes:

> *Every portion of matter can be thought of as a garden full of plants, or as a pond full of fish. But every branch of the plant, every part of the animal, and every drop of its vital fluids, is another such garden, or another such pool.* [...] *Thus there is no uncultivated ground in the universe; nothing barren, nothing dead.* (*Monadology*, §67,69)

(Not for a moment denying the extraordinary sublimity of such an image, but Leibniz is often accused of making rather too much of an inadequate and half-baked conception of the infinite.)



Further, the particular monads making up my body are constantly changing as I breath in and out, shed skin, etc. - although not all at one. The substantial form is thus a unified explanation of bodily form and function. A mere chunk of stuff has, of course, an explanation, but not a unified one - not in one monad, the soul. Leibniz thus posits a four-way division of the types of monads: humans, animals, plants, matter. All have perceptions, in the sense that they have internal properties that 'express' external relations; the first three have substantial forms, and thus appetition; the first two have memory; only the first has reason. (See *Monadology* §18-19,29)

IV. An innate idea is any idea which is intrinsic to the mind rather than arriving in some way from outside it. During this period in philosophy, innate ideas tended to be opposed to the thorough-going empiricism of Locke. Like Descartes before him - and for many of the same reasons - Leibniz found it necessary to posit the existence of innate ideas. Now, at the metaphysical level, since monads have no 'windows', it must be the case that *all* ideas are innate. That is to say, an idea in my monad/ soul is just another property of that monad, which happens according to an entirely internal explanation represented by the complete concept. But at the phenomenal level, it is certainly the case that many ideas are *represented as* arriving through my senses. In general, at least any relation in space or time will appear in this way.

Thus, one could imagine Leibniz being a thorough-going empiricist at the phenomenal level of description. This would amount to the claim that the metaphysically true innateness of all ideas is epistemologically useless information. Leibniz finds it necessary, therefore, to advance the following arguments in favour of phenomenally innate ideas:

(i) Some ideas are characterised by universal necessity. Such as ideas in geometry, logic, metaphysics, morality, and theology. It is impossible to derive universal necessity from experience. (This argument is hardly new to Leibniz!) (ii) An innate idea need not be an idea consciously possessed (because of 'little perceptions' for example). An innate idea can be potential, as an inclination of reason, as a rigid distortion in Locke's *tabula rasa*. (Here, Leibniz provides the famous analogy of the veins in the marble

prior to the sculptor's work.) It requires 'attention' (especially in the form of philosophical thinking) to bring to explicit consciousness the operation, and to clarify the content, of these innate ideas. (iii) The possibility of foreseeing an event that is not similar to (and thus merely an associated repetition of) a past event. By using rational principles of physics, for example, we can analyse a situation and predict the outcome of all the masses and forces - even though we have never experienced a similar situation or outcome. This, Leibniz says, is the privilege of humans over animals ('brutes'), who only have the 'shadow' of reason, because they can only move from one idea to another by association of similars. (See Leibniz's joke about empiricists at *Monadology* §28) Leibniz's most extensive discussion of innate ideas, not surprisingly, is in the *New Essays Concerning Human Understanding*.

Metaphysically, all properties of monads are 'internal' or 'innate' – but many exist as 'expressions' of relations to other monads.

Thus, at the phenomenal level, Leibniz can distinguish between innate and empirical ideas. An empirical idea would be a property of my monad which itself expresses a relation to some other substance, or which arises from another internal property which was the expression of an external substance. Although the difference empirical/innate is in fact an illusion, it does make a difference, for example to the methodology of the sciences. This is similar to the distinction made above between the idea of truth (as the containedness of the predicate in the subject), and the pragmatic/methodological issue of how we come to know that truth. The latter is not irrelevant, except to the foundation and definition of truth.

10. Activity and Time

Correlate to the inter-connectedness of predicates in the complete concept is an *active power* in the monad, which thus always acts out its predicates spontaneously. Predicates are, to use a fascinating metaphor of Leibniz's, 'folded up' within the monad. In later writings such as the 'Monadology', Leibniz describes this using the Aristotelian/Medieval idea of *entelechy*: the becoming actual or achievement of a potential. This word is derived from the idea of perfections. What becomes actual strives to finish or perfect the potential, to realise the complete concept, to unfold itself perfectly as what it is in its

entirety. This active power is the essence of the monad. (Leibniz has several different names for this property (or closely related properties) of monads: entelechy, active power, *conatus* or *nisus* (effort/striving, or urge/desire), primary force, internal principle of change, and even light (in 'On the Principle of Indiscernibles').)

This activity is not just a property of human souls, but of all monads. This inner activity must mean not only being the source of action, but also being affected (passivity), and of resisting (inertia). As we saw above, what we call 'passivity' is just a more complex and subtle form of activity. Both my activity and my resistance, of course, follow from my complete concept, and are expressed in phenomena as causes and as effects. Change in a monad is the intelligible, constantly and continuously (recalling here the principle of continuity discussed above) unfolding being of a thing, from itself, to itself. 'Intelligible' means: (i) according to sufficient reason, not random or chaotic; and (ii) acting as if designed or purposed, as if *alive* - thus Leibniz's contribution to the philosophical tradition of 'vitalism'.

It is important to understand that this is not just a power to act, conceived as separable from the action and its result. Rather, Leibniz insists that we must understand that power together with (i) the sufficient reason of that power; (ii) the determination of the action at a certain time and in a certain way; (iii) together with all the results of the action, first as the merely potential and then as the actual. (See 'On the Principle of Indiscernibles', and *Monadology* §11-15) We are not, therefore, to understand a sequence of states, the individual bits of which are even ideally separable (except as a object of mere description for science), nor a sequence of causes and effects, again understood to be ideally separable (as if you could have had the cause without the effect). All this follows from the complete concept, the predicates of which are connected in one concept. Each 'state' therefore contains the definite trace of all the past, and is (in Leibniz's famous phrase) 'pregnant' with all the future.

But time too is an illusion, just like space. How are we to understand change without time? The important question is: what conception of time are we talking about? Just like space, Leibniz is objecting to any conception of time which is *exterior* to the objects that are normally said to be 'in' time (time as an exterior framework, a dimension). Also, he objects to time as mere chronology, to a conception of time as a sequence of 'now' points that are ideally separable from one another (not essentially continuous), and are countable and orderable separately from any thing being 'in' them (abstract).

However, in discussing relational properties above, and in particular Leibniz's response to the Newton/Clarke argument about non-linear motion, we found that 'space' was in a sense preserved as a set of *rules* about the representative properties of monads. Here, too, but in a more profound way, 'time' is preserved immanently to the monad. The active principle of change we have been discussing above is immanent to monads, and no one state can be separated from all the others - without completely altering the thing in question into a thing that never changes, that has only the one state for all eternity. For Leibniz, the past and future are no more disconnected - in fact less - from the present than 'here' is from 'there'. Both distinctions are illusions - but temporal relations in a substance form an explanatory, intelligible sequence of a self-same thing. The principle of change becomes an original, internal and active power of the thing constantly becoming the thing that it is, as the spontaneous happening and internal principle of the particular order of things which make up that substance. Substances unfold, become the things God always knew them to be, in a time that is *nothing other than* precisely that becoming.

Time, then, has three levels: (i) the atemporality or eternality of God; (ii) the continuous immanent becoming-itself of the monad as *entelechy*; (iii) time as the external framework of a chronology of 'nows'. The difference between (ii) and (iii) was opened up by our account of the internal principle of change. The real difference between the necessary being of God, and the contingent, created finitude of human being, is the difference between a (i) and (ii).

11. Influences.

Leibniz mathematics - in parallel to Newton's - made a real difference to European science in the 18th century. Other than that, however, his contributions as for example engineer or logician were quickly forgotten, and had to be re-invented elsewhere later.

However, Leibniz's metaphysics was highly influential, renewing the Cartesian project of rational metaphysics, and bequeathing a set of problems and approaches that had a huge impact on much of 18th century philosophy. Kant above all would have been unthinkable without Leibniz's philosophy - especially the accounts of space and time, of sufficient reason, of the distinction between phenomenal and metaphysical reality, and his approach to the problem of freedom, not to mention Leibniz's largely welcoming attitude toward British empiricism. Rarely did Kant agree with his great predecessor - indeed, rendering the whole Cartesian/ Leibnizian approach conceptually impossible - but the influence was never the less necessary. After Kant, Leibniz was more often than not a mine of individual fascinating ideas, rather than a systematic philosopher, ideas appearing (in greatly modified forms) in for example Hegelian idealism, romanticism and Bergson.

In the 20th century, Leibniz has been widely studied by Anglo-American 'analytic' philosophy as a great logician who made significant contributions to, for example, the theory of identity and modal logic. In Continental European philosophy, Leibniz has perhaps been less commonly treated as a great predecessor, although fascinating texts by Heidegger and, much later, by Deleuze, show the continuing fertility of his philosophical ideas.

12. Editions of Leibniz

As noted above, Leibniz did not publish much in his lifetime which fits our familiar description of a philosophy book. Much was published, however, shortly after his death. But there remained for the dedication of future editors a huge estate of short papers, letters and drafts of letters, and notes. The standard edition of the works of Leibniz is the Akademie-Verlag of Berlin. The most comprehensive collection of these in English - together with some published material - is to be found in Leibniz. *Philosophical Papers and Letters*. Translated and Edited by Loemker. 2 Volumes. University of Chicago Press, 1956. The text has gone through subsequent editions and is now published (or *should* be) by Kluwer.

There are several good, inexpensive and readily available shorter anthologies of key texts:

- *Philosophical Essays*. Edited and Translated by Ariew and Graber. Hackett, 1989.
- *Philosophical Texts*. Translated by Francks and Woolhouse. Oxford University Press, 1998.
- *Philosophical Writings*. Edited by Parkinson. Translated by Morris and Parkinson. Everyman, 1973.

Finally, there are editions in English of more specialised selections, the longer texts, and correspondences of Leibniz. These include:

- *The Correspondence with Clarke*. Edited by Alexander. Manchester University Press, 1956.
- *The Leibniz-Arnauld Correspondence*. Edited and Translated by Mason. Manchester University Press, 1967.
- *Logical Papers*. Ed. and Trans. Parkinson. Oxford, 1966.
- *The Political Writings of Leibniz*. Ed. and Trans., Riley. Cambridge, 1972.
- *New Essays Concerning Human Understanding*. Edited and Translated by Remnant and Bennett. Cambridge University Press, 1996.
- *Theodicy*. Edited by Farrer. Translated by Huggard. Routledge and Kegan Paul, 1951.

In the above text I have given references as precisely as possible compatible with the reader finding the passages in which soever edition they may be printed. For similar reasons I have tried always to quote and reference to texts available in more than one form in English.

Dr. Douglas Burnham, Staffordshire University

Leucippus (fifth century BCE.)

Leucippus was the founder of Atomism. We know next to nothing about his life, and his book appears to have been incorporated in the collected works of Democritus. No writer subsequent to Theophrastos seems to have been able to distinguish his teaching from that of his more famous disciple. Indeed his very existence has been denied, though on wholly insufficient grounds.

Aristotle gives a clear and intelligible account of the way Leucippus' theory arose. It originated from Parmenides' denial of the void, from which the impossibility of multiplicity and motion had been deduced. Leucippus supposed himself to have discovered a theory which would avoid this consequence. He admitted that there could be no motion if there was no void, and he inferred that it was wrong to identify the void with the non-existent. Leucippus was the first philosopher to affirm, with a full consciousness of what he was doing, the existence of empty space. The Pythagorean void had been more or less identified with 'air', but the void of Leucippus was really a vacuum.

Besides space there was body, and to this Leucippus ascribed all the characteristics of Parmenides notion of the real. The assumption of empty space, however, made it possible to affirm that there was an infinite number of such reals, invisible because of their smallness, but each possessing all the marks of the Parmenidean One, and in particular each indivisible like it. These moved in the empty space, and their combinations can give rise to the things we perceive with the senses. Pluralism was at least stated in a logical and coherent way. Democritus compared the motions of the atoms of the soul to that of the motes in the sunbeam which dart hither and thither in all directions even when there is no wind, and we may fairly assume that he regarded the original motion of the other atoms in much the same way.

The atoms are not mathematically indivisible like the Pythagorean monads, but they are physically indivisible because there is no empty space in them. Theoretically, then, there is no reason why an atom should not be as large as a world. Such an atom would be much the same thing as the Sphere of Parmenides, were it not for the empty space outside it and the plurality of worlds. As a matter of fact, however, all atoms are invisible. That does not mean, of course, that they are all the same size; for there is room for an infinite variety of sizes below the limit of the minimum visible. Leucippus explained the phenomenon of weight from the size of the atoms and their combustions, but he did not regard weight itself as a primary property of bodies. Aristotle distinctly says that none of his predecessors had said anything of absolute weight and lightness, but only of relative weight and lightness, and Epicurus was the first to ascribe weight to atoms. Weight for the earlier atomists is only a secondary phenomenon arising, in a manner to be explained, from excess of magnitude. It will be observed that in this respect the early atomists were far more scientific than Epicurus and even than Aristotle. The conception of absolute weight has no place in science, and it is really one of the most striking illustrations of the true scientific instinct of the Greek philosophers that no one before Aristotle ever made use of it, which Plato expressly rejected it.

The first effect of the motion of the atoms is that the larger atoms are retarded, not because they are 'heavy', but because they are more exposed to impact than the smaller. In particular, atoms of an irregular shape become entangled with one another and form groups of atoms, which are still more exposed to impact and consequent retardation. The smallest and roundest atoms, on the other hand, preserve their original motions best, and these are the atoms of which fire is composed. In an infinite void in which an infinite number of atoms of countless shapes and sizes are constantly impinging upon one another in all directions, there will be an infinite number of places where a vortex motion is set up by their impact. when this happens, we have the beginning of a world. It is not correct to ascribe this to chance, as later writers do. It follows necessarily from the presuppositions of the system. The solitary fragment of Leucippus we possess is to the effect that 'Naught happens for nothing, but all thins from a ground (*logos*) and of necessity'.

Liar Paradox

The Liar Paradox is an argument that arrives at a contradiction by reasoning about a Liar Sentence. The most familiar Liar Sentence is the following self-referential sentence:

> **(1) This sentence is false.**

Experts in the field of philosophical logic have never agreed on the way out of the trouble despite 2,300 years of attention. Here is the trouble--a sketch of the Liar Argument that reveals the contradiction:

> **If (1) is true, then (1) is false. On the other hand, if (1) is false, then it is true to say (1) is false, but because the Liar Sentence is saying precisely that (namely that it is false) (1) is true. So (1) is true if and only if it is false. Since (1) is one or the other, it is both.**

The argument depends upon a few more assumptions and steps, but these are apparently as uncontroversial as those above.

The contradictory result throws us into the lion's den of semantic incoherence. For example, the Liar Sentence can be put to devious uses. In the late medieval period, Buridan did this with the following proof of the existence of God. It uses the pair of sentences:

> **God exists.**
> **None of the sentences in this pair is true.**

The only consistent way to assign truth values, that is, to have these two sentence be either true or false, requires making "God exists" be true. So, Buridan has 'proved' that God does exist.

The Liar Paradox has been discussed continually in philosophy since the middle of the 4th century BCE. The most ancient attribution is to Eubulides of Miletus. He said, "A man says that he is lying. Is what he says true or false?" An ancient gravestone on the Greek Island of Cos was reported by Athenaeus to contain this poem about the paradox:

O Stranger: Philetas of Cos am I,
'Twas the Liar who made me die,
And the bad nights caused thereby.

Theophrastus, Aristotle's successor, wrote three papyrus rolls about the Liar Paradox, and the Stoic philosopher Chrysippus wrote six, but their contents are lost in the sands of time. In the New Testament of the Bible, Saint Paul warned, "One of themselves, even a prophet of their own, said the Cretans are always liars." Paul, however, gave no indication he recognized anything paradoxical about the Cretan's remark.

There are many versions of the Paradox in addition to Buridan's and the Liar generated from (1).

Some liar paradoxes begin with sets of two or more sentences:

> **The following sentence is true.**
> **The previous sentence is false.**

The Strengthened Liar Paradox begins with the Strengthened Liar Sentence

> **This sentence is not true.**

This version is called "Strengthened" because it does not use the concept of falsehood and because some promising solutions to (1) fail completely when faced with the Strengthened Liar. So, finding one's way out of the Strengthened Liar is the acid test of a successful solution. There are also Contingent Liars which depend upon what occurs in the empirical world. Suppose that the last sentence in today's edition of *The New York Times* newspaper is:

> **The last sentence in tomorrow's edition of *The New York Times* newspaper is true.**

Was that sentence grammatical? Was it meaningful? Was it true or false, even if we don't know which at the moment? The common sense answers are "yes" to all these questions. Perhaps we should not retain those intuitive answers tomorrow when the *Times*'s presses print a newspaper whose last sentence is

> **The last sentence in yesterday's edition of *The New York Times* newspaper is not true.**

If we adopt the metaphor of a paradox as being an argument which starts from the home of seemingly true assumptions and which travels down the garden path of seemingly valid steps into the den of a contradiction, then a solution to the paradox has to find something wrong with the home, find something wrong with the garden path, or find a way to live within the den. Less metaphorically, the main kinds of ways out of the Paradox are the following: Forget it; we can live with the problem. The Liar Sentence isn't grammatical. The Liar Sentence isn't meaningful. The Liar Sentence is grammatical and meaningful but isn't true or false. There is some other error in one of the steps of the argument that leads to the contradiction. The Liar Sentence is both true and false. Two philosophers might take one of these ways out but for very different reasons, and they might offer different changes in our naive system of beliefs and concepts in order to take this way out.

To put the Paradox in perspective, it is essential to appreciate why such an apparently trivial problem in fact is a deep problem. Suppose we ask the larger question: What is truth? As a question about what are the significant paths of life to be followed or the significant things to know in order to have the best grasp on reality, the question is just too difficult, and also too vague, to be a center of attention for the analytical philosophers of the present age. However, as a question asking simply for general characteristics of all true sentences, the question is more amenable to solution. Nevertheless, it is still a very difficult one. For instance, in the attempt to generally characterize the grounds of validity of a true sentence, that is, in the attempt to characterize *why* a true sentence is true, philosophers have created several ingenious, and alluring theories: the correspondence theory of truth, the coherence theory of truth, and the pragmatic theory of truth, among others. Yet none of these has produced any detailed theory. At best, each is still at the stage of being a suggestive, but uncompelling, metaphor.

More progress on answering the question "What is truth?" will be had by concentrating not on why a sentence is true, but on what other sentences are true when a sentence is true. By

concentrating this way on truth's logical liaisons, Aristotle offered what many philosophers consider to be a partially correct answer to our question about truth. Stripped of its overtones suggesting a correspondence theory of truth, Aristotle proposed what is essentially sentence (T):

> **(T) A declarative sentence is true if and only if what it says is so.**

If pairs of quotation marks serve to name a sentence, then (T) requires that "It is snowing" be true just in case it is snowing. Similarly, if the sentence about snow were named with the number 88 inside a pair of parentheses, then (88) would be true just in case it is snowing. What could be less controversial? Unfortunately, this seemingly correct, but trivial response to our question is neither obviously correct nor trivial; and the resolution of the difficulty is still an open problem in philosophical logic. Why is that? The brief answer is that it leads to the Liar Paradox. The longer answer refers to Tarski's Undefinability Theorem of 1936.

We began this discussion with a mere sketch of the Liar argument using sentence (1). To provide the details, we need (T) plus the following assumptions that also are apparently acceptable:

> **(2) Any declarative sentence "S" says that S.**
>
> **(3) The Liar Sentence, (1), is a legitimate declarative sentence.**
>
> **(4) A declarative sentence is either true or else false.**
>
> **(5) The usual naming convention holds so that**
>
> > **the phrase "This sentence" in (1) refers to (1), and**
> >
> > **(1) = "This sentence is false".**

Tarski added precision to convention (T) and these other assumptions by focussing not on English directly but on a classical formal language capable of expressing arithmetic. Here the difficulties became much clearer; and, very surprisingly, he was able to prove that the assumptions lead to semantic incoherence. Tarski pointed out that the crucial assumption is (3). For there to be a legitimate Liar Sentence in the language, there must be a definable notion of "is true" which holds for the true sentences and fails to hold for the other sentences. If there were such a 'global truth predicate,' then the predicate "is a false sentence" would also be definable and [here is where we need the power of arithmetic] a Liar Sentence would exist. But if so, then from (T), (2), (3), (4) and (5) [but not (1) because the Liar Sentence is not an assumption in the Liar Argument], one could deduce a contradiction. Tarski's deduction is a formal analog of the Liar Argument. The contradictory result tells us that the argument began with a false assumption. Because (T), (2), (4), and (5) are essential to what we call a "classical formal language," the mistaken assumption is (3), and the only possible problem here is the assumption that the global truth predicate "is a true sentence" can be defined. So, Tarski has proved that truth is not definable in a classical language--thus the name "Undefinability Theorem." Tarski's theorem establishes that classically interpreted languages capable of expressing arithmetic cannot contain a global truth predicate. A language containing its own global truth predicate is said to be semantically closed. Tarski's Theorem implies that classical formal languages with the power to express arithmetic cannot be semantically closed. This suggests that English itself may not be semantically closed, or, if English *is* closed, then it is self-contradictory. This shocking result indicates to some that our thought about our thoughts is incoherent. That's the conclusion Tarski himself reached, so he quit trying to find

the coherent structure underlying natural languages and concentrated on developing systems of formal languages that did not allow the deduction of the contradiction. Most other philosophers of logic have not drawn Tarski's pessimiistic conclusion.

For these optimists, there are four main detailed and coherent ways out.

> **(1) The Liar Sentence is meaningless, so the Liar argument can't even get started because its main assumption (that the Liar Sentence exists or is meaningful) is faulty. Natural language is incoherent, and its underlying sensible structure is that of an infinite hierarchy of levels. Because the Liar Sentence would have to reside on more than one level simultaneously, it's not really a meaningful sentence. This way out of the paradox is taken by Russell in his ramified theory of types and, following Tarski, by Quine in his hierarchy of meta-languages. For Russell, the referential phrase "This sentence" in (1) is the culprit because the phrase is not allowed to refer to the sentence in which the phrase itself occurs. For Quine, instead, the culprit is the phrase "is false" in (1) because the phrase must be satisfied by sentences in a language lower in the hierarchy and not by the very sentence in which the phrase occurs.**
>
> **(2) Kripke, on the other hand, *retains* the intuition that the Liar Sentence is meaningful, but argues that it is neither true nor false. It lacks a truth value as does the odd sentence "The present king of France is bald." He rejects the infinite hierarchy of meta-languages underlying English in favor of one formal object language having a hierarchy of partial interpretations, one of which (his lowest fixed-point) assigns an interpretation to all the basic (atomic) predicates of the language except for the truth predicate. The truth predicate is the only partial predicate, and the formal analog of the Liar Sentence is assigned neither the value True nor the value False in the fixed point. Under the fixed point interpretation of the formal language that is the coherent structure within English, the language satisfies Tarski's Convention (T); both S and "S"-is-true have the same truth conditions for any sentence S.**
>
> **(3) The third way out says the Liar Sentence is meaningful and is true or else false, but one step of the argument in the Liar Paradox is incorrect (the move from the falsehood of the Liar Sentence to its truth). Prior, following the informal suggestions of Buridan and Peirce, takes this way out and concludes that the Liar Sentence is simply false.**
>
> **(4) A fourth and more radical way out of the paradox is to argue that semantic incoherence is not necessarily caused by letting the Liar Sentence be both true and false. This solution embraces the contradiction, then tries to limit the damage that is ordinarily a consequence of that embrace. This way out of the paradox uses a paraconsistent logic.**

Although there are many suggestions for how to deal with the Liar Paradox, most are never developed to the point of giving a formal, symbolic theory. Some give philosophical arguments for why this or that conceptual reform is plausible as a way out of paradox, but then don't show that their ideas can be carried through in a rigorous way. Usually it appears that a formal treatment won't be successful. Some other solutions require changes in formalisms so that one or another formal analog of the Liar Paradox's argument fails, but then they give no philosophical argument to back up their formal changes. A decent theory of truth showing the way out of the Liar Paradox

requires both a coherent formalism (or at least a systematic theory of some sort) and a philosophical justification backing it up. The point of the philosophical justification is an unveiling of some hitherto unnoticed or unaccepted rule of language for all sentences of some category which has been violated by the argument of the paradox. It is to the credit of Russell, Quine, and Kripke that they provide a philosophical justification for their solutions while also providing a formal treatment in symbolic logic that shows in detail both the character and implications of their proposed solution. Kripke's elegant and careful treatment of (1) stumbles on the Strengthened Liar and reveals why it deserves its name. The theories of Russell-Tarski-Quine do 'solve' the Strengthened Liar. In the formal, symbolic tradition, other important researchers in the last quarter of the 20th century are Barwise, Burge, Etchemendy, Gupta, Herzberger, McGee, Routley, Skyrms, van Fraassen, and Yablo. Martin and Woodruff created the same solution as Kripke, though a few months earlier. Dowden and Priest first showed how to embrace contradiction.

Principal solutions to the Liar Paradox all have a common approach, the "systematic approach." The solutions agree that the Liar Paradox represents a serious challenge to our understanding the logic of natural language, and they agree that we must go back and *systematically* reform or clarify some of our original beliefs in order to solve the paradox. The solution must be presented systematically and be backed up by an argument about the general character of our language. In short, there must be both systematic evasion and systematic explanation. Also, when it comes to developing this systematic approach, the goal of establishing a logical basis for a consistent semantics of natural language is much more important than the goal of explaining the naive way most speakers use the terms "true" and "not true." As Vann McGee expresses this point, "The problem of giving voice to our preanalytic intuitions about truth is comparatively less important, just as understanding popular misconceptions about space and time is comparatively less important than understanding the actual geometry of space-time."

This 'systematic approach' has been seriously challenged by Wittgenstein. He says one should try to overcome ''the superstitious fear and dread of mathematicians in the face of a contradiction." The proper way to respond to any paradox is by an ad hoc reaction and not by any systematic treatment designed to cure both it plus any future ills. Symptomatic relief is sufficient. It may appear legitimate, at first, to admit that the Liar Sentence is meaningful and also that it is true or false, but the Liar Paradox shows that one should retract this admission and either just not use the Liar Sentence in any arguments, or say it is not really a sentence, or at least say it is not one that is either true or false. Wittgenstein is not particularly concerned with which choice is made. And, whichever choice is made, it needn't be backed up by any theory that shows how to systematically incorporate the choice. He treats the whole situation cavalierly and unsystematically. After all, he says, the language can't really *be* incoherent because we've been successfully using it all along, so why all this "fear and dread"?

P. F. Strawson has argued that the proper way out of the Liar Paradox is to re-examine how the term "truth" is really used by speakers. When we say some proposition is true, we aren't making a statement about the proposition. We are not ascribing a property to the proposition--such as the property of correspondence, or coherence, or usefulness. When we call a proposition "true" we are approving it, or praising it, or admitting it, or condoning it. We are performing an action. Similarly, when we say to our sister, "I promise to pay you fifty dollars," we aren't ascribing some property to the proposition, "I pay you fifty dollars." Rather, we are performing the act of promising. For Strawson, when speakers utter the Liar Sentence, they are attempting to praise

something that isn't there, as if they were saying "Ditto" when no one has spoken. The person who utters the Liar Sentence is making a pointless utterance. The Sentence is grammatical but it's not a proposition and so is not something from which a contradiction can be derived.

The most serious challenges to Strawson's solution have attempted to show that this general analysis of truth is incorrect. If we say, "I hope what she will say is true," I am not performing the act of praising what she says; I don't even know what she will say.

Some of the solutions to the Liar Paradox require a revision in classical logic, the formal logic in which sentences of a formal language have exactly two possible truth values (TRUE, FALSE), and in which the usual rules of inference allow one to deduce anything from an inconsistent set of assumptions. Kripke's revision uses a 3-valued logic with the truth values TRUE, FALSE and NEITHER. Some logicians argue that classical logic is not the incumbent which must remain in office unless an opponent can dislodge it, although this is gospel for other philosophers of logic (probably because of the remarkable success of two-valued logic in expressing most of modern mathematical inference). Instead, the office has always been vacant for natural language.

Other philosophers object to revising classical logic merely to find a way out of the Paradox. They say that philosophers shouldn't build their theories by attending to the queer cases. There are more pressing problems in the philosophy of logic and language than finding a solution to the Paradox, so any treatment of it should wait until these problems have a solution. From the future resulting theory which solves those problems, one could hope to deduce a solution to the Liar Paradox. However, for those who believe the Paradox is not a minor problem but one deserving of immediate attention, there can be no waiting around until the other problems of language are solved independently. Perhaps the investigation of the Liar Paradox will even affect the solutions to these other problems.

Bibliography

For an essay on the Liar Paradox that provides more of an introduction to the area while not presupposing a strong background in symbolic logic, the author recommends the article below by Benson Mates, the first chapter of the Barwise-Etchemendy book, and then chapter 9 of the Kirkham book. The rest of this bibliography is a list of contributions to research on the Liar Paradox, and nearly all items require the reader to have significant familiarity with the techniques of symbolic logic.

Ancient Greek and Roman Libraries

ANCIENT GREEK LIBRARIES. The large libraries of the Assyrian and Egyptian monarchs were unknown to the Greeks till the time of the Ptolemies. We do indeed hear of a library formed by Pisistratus, which Aulus Gellius calls "the first public library"; of another by Polycrates, the tyrant of Samos; and among private collectors we hear of Nicocrates of Cyprus, Euclid the Archon, Euripides, Euthydemus, and Aristotle. But it was the Meacedonian rulers of Alexandria who first created a public library on a large scale. Ptolemy Philadelphus collected books from all parts of Greece and Asia, the large number of which he deposited in the Museum, a building in the Bruchium quarter of Alexandria, and the rest in the Serapeum. Zenodotus was the first librarian, after him Callimachus (who made a catalog called the *Pinakes*, then Eratosthenes, then Apollonius, and then Aristophanes. the number of volumes in the two libraries seems to have been between 500,000 and 600,000. Books in foreign languages were brought to Alexandria and translated for the purpose of being placed in the library, and the Septuagint version of the Old Testament is said to have been made in this way. Galen tells us that the autograph original copies of Aeschylus, Sophocles, and Euripides were procured for the library. This priceless collection suffered considerably in the siege of Alexandria by Julius Caesar, in the destruction of the Bruchium quarter by Aurelian (273 CE.), and by the edict of Theodosius for the destruction of the Serapeum (389 CE.), until it was finally destroyed by the Arabs (640 CE.). A rival library to that at Alexandria was started by the kings of Pergamus, but was transported to Egypt by Antony, who made a present of its 200,000 volumes to Cleopatra. By the second or first century B.C. there seem to have been libraries in most Greek towns.

ANCIENT ROMAN LIBRARIES. The first public library in Rome was that founded by Asinius Pollio, and was in the Atrium Libertatis on the Aventine. Julius Caesar had projected a grand Greek and Latin library, and had commissioned Varro to take measures for the establishment of it; but the scheme was prevented by his death. The library of Pollio was followed by that of Augustus in the Temple of Apollo on the Palatine Hill, another, the Bibliotheca Octaviana (so called from Augustus's sister Octavia), forming part of the Porticus Octavia. There were also libraries on the Capitol, in the Temple of Peace founded by Vespasian, in the palace of Tiberius, besides the Ulpian Library (so called after its founder, Trajan), which was the most famous. This library was attached by Diocletian, as an ornament, to his *thermae*. Private collections of books were made at Rome soon after the Second Punic War, sometimes from the spoils of Grecian or Eastern conquest. Thus Aemilius Paulus brought to Rome the library of Perseus, king of Macedonia; Sulla, that of Apellicon of Teos; Lucullus, the extensive one of the kings of Pontus, to which he gave the public free access. The zeal of Cicero, Atticus, Varro, and others in increasing their libraries is well known. Serenus Sammonicus possessed a library of 62,000 books.

Towards the end of the Republic it became, in fact, the fashion to have a room elegantly furnished as a library, and reserved for that purpose. However ignorant or unstudious a person might be, it was fashionable to appear learned by having a library, though he might never even read the titles

of the books. Seneca condemns the rage for mere book-collecting, and rallies those who were more pleased with the outside than the inside. Lucian wrote a separate piece to expose this common folly. We read of provincial libraries at Milan, Comum, Tibur, and Patrae. A library generally had an eastern aspect. In Herculaneum a library, fully furnished, has been discovered. Round the walls, it had cases containing the books in rolls, and a rectangular case occupied the center of the room: these cases were numbered. It was a very small room -- so small that a person by stretching out his arms could touch both sides of it; yet it contained 1700 rolls. The cases were called either *armaria, loculamenta, foruli,*or *nidi*. Asinius Pollio had set the fashion in his public library of adorning the room with the portraits and busts of celebrated men, as well as statues o Minerva and the Muses. This example was soon followed in the private libraries of the rich. The *librarii a bibliotheca* or *bibliothecarii*, who had charge of the libraries, were usually slaves or freedmen.

John Locke (1632-1704)

Life. John Locke was born at Wrington, a village in Somerset, on August 29, 1632. He was the son of a country solicitor and small landowner who, when the civil war broke out, served as a captain of horse in the parliamentary army. "I no sooner perceived myself in the world than I found myself in a storm," he wrote long afterwards, during the lull in the storm which followed the king's return. But political unrest does not seem to have seriously disturbed the course of his education. He entered Westminster school in 1646, and passed to Christ Church, Oxford, as a junior student, in 1652; and he had a home there (though absent from it for long periods) for more than thirty years -- till deprived of his studentship by royal mandate in 1684. The official studies of the university were uncongenial to him; he would have preferred to have learned philosophy from Descartes instead of from Aristotle; but evidently he satisfied the authorities, for he was elected to a senior studentship in 1659, and, in the three or four years following, he took part in the tutorial work of the college. At one time he seems to have thought of the clerical profession as a possible career; but he declined an offer of preferment in 1666, and in the same year obtained a dispensation which enabled him to hold his studentship without taking orders. About the same time we hear of his interest in experimental science, and he was elected a fellow of the Royal Society in 1668. Little is known of his early medical studies. He cannot have followed the regular course, for he was unable to obtain the degree of doctor of medicine. It was not till 1674 that he graduated as bachelor of medicine. In the following January his position in Christ Church was regularized by his appointment to one of the two medical studentships of the college.

His knowledge of medicine and occasional practice of the art led, in 1666, to an acquaintance with Lord Ashley (afterwards, from 1672, Earl of Shaftesbury). The acquaintance, begun accidentally, had an immediate effect on Locke's career. Without serving his connection with Oxford, he became a member of Shaftesbury's household, and seems soon to have been looked upon as indispensable in all matters domestic and political. He saved the statesman's life by a skillful operation, arranged a suitable marriage for his heir, attended the lady in her confinement, and directed the nursing and education of her son -- afterwards famous as the author of *Characteristics*. He assisted Shaftesbury also in public business, commercial and political, and followed him into the government service. When Shaftesbury was made lord chancellor in 1672, Locke became his secretary for presentations to benefices, and, in the following year, was made secretary to the board of trade. In 1675 his official life came to an end for the time with the fall of his chief.

Locke's health, always delicate, suffered from the London climate. When released from the cares of office, he left England in search of health. Ten years earlier he had his first experience of foreign travel and of public employment, as secretary to Sir Walter Vane, ambassador to the Elector of Brandenburg during the first Dutch war. On his return to England, early in 1666, he declined an offer of further service in Spain, and settled again in Oxford, but was soon induced by Shaftesbury to spend a great part of his time in London. On his release from office in 1675 he sought milder air in the south of France, made leisurely journeys, and settled down for many months at Montpellier. The journal which he kept at this period is full of minute descriptions of places and customs and

institutions. It contains also a record of many of the reflections that afterwards took shape in the *Essay concerning Human Understanding*. he returned to England in 1679, when his patron had again a short spell of office. He does not seem to have been concerned in Shaftesbury's later schemes; but suspicion naturally fell upon him, and he found it prudent to take refuge in Holland. This he did in August 1683, less than a year after the flight and death of Shaftesbury. Even in Holland for some time he was not safe from danger of arrest at the instance of the English government; he moved from town to town, lived under an assumed name, and visited his friends by stealth. His residence in Holland brought political occupations with it, among the men who were preparing the English revolution. it had at least equal value in the leisure which it gave him for literary work and in the friendships which it offered. In particular, he formed a close intimacy with Philip van Limbroch, the leader of the Remonstrant clergy, and the scholar and liberal theologian to whom *Epistola de Tolerantia* was dedicated. This letter was completed in 1685, though not published at the time; and, before he left for England, in February 1689, the *Essay concerning Human Understanding* seems to have attained its final form, and an abstract of it was published in Leclerc's *Bibliotheque universelle* in 1688.

The new government recognized his services to the cause of freedom by the offer of the post of ambassador either at Berlin or at Vienna. But Locke was no place hunter; he was solicitous also on account of his health; his earlier experience of Germany led him to fear the "cold air" and "warm drinking"; and the high office was declined. But he served less important offices at home. He was made commissioner of appeals in May 1689, and, from 1696 to 1700, he was a commissioner of trade and plantations at a salary of L1000 a year. Although official duties called him to town for protracted periods, he was able to fix his residence in the country. In 1691 he was persuaded to make his permanent home at Oates in Essex, in the house of Francis and Lady Masham. Lady Masham was a daughter of Cudworth, the Cambridge Platonist; Lock had manifested a growing sympathy with his type of liberal theology; intellectual affinity increased his friendship with the family at Oates; and he continued to live with them till his death on October 28, 1704.

Writings. **With the exception of the abstract of the *Essay* and other less important contributions to the *Bibliotheque universelle*, Locke had not published anything before his return to England in 1689; and by this time he was in his fifty-seventh year. But many years of reflection and preparation made him ready at that time to publish books in rapid succession. In March 1689 his *Epistola de Tolerantia* was published in Holland; an English translation of the same, by William Popple, appeared later in the same year, and in a corrected edition in 1690. The controversy which followed this work led, on Locke's part, to the publication of a *Second Letter* (1690), and then a *Third Letter* (1692). In February 1690 the book entitled *Two Treatises of Government* was published, and in March of the same year appeared the long expected *Essay concerning Human Understanding*, on which he had been at work intermittently since 1671. it met with immediate success, and led to a voluminous literature of attack and reply; young fellows of colleges tried to introduce it at the universities, and heads of houses sat in conclave to devise means for its suppression. To one of his critics Locke replied at length. This was Edward Stillingfleet, bishop of Worcester, who, in his *Vindication of the Doctrine of the Trinity* (1696), had attacked the new philosophy. It was the theological consequences which were drawn from the doctrines of the *Essay*, not so much by Locke himself as by Toland, in his *Christianity not Mysterious*, that the bishop had chiefly in view; in philosophy for its own sake he does not seem to have been interested. But his criticism drew attention to one of the least satisfactory (if also one of the most suggestive) doctrines**

of the *Essay* -- its explanation of the idea of substance; and discredit was thrown on the "new way of ideas" in general. In January 1697 Locke replied in *A Letter to the Bishop of Worcester*. Stillingfleet answered this in May; and Locke was ready with a second letter in August. Stillingfleet replied in 1698, and Locke's lengthy third letter appeared in 1699. The bishop's death, later in the same year, put an end to the controversy. The second edition of the *Essay* was published in 1694, the third in 1695, and the fourth in 1700. The second and fourth editions contained important additions. An abridgement of it appeared in 1696, by John Wynne, fellow of Jesus College, Oxford; it was translated into Latin and into French soon after the appearance of the fourth edition. The later editions contain many modifications due to the author's correspondence with William Molyneux, of Trinity College, Dublin, a devoted disciple, for whom Locke had a worm friendship. Other correspondents and visitors to Oates during these years were Isaac Newton and Anthony Collins, a young squire of the neighborhood, who afterwards made his mark in the intellectual controversies of the time.

Other interests also occupied Locke during the years following the publication of his great work. The financial difficulties of the new government led in 1691 to his publication of *Some Considerations of the Consequences of Lowering of Interest, and Raising the Value of Money*, and of *Further Considerations* on the latter question, four years later. In 1693 he published *Some Thoughts concerning Education*, a work founded on letters written to a friend, and in 1695 appeared *The Reasonableness of Christianity*, and later *A Vindication* of the same against certain objections; and this was followed by a second vindication two years afterwards. Locke's religious interest had always been strongly marked, and, in he later years of his life, much of his tie was given to theology. Among the writings of his which were published after his death are commentaries on the Pauline epistles, and a *Discourse on Miracles*, as well as a fragment of a *Fourth Letter for Toleration*. The posthumously published writings include further *An Examination of Father Malebranche's Opinion of Seeing all things in God, Remarks on Some of Mr Norris's Books*, and -- most important of all -- the small treatise on *The Conduct of the Understanding* which had been originally designed as a chapter of the *Essay*.

Plan of the *Essay*. **Locke's greatest philosophical contribution is his *Essay*, and we have his own account of the origin of that work. In the winter of 1670, five or six friends were conversing in his room, probably in London. The topic was the "principles of morality and revealed religion," but difficulties arose and no progress was made. Then, he goes on to say, "it came into my thoughts that we took a wrong course, and that before we set ourselves upon inquiries of that nature, it was necessary to examine our own abilities, and see what objects our understandings were, or were not, fitted to deal with." At the request of his friends, Locke agreed to set down his thoughts on this question at their next meeting, and he expected that a single sheet of paper would suffice for the purpose. Little did he realize the magnitude of the issue which he raised, and that it would occupy his leisure for nearly twenty years.**

Locke's interest centers on traditional philosophical topics: the nature of the self, the world, God, and the grounds of our knowledge of them. We reach these questions only in the fourth and last book of the *Essay*. The first three books are preliminary, though they have, and Locke saw that they had, an importance of their own. His introductory sentence makes this plain:

> **Since it is the understanding that sets man above the rest of sensible beings, and gives him all the advantage and dominion which he has over them; it is certainly a subject, even for its nobleness, worth our labour to inquire into. The understanding, like the**

> eye, while it makes us see and perceive all other things, takes no notice of itself; and it requires art and pains to set it at a distance and make it its own object. But whatever be the difficulties that lie in the way of this inquiry; whatever it be that keeps us so much in the dark to ourselves; sure I am that all the light we can let in upon our minds, all the acquaintance we can make with our own understandings, will not only be very pleasant, but bring us great advantage, in directing our thoughts in the search of other things.

Locke will not "meddle with the physical consideration of the mind"; he has no theory about its essence or its relation to the body; at the same time, he has no doubt that, if due pains be taken, the understanding can be studied like anything else: we can observe its object and the ways in which it operates upon them. The *Essay* is divided into four books; the first is a polemic against the doctrine of innate principles and ideas. The second deals with ideas, the third with words, and the fourth with knowledge.

Ideas in General. All the objects of the understanding are described as *ideas*, and ideas are spoken of as being in the mind (Intro. 2; Bk. 2:1:5; Bk. 2:8:8). Locke's first problem, therefore, is to trace the origin and history of ideas, and the ways in which the understanding operates upon them, in order that he may be able to see what knowledge is and how far it reaches. This wide use of the term "idea" is inherited from Descartes. The contemporary term which corresponds with it most nearly is "presentation". But presentation is, strictly, only one variety of Locke's idea, which includes also representation and image, perception, and concept or notion. His usage of the term thus differs so widely from the old Platonic meaning that the danger of confusion between them is not great. It suited the author's purpose also from being a familiar word in ordinary discourse as well as in the language of philosophers. Herein, however, lays danger from which he did not escape. In common usage "idea" carries with it a suggestion of contrast with reality; this is not supposed in Locke's use.

In the first book of the *Essay*, on the subject of innate ideas, Locke points to the variety of human experience, and to the difficulty of forming general and abstract ideas, and he ridicules the view that any such ideas can be antecedent to experience. All the parts of our knowledge, he insists, have the same rank and the same history regarding their origin in experience. It is in its most extreme form that the doctrine of innate ideas is attacked; but he cannot seen any middle ground between that extreme doctrine and his own view that all ideas have their origin in experience. Indeed, it is difficult to determine against whom the argument is directed. But when we note Locke's polemical interest in the question, and remember the significance for him of the empirical origin of all the elements of human knowledge, we can be content to see in it an earnest protest against the principle of authority, a vindication of our right to examine critically all the so-called "principles" of human knowledge.

Locke wishes to avoid any presupposition about matter, or mind, or their relation. It is not difficult to see that the notions which he has expelled often re-enter. But the peculiar value of his approach consists in his attempt to keep clear of them. He begins neither with ind nor matter, but with ideas. Their existence needs no proof: "everyone is conscious of them in himself, and men's words and actions will satisfy him that they are in others." His first inquiry is "how they come into the mind"; has next business is to show that they constitute the whole material of our knowledge. In his answer to the former question we discover the influence of traditional philosophy, or rather of ordinary common sense views of existence, upon his views. All our ideas, he says, come from experience. The

mind has no innate ideas, but it has innate faculties: it perceives, remembers, and combines the ideas that come to it from without; it also desires, deliberates, and wills; and these mental activities are themselves the source of a new class of ideas. Experience is therefore twofold. Our observation may be employed either about external sensible objects, or about the internal operations of our minds. The former is the source of most of the ideas which we have, and, as it depends "wholly upon our senses," is called "sensation." The latter is a source of ideas which "every man has wholly in himself," and it might be called "*internal* sense"; to it he gives the name "reflection."

Simple and Complex Ideas. **There are no innate ideas "stamped upon the mind" from birth; and yet impressions of sense are not the only source of knowledge: "The mind furnishes the understanding with ideas" (Bk. 2:1:5). No distinction is implied here between "mind" and "understanding", so that the sentence might run, "the mind furnishes itself with ideas." As to what these ideas are, we are not left in doubt: they are "ideas of its own operations." When the mind acts, it has an idea of its action, that is, it is self-conscious, and, as such, is assumed to be an original source of our knowledge. Hume and Condilac both refused to admit reflection as an original source of ideas, and both, accordingly, found that they had to face the problem of tracing the growth of self-consciousness out of a succession of sensations. According to Locke, reflection is an original, rather than an independent, source of ideas. Without sensation mind would have nothing to operate upon, and therefore could have no ideas of its operations. It is "when he first has any sensation" that "a man begins to have any ideas" (Bk. 2:1:23). The operations of the mind are not themselves produced by sensation, but sensation is required to give the mind material for working on.**

The ideas which sensation gives "enter by the senses simple and unmixed" (Bk. 2:2:1); they stand in need of the activity of mind to bind them into the complex unities required for knowledge. The complex ideas of substance, modes, and relations are all the product of the combining and abstracting activity of mind operating upon simple ideas, which have been given, without any connection, by sensation or reflection. Locke's account of knowledge thus has two sides. On the one side, all the material of knowledge is traced to the simple idea. On the other side, the processes which transform this crude material into knowledge are activities of mind which themselves cannot be reduced to ideas. Locke's metaphors of the *tabula rasa*, "white paper" (Bk. 2:2:1), and "dark room" misled his critics and suggested to some of his followers a theory very different from his own. The metaphors only illustrate what he had in hand at the moment. Without experience, no characters are written on the "tablets" of the mind; except through the "windows" of sensation and reflection, no light enters the understanding. No ideas are innate; and there is no source of new simple ideas other than those two. But knowledge involves relations, and relations are the work of the mind; it requires complex ideas, and complex ideas are mental formations. Simple ideas do not, of themselves, enter into relation and form complex ideas. Locke does not, like Hobbes before him and Hume and Condillac after him, look to some unexplained natural attraction of idea for idea as bringing about these formations. Indeed, his treatment of "the association of ideas" is an afterthought, and did not appear in the earlier editions of the *Essay*.

Starting from the simple ideas which we get from sensation, or from observing mental operations as they take place, Locke has two things to explain: the universal element, that is, the general conceptions with which knowledge is concerned or which it implies; and the reference to reality which it claims. With the former problem Locke deals at great length; and the general method of his exposition is clear enough. Complex ideas arise from simple ideas by the processes of

combination and abstraction carried out by the mind. It would be unfair to expect completeness from his enterprise: but it cannot be denied that his intricate and subtle discussions left many problems unsolved. Indeed, this is one of his great merits. He raised questions in such a way as to provoke further enquiry. Principles such as the causal relation, apart from which knowledge of nature would be impossible, are quietly taken for granted, often without any enquiry into the grounds for assuming them. Further, the difficulty of accounting for universals is unduly simplified by describing certain products as simple ideas, although thought has obviously been at work upon them.

In this connection an important inconsistency becomes apparent in his account of the primary data of experience. It is, indeed, impossible even to name the mere particular -- the "this, here, and now" of sense -- without giving it a flavor of generality. But, at the outset, Locke tries to get as near it as possible. Simple ideas (of sensation) are exemplified by yellow, white, heat, cold, soft, hard, and so forth (Bk. 2:1:3). But, towards the end of the second book (Bk. 2:21:75), a very different list is given: extension, solidity, and mobility (from sensation); perceptivity and motivity (from reflection); and existence, duration, and number (from both sensation and reflection). These are said to be "our original ideas," and the rest to be "derived" form or to "depend" on them. It is difficult to compare the two lists, instance by instance; but one example may be taken. According to the first list, *hard* is a simple idea; according to the second list, *solidity* is the original (and therefore simple) idea, and *hard* will be derived from it and depend on it. It is clear that, in making the former list, Lock was trying to get back to the primary data of our individual experience; whereas, in the second list, he is rather thinking of the objective reality on which our experience depends and which, he assumes, it reveals. But he does not observe the difference. He seems to forget his view that the original of all knowledge is to be found in the particular, in something "simple and unmixed." Thus he says without hesitation, "If any one asks me, *what this solidity is*, I send him to the senses to inform him. Let him put a flint of a football between his hands, and then endeavour to join them, and he will know" (Bk. 2:4:4). But he will not know without going a long way beyond the simple idea. The simple ideas in the case are certain muscular and tactual sensations; and he interprets these by other means (including knowledge of external objects and his own organism) when he says that the flint or the football is solid.

His doctrine of modes is also affected by this same inattention of the fact that a simple idea must be really simple. Thus he holds that "space and extension" is a simple idea given both by sight and by touch (Bk. 2:4). One would expect, therefore, that the original and simple idea of space would be the particular patch seen at any moment or the particular "feel" of the exploring limb. But we are told that "each idea of any different distance, or space, is a simple mode" or the idea of space (Bk. 2:8:4). Here again the simple idea is generalized. He professes to begin with the mere particulars of external and internal sense, and to show how knowledge -- which is necessarily general -- is evolved from them. But, in doing so, he assumes a general or universal element as already given in the simple idea.

Having gone so far, he might almost have been expected to take a further step and treat the perceptions of particular things as modes of the simple idea *substance*. But this he does not do. Substance is an idea regarding which he was in earnest with his own fundamental theory (however, he was perplexed about the origin of the idea of "substance in general" as well as of the ideas of "particular sorts of substances; Bk. 2:23:2-3). He admits that substance is a complex idea; that is to say, it is formed by the mind's action out of simple ideas. Now, this idea of substance marks the difference between having sensations and perceiving things. Its importance, therefore, is clear; but

there is no clearness in explaining it. We are told that there is a "supposed or confused idea of substance" to which are joined, for example, "the simple idea of a dull whitish colour, with certain degrees of weight, hardness, ductility and fusibility," and, as a result, "we have the idea of *lead*."

A difficulty might have been avoided if substance could have been interpreted as simply the combination by the understanding of white, hard, etc., or some similar cluster of ideas of sensation. But it was not Locke's way thus to ignore facts. He sees that something more is needed than these ideas of sensation. They are only *joined to* "the supposed or confused idea of substance," which is there and "always the first and chief" (Bk. 2:12:6). He holds to it that the idea is a complex idea and so mad by the mind; but he is entirely at a loss to account for the materials out of which it is made. We cannot imagine how simple ideas can subsist by themselves, and so "we accustom ourselves to suppose some substratum wherein they do subsist," and this we call substance. In one place, he even vacillates between the assertions that we have no clear idea of substance and that we have no idea of it at all " (Bk. 1:3:19). It is "a supposition of he knows not what." This uncertainty, as will appear presently, throws its shadow over our whole knowledge of nature.

Primary and Secondary Qualities.

The "new way of ideas" is thus hard put to it in accounting for the universal element in knowledge; it has even greater difficulties to face in defending the reality of knowledge. And, in the latter case, the author does not see the difficulties so clearly. His view is that the simple idea is the test and standard of reality. Whatever the mind contributes to our ideas removes them further from the reality of things; in becoming general, knowledge loses touch with things. But not all simple ideas carry with them the same significance for reality. Colours, smells, tastes, sounds, and the like are simple ideas, yet nothing resembles them in the bodies themselves; but, owing to a certain bulk, figure, and motion of their insensible parts, bodies have "a power to produce those sensations in us." These, therefore, as called "secondary qualities of bodies." On the other hand, "solidity, extension, figure, motion or rest, and number" are also held by Locke to be simple ideas; and these are resemblances of qualities in body; "their patterns do really exist in the bodies themselves"; accordingly, they are "primary qualities of bodies." In this way, by implication if not expressly, Locke severs, instead of establishing, the connection between simple ideas and reality. The only ideas which can make good their claim to be regarded as simple ideas have nothing resembling them in things. Other ideas, no doubt, are said to resemble bodily qualities (an assertion for which no proof is given and none is possible); but these ideas have only a doubtful claim to rank as simple ideas. Locke's prevailing tendency is to identify reality with the simple idea, but he sometimes comes close to the opposite view that the reference to reality is the work of thought.

Knowledge of Mathematics, Ethics, the Self, and God.

In the fourth book of his *Essay* Locke applies the results of the earlier books to determine the nature and extent of knowledge. As ideas are the sole immediate objects of the mind, knowledge can be nothing else than "the perception of the connexion of and agreement, or disagreement and repugnancy, or any of our ideas." This agreement or disagreement is said to be of four sorts: identity or diversity; relation; co-existence or necessary connection; real existence. Each of these kinds of knowledge raises its own questions; but, broadly speaking, one distinction may be taken as fundamental. In the same paragraph in which he restricts knowledge to the agreement or disagreement of our ideas, he admits one kind of knowledge which goes beyond the ideas themselves to the significance which they have for real existence. When the reference does not go beyond the ideas "in the mind,"

the problems that arise are of one order; when there is a further reference to real things, another problem arises.

Locke also distinguishes between two degrees of knowledge: intuition and demonstration. In the former case, the agreement or disagreement is immediately perceived; in the latter, it is perceived through the mediation of a third idea, but each step in the demonstration is itself an intuition, the agreement or disagreement between the two ideas compared being immediately perceived. He believes that mathematics and ethics are demonstrable. When ideas are together in the mind, we can discover their relation to one another; so long as they are not taken to represent archetypes outside the mind, there is no obstacle to certainty of knowledge. "All relation terminates in, and is ultimately founded on, those simple ideas we have got from sensation or reflection" (Bk. 2:28:18). but "general and certain truths, are only founded in the habitudes and relations of abstract ideas" (Bk. 4:12:7). In this way Locke vindicates the certainty of mathematics: although instructive, the science is merely idea, and its propositions do not hold of things outside the mind. He thinks also that "morality is capable of demonstration as well as mathematics." But, in spite of the request of his friend Molyneux, he never set out his ethic doctrine in detail. In Book II he reduced moral good and evil to pleasure and pain which -- as reward and punishment -- come to us from some lawgiver; thus they point to a source outside the mind. But his ground for maintaining the demonstrative character of morality is that moral ideas are "mixed modes," and therefore mental products, so that their "precise real essence ... may be perfectly known." He ventures upon two examples only of this demonstrative morality; and neither of them is more than verbal or gives any information about good or evil. Yet the doctrine is significant as showing the influence upon Locke of another type of demonstrative thought.

Thus, knowledge of mathematics and ethics may be firmly establish, particularly as these subjects involve relations between ideas, and thus make no claims about matters of real existence. When it comes to knowledge of real existence, though, ultimately there are only two certainties: the existence of ourselves (by intuition) and that of God (by demonstration).

Concerning the self, Locke agrees with Descartes that the existence of the self is implied in every state of consciousness. Every element of our experience, every idea of which we are conscious, is a certificate of our own existence, as the subject of that experience:

> As for *our own existence*, we perceive it so plainly and so certainly, that it neither needs nor is capable of any proof. For nothing can be more evident to us than our own existence. I think, I reason, I feel pleasure and pain: can any of these be more evident to em than my own existence? If I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt of that. For if I know I feel pain, it is evident I have as certain perception of my own existence, as of the pain I feel: or if I know I doubt, I have ascertain perception of the existence of the thing doubting, as of that thought which I *call doubt*.

However, Locke fails to point out how the self can be an idea and thus belong to the material of knowledge. An idea of the self cannot come from sensation; and the simple ideas of reflection are all of mental operations, and not of the subject or agent of these operations. On the other hand, when he had occasion to discuss personal identity, he followed his new way of idea, and made it depend on memory.

Concerning God's existence, his proof is a cosmological-type argument. From the certainty of our own existence that of the existence of God immediately follows. A person knows intuitively that he

is "something that actually exists." Next a person knows with intuitive certainty, that "bare *nothing can no more produce any real being, than it can be equal to two right angles.*" it is, therefore, "an evident demonstration, that *from eternity there has been something*. And since all the powers of all beings must be traced to this eternal Being, it follows that it is the most powerful, as well as the most knowing, that is, God. Eternal ind alone can produce "thinking, perceiving beings, such as we find ourselves to be" (Bk. 4:10). Locke here assumes, without question, the validity of the causal principle even beyond the range of possible experience.

Sensitive Knowledge of the External World.

Below the rank of knowledge proper (intuitive and demonstrative), Locke recognizes a third degree of knowledge, not strictly entitled to the name. This is our sensitive apprehension of external things, or of real objects other than ourselves and God:

> **These two, viz. intuition and demonstration, are the degrees of our *knowledge*; whatever comes short of one of these, with what assurance soever embraced, is but *faith* or *opinion*, but not knowledge, at least in all general truths. There is, indeed, another perception of the mind, employed about *the particular existence of finite beings without us*, which, going beyond bare probability, and yet not reaching perfectly to either of the foregoing degrees of certainty, passes under the name of *knowledge*. There can be nothing more certain than that the idea we receive from an external object is in our minds: this is intuitive knowledge. But whether there be anything more than barely that idea in our minds; whether we can thence certainly infer the existence of anything without us, which corresponds to that idea, is that whereof some men think there may be a question made; because men may have such ideas in their minds, when no such thing exists, no such object affects their senses. (Bk. 4:14)**

Does not the very definition of knowledge, as the perception of the agreement or disagreement of ideas with one another, preclude the perception of the agreement of ideas with non-ideal reality?

Locke's argument for the objective validity of sensitive knowledge consists of several considerations. First, he urges, our ideas of sensation differ from those of memory and imagination, that is from *mere* ideas, in being produced in us without any action of our own, and therefore "must necessarily be the product of things operating on the mind, in a natural way, and producing therein those perceptions which by the Wisdom and Will of our Maker they are ordained and adapted to." They,

> **carry with them all he conformity which is intended; or which our state requires: for they represent to us things under those appearances which they are fitted to produce in us: whereby we are enabled to distinguish the sorts of particular substances, to discern the states they are in, and so to take them for our necessities, and apply them to our uses. (Bk. 4:4:4)**

Secondly, pleasure or pain often accompanies the sensation, and is absent from the idea as it recurs in memory or imagination; and "this certainty is as great as our happiness or misery, beyond which we have no concernment to know or to be" (Bk. 4:2:14). Thirdly, our several senses assist one another's testimony, and thus enable us to predict our sensational experience. On these grounds Locke concludes that,

> **the certainty of things existing *in rerum natura* when we have the testimony of our senses for it is not only as great as our frame can attain to, but as our condition needs.**

> For, our faculties being suited no to the full extent of being, nor to a perfect, clear, comprehensive knowledge of things free from all doubt and scruple; but to the preservation of us, in whom they are; and accommodated to the use of life: they serve to our purpose well enough, if they will but give us certain notice of those things, which are convenient or inconvenient to us. (Bk. 4:2:14)

The certainty which Locke attributes to sensitive knowledge is thus seen to be practical, rather than theoretical; and it is impossible to distinguish this degree of knowledge from the belief or opinion which results from a balance of probabilities rather than from certain perception.

But even granting that our sensitive apprehensions of external reality possesses the certainty which is the characteristic of knowledge, as distinguished from mere opinion, we must observe within how very narrow limits it is confined:

> When our senses do actually convey into our understandings any idea, we cannot but be satisfied that there doth something *at that time* really exist without us, which doth affect our senses, and by them give notice of itself to our apprehensive faculties, and actually produce that idea which we then perceive: and we cannot so far distrust their testimony, as to doubt that such *collections* of simple ideas as we have observed by our senses to be united together, do really exist together. But this knowledge extends as far as the present testimony of our senses, employed about particular objects that do then effect them, and no further. (Bk. 4:11:9)

We cannot demonstrate the necessity of the co-existence of those ideas which constitute the modes or qualities of substances; we cannot perceive their "necessary connexion or repugnancy." The connection between the secondary and the primary qualities remains inexplicable. "And therefore there are very few general propositions to be made concerning substances, which carry with them undoubted certainty" (Bk. 4:6:76). "Our knowledge in all these inquires reaches very little further than our experience" (Bk. 4:3:13-14). Beyond the strict warrant of experience, or the testimony of our senses, we may venture upon "opinion" or "judgment" as to the co-existence of the qualities of substances, but we cannot strictly "know". "Possibly inquisitive and observing men may, by strength of judgment, penetrate further, and, on probabilities taken from wary observation, and hints well laid together, often guess right at what experience has not yet discovered to them. But this is but guessing still; it amounts only to opinion, and had not that certainty which is requisite to knowledge" (Bk. 4:6:13)

Locke finds himself compelled, therefore, to conclude that the so-called "science" of which Bacon had talked so proudly, and of whose achievements he had himself spoken so respectfully in the opening pages of the *Essay*, is not, in the strict sense, science at all; that, in his own words, there can be "no science of bodies." It is vain to search for the "forms" of the various material substances, or to seek to verify "the corpuscularian hypothesis" as to the connection of the primary and the secondary qualities of things. "I am apt to doubt that, how far soever human industry may advance useful and experimental philosophy in physical things, *scientifical* will still be out of our reach.... *Certainty* and *demonstration* are things we must not, in these matters, pretend to" (Bk. 4:3:26).

If we cannot attain to a science of bodies, still less can we expect "scientifical" understanding of spirits. Spiritual substance is, as we have seen, as unknown as material substance; and Locke finds additional reasons for limiting our knowledge in this sphere.

> If we are at a loss in respect of the powers and operations of bodies, I think it is easy to

> conclude we are much more in the dark in reference to spirits; whereof we naturally have no ideas but what we draw from that of our own, by reflecting on the operations of our own souls within us, as far as they come within our observation. But how inconsiderable rank the spirits that inhabit our bodies hold amongst those various and possibly innumerable kinds of nobler beings; and how far short they come of the endowments and perfections of cherubim and seraphim, and infinite sorts of spirits above us, is what by a transient hint in another place I have offered to my reader's consideration.

Judgment. The closing chapters of Book IV of the *Essay* are devoted to a consideration of that kind of apprehension of reality which Locke calls "judgment," as distinguished from "knowledge." "The faculty which God has given man to supply the want of clear and certain knowledge, in cases where that cannot be hand, is *judgment*: whereby the mind takes its ideas to agree or disagree; or, which is the same, any proposition to be true or false, without perceiving a demonstrative evidence in the proofs" (Bk 4:19:1-2). So-called "scientific" truths being generally of this kind, one would have expected Locke to give here some account of the procedure of inductive science, some directions for the careful and methodical study of the facts, and cautions against the temptations to hasty and unwarranted generalization, such as we find in Bacon's *Novum Organum*. But instead of this, he contents himself with general observations on the degrees of assent, on reason (and syllogism), on faith and reason, on "enthusiasm," and on wrong assent, or error. The treatment of, that is to say, is limited to general considerations regarding the function of faith and the relations of faith and reason as guides of the human mind.

What is especially significant here is Locke's refusal to oppose faith and reason in the fashion of Bacon and Hobbes, and his refusal to accept any authority which cannot vindicate itself through reason. Even in his insistence upon the necessity of supplementing our knowledge by faith, Locke emphasized the use of reason:

> Faith is nothing but a firm assent of the mind: which, if it be regulated, as is our duty, cannot be afforded to anything but upon good reason; and so cannot be opposite to it. He that believes without having any reason for believing, may be in love with his own fancies; but neither seeks truth as he ought, nor pays the obedience due to his maker.... (Bk. 4:27:24)

Locke is at one with the rationalist theologians of his century in their antagonism to an "enthusiasm" which would substitute for the insight of reason and of rational faith, the so called "revelation" of private experience. Against such a view, he insists upon the necessity of judging revelation by reason: "God when he makes the prophet does not unmake the man. He leaves all his faculties in the natural state, to enable him to judge of his inspirations, whether they be of *divine* original or no.... *Reason must be our last judge and guide in everything*" (Bk. 4:19:14).

Yet reason clearly limits the field of its own insight; it is only reasonable to believe where we cannot know and yet must act. However, as morality and religion cannot be compassed by reason, such knowledge must be supplemented by faith if we are to fulfill our divine destiny. This is the point of view, not only of the closing chapters of the *Essay*, but of his *Resonableness of Christianity* (1695). The aim of this treatise is to recall men from the contentions of the theological schools to the simplicity of the gospel as the rule of human life.:

> The writers and wranglers in religion fill it with niceties, and dress it up with notions,

> which they make necessary and fundamental parts of it; as if there were no way into the church, but through the academy or lyceum. The greatest part of mankind have not leisure for learning and logic, and superfine distinctions of the schools.

What people need is not intellectual insight or theological dogma, but practical guidance. Locke seems less confident than he was in the *Essay* of the possibility of a rational science of morals. "It should seem, by the little that has hitherto been done in it, that it is too hard a task for unassisted reason to establish morality, in all its parts, upon its true foundation, with a clear and convincing light.... It is plain, in fact, that human reason unassisted failed men in its great and proper business of morality."

Two Treatises of Government. In *Two Treatises of Government* he has two purposes in view: to refute the doctrine of the divine and absolute right of the Monarch, as it had been put forward by Robert Filmer's *Patriarcha*, and to establish a theory which would reconcile the liberty of the citizen with political order. The criticism of Filmer in the first *Treatise* is complete. His theory of the absolute sovereignty of Adam, and so of kings as Adam's heirs, has lost all interest; and Locke's argument has been only too effective: his exhaustive reply to so absurd a thesis becomes itself wearisome. Although there is little direct reference to Hobbes, Locke seems to have had Hobbes in mind when he argued that the doctrine of absolute monarchy leaves sovereign and subjects in the state of nature towards one another. The constructive doctrines which are elaborated in the second treatise became the basis of social and political philosophy for generations. Labor is the origin and justification of property; contract or consent is the ground of government and fixes its limits. Behind both doctrines lies the idea of the independence of the individual person. The state of nature knows no government; but in it, as in political society, men are subject to the moral law, which is the law of God. Men are born free and equal in rights. Whatever a man "mixes his labour with" is his to use. Or, at least, this was so in the primitive condition of human life in which there was enough for all and "the whole earth was America." Locke sees that, when men have multiplied and land has become scarce, rules are needed beyond those which the moral law or law of nature supplies. But the origin of government is traced not to this economic necessity, but to another cause. The moral law is always valid, but it is not always kept. In the state of nature all men equally have the right to punish transgressors: civil society originates when, for the better administration of the law, men agree to delegate this function to certain officers. Thus government is instituted by a "social contract"; its powers are limited, and they involve reciprocal obligations; moreover, they can be modified or rescinded by the authority which conferred them. Locke's theory is thus no more historical than Hobbes's. It is a rendering of the facts of constitutional government in terms of thought, and it served its purpose as a justification of the Revolution settlement in accordance with the ideas of the time.

Economic Writings. Locke's writings on economic subjects do not rank in importance with his treatises on government. They deal with particular questions raised by the necessities of the political situation. No attempt had yet been made to isolate the fact of wealth and make it the subject of a special science. The direction of industry and commerce was held to be part of the statesman's duty; but, in the seventeenth century, it began to be carried out with less thoroughness than before; and at the same time new problems were opened up by the growth of the national life. The American colonies, the enterprise of the East India Company, the planting of Ireland, the commercial rivalry with Holland and withy France, as well as questions regarding the rate of

interest and the currency, occupied the attention of a crowd of writers in the second half of the century. Locke's own contributions were occasioned be the financial problems which faced the new government after the revolution. His reflections on the rate of interest show the growing disfavor with which appeals for state interference were beginning to be met. He points out the obstacles to trade that are caused when the rate of interest is fixed by law, and he argues in favor of freedom for what he calls, in words which suggest Adam Smith, "the natural interest of money." Money "turns the wheels of trade"; therefore its course should not be stopped. At the same time, he holds no general brief against the interference of the state in matters of commerce; nor is the language of the mercantilist foreign to him. Riches consist in plenty of gold and silver, for these command all the conveniences of life. Now, "in a country not furnished with mines, there are but two ways of growing rich, either conquest or commerce." For us commerce is the only way; and Locke condemns "the amazing politics of some late reigns" which had "let in other competitors with us for the sea." In the concluding portion of *Some Considerations of the Consequences of the Lowering of Interest and Raising the Value of Money* (1691), Locke laid stress on the importance of a uniform and stable measure of values; four years later, in his *Further Considerations* he defended his view against the proposals involving a depreciation of the standard, which William Lowndes, secretary of the treasury, had set forth in *An Essay for the amendment of the silver coins* (1695).

Letters on Religious Toleration.

Locke's plea for toleration in matters of belief has become classical. His *Common-Place Book* shows that his mind was clear on the subject more than twenty years before the publication of his first *Letter*. The topic, indeed, was in the air all through his life, and affected him nearly. When he was a scholar at Westminster, the powers of the civil magistrate in religious matters were the subject of heated discussion between Presbyterians and independents in the assembly of divines that held its sessions within a stone's throw of his dormitory; and, when he entered Christ Church, John Owen, a leader of the independents, had been recently appointed to the deanery. There had been many arguments for toleration before this time, but they had come from the weaker party in the state. Thus Jeremy Taylor's *Liberty of Prophesying* appeared in 1646, when the fortunes of his side had suffered a decline. For Owen the credit has been claimed that he was the first who argued for toleration "when his party was uppermost." He was called upon to preach before the House of Commons on January 31, 1649, and performed the task without making any reference to the tragic event of the previous day; but to the published sermon he appended a remarkable discussion on toleration. Owen did not take such high ground as Milton did, ten years later, in his *Treatise of Civil Power in Ecclesiastical Causes* -- affirming that "it is not lawful for any power on earth to compel in matters of religion." He abounds in distinctions, and indeed his position calls for some subtlety. He holds that the civil magistrate has duties to the church, and that he ought to give facilities and protection to its ministers, not merely as citizens but as preachers of "the truth"; on the other hand he argues that civil or corporeal penalties are inappropriate as punishments for offences which are purely spiritual.

The position ultimately adopted by Locke is not altogether the same as this. He was never an ardent puritan; he had as little taste for elaborate theologies as he had for scholastic systems of philosophy; and his earliest attempt at a theory of toleration was connected with the view that in religion, "articles in speculative opinions [should] be few and large, and ceremonies in worship few and easy." The doctrines which he held to be necessary for salvation would have seemed to John Owen a meager and pitiful creed. And he had a narrower view also of the functions of the state.

"The business of laws," he says,

> **is not to provide for the truth of opinions, but for the safety and security of the commonwealth, and of every particular man's goods and person. And so it ought to be. For truth certainly would do well enough, if she were once left to shift for herself. She seldom has received, and I fear never will receive, much assistance from the power of great men, to whom she is but rarely known, and more rarely welcome. She is not taught by laws, nor has she any need of force, to procure her entrance into the minds of men. Errors, indeed, prevail by the assistance of foreign and borrowed succors. But if truth makes not her way into the understanding by her own light, she will be but the weaker for any borrowed force violence can add to her.**

A church, according to Locke, is "a free and voluntary society"; its purpose is the public worship of God; the value of worship depends on the faith that inspires it: "all the life and power of true religion consists in the inward and full persuasion of the mind;" and these matters are entirely outside the jurisdiction of the civil magistrate. Locke therefore (to use later language) was a voluntary in religion, as he was an individualist on questions of state interference. There is an exception, however, to his doctrine of the freedom of the individual in religious matters. The toleration extended to all others is denied to papists and to atheists; and his inconsistency in this respect has been often and severely criticized. But it is clear that Locke made the exception not for religious reasons but on grounds of state policy. He looked upon the Roman Catholic as dangerous to the public peace because he professed allegiance to a foreign prince; and the atheist was excluded because, on Locke's view, the existence of the state depends upon a contract, and the obligation of the contract, as of all moral law, depends upon the divine will.

Theological Writings. Locke's theological writings exhibit the characteristic qualities which his other works have rendered familiar. The traditions of theologians are set aside in them much as philosophical tradition was discarded in the *Essay*. He will search the Scriptures for religious doctrine just as he turned to experience for his philosophy, and he follows a method equally straightforward. Locke does not raise questions of Biblical criticism, such as Hobbes had already suggested and some of his own followers put forward soon afterwards; and the conclusions at which he arrives are in harmony with the Christian faith, if without the fulness of current doctrine. At the same time, his work belongs to the history of liberal theology and is intimately connected with the deism which followed; it treats religion like any other subject, and interprets the Bible like any other book; and, in his view of the nature of religion, he tends to describe it as if it consisted almost entirely in an attitude of intellectual belief -- a tendency which became more prominent in the course of the eighteenth century.

Educational Writings. Locke's *Thoughts concerning Education* and his *Conduct of the Understanding* occupy an important place in the history of educational theory, though only a scanty reference can be made to them here. The subject had a right to prominence in his thought. The stress he laid n experience in the growth of mind led him to magnify, perhaps overmuch, the power of education. He held that "the minds of children [are] as easily turned, this way or that, as water itself." He underrated innate differences: "we are born with faculties and powers, capable almost of anything;" and, "as it is in the body, so it is in the mind, practice makes it what it is." Along with this view went a profound conviction of the importance of education, and of the breadth of its aim. It has to fit men for life -- for the world, rather than for the university. Instruction in knowledge does not exhaust it; it is essentially a training of character.

Logical Positivism

(Also known as logical empiricism, logical neopositivism, neopositivism). School of philosophy risen in Austria and Germany during 1920s, primarily concerned with the logical analysis of scientific knowledge. Among its members were Moritz Schlick, founder of the Vienna Circle, Rudolf Carnap, the leading figure of logical positivism, Hans Reichenbach, founder of the Berlin Circle, Herbert Feigl, Philipp Frank, Kurt Grelling, Hans Hahn, Carl Gustav Hempel, Victor Kraft, Otto Neurath, Friedrich Waismann.

Logical positivists denied the soundness of metaphysics and traditional philosophy; they asserted that many philosophical problems are indeed meaningless. During 1930s the most important representatives of logical positivism emigrated to USA, where they influenced American philosophy. Until 1950s logical positivism was the leading philosophy of science; today its influence persists especially in the way of doing philosophy, in the great attention given to the analysis of scientific thought and in the definitely acquired results of the technical researches on formal logic and the theory of probability.

CONTENTS.

The following paragraph (*The main philosophical tenets of logical positivism*) explains the fundamental principles of logical positivism, namely the verifiability principle and its consequence, the logical structure of scientific theories and the meaning of probability. The paragraph *Biographical notes* gives essential information about the life of Feigl, Frank, Grelling, Hahn, Neurath, Schlick and Waismann, with some neopositivist's philosophical ideas that, for sake of exposition, did not find room in the principal text. There are three separate articles about Carnap, Hempel and Reichenbach. The historical development of logical positivism is outlined in three paragraphs: *Before the logical positivism*, which deals with the main influences that were exerted on the rising logical positivism; *Early researches in Europe* and *The American period*, whose titles are self-explanatory. Finally, the influences exerted by logical positivism on English, French, Italian, Polish and Scandinavian philosophy are sketched out in the paragraph *Influences on European philosophy*.

THE MAIN PHILOSOPHICAL TENETS OF LOGICAL POSITIVISM. According to logical positivism, there are only two sources of knowledge: logical reasoning and empirical experience. The former is analytic a priori, while the latter is synthetic a posteriori; hence synthetic a priori does not exist.

> **The fundamental thesis of modern empiricism consists in denying the possibility of synthetic a priori knowledge.**
> **(H. Hahn, O. Neurath, R. Carnap, *Wissenschaftliche Weltauffassung. Der Wiener Kreis*, 1929).**

Logical knowledge includes mathematics, which is reducible to formal logic. Empirical knowledge includes physics, biology, psychology, etc. Experience is the only judge of scientific theories; however, logical positivists were aware that scientific knowledge does not exclusively rise from the experience: scientific theories are genuine hypotheses that go beyond the experience.

> **It is not possible to establish a logically durable building on verifications [a verification is an observational statement about immediate perception], for they are already vanished when the building begins. If they were, with respect to time, at the beginning of the knowledge, then they would be logically useless. On the contrary, there is a great difference when they are at the end of the process: with their help the test is performed... From a logical point of view, nothing depends on them: they are not premises but a firm end point.**
> **(M. Schlick, '&Uumlber das Fundament der Erkenntnis', in *Erkenntnis*, 4, 1934).**

A statement is meaningful if and only if it can be proved true or false, at least in principle, by means of the experience -- this assertion is called the verifiability principle. The meaning of a statement is its method of verification; that is we know the meaning of a statement if we know the conditions under which the statement is true or false.

> **When are we sure that the meaning of a question is clear? Obviously if and only if we are able to exactly describe the conditions in which it is possible to answer yes, or, respectively, the conditions in which it is necessary to answer with a no. The meaning of a question is thus defined only through the specification of those conditions...**
> **The definition of the circumstances under which a statement is true is perfectly *equivalent* to the definition of its meaning.**
> **... a statement has a meaning if and only if the fact that it is true makes a verifiable difference.**
> **(M. Schlick, 'Positivismus und Realismus' in *Erkenntnis*, 3, 1932).**

Metaphysical statements are thus forbidden: they are meaningless. Also the traditional philosophy is indeed meaningless, and the only role of philosophy is the clarification of the meaning of statements.

> **Philosophy is the activity by means of which the meaning of statements is clarified and defined.**
> **(M. Schlick, 'Die Wende der Philosophie' in *Erkenntnis*, 1, 1930).**

A scientific theory is an axiomatic system that obtains an empirical interpretation through appropriate statements called rules of correspondence, which establish a correlation between real objects (or real processes) and the abstract concepts of the theory. The language of a theory includes two kinds of terms: observational and theoretical. The statements of a theory are divided

in two groups: analytic and synthetic. Observational terms denote objects or properties that can be directly observed or measured, while theoretical terms denote objects or properties we cannot observe or measure but we can only infer from direct observations. Analytic statements are a priori and their truth is based on the rules of the language; on the contrary, synthetic statements depend on experience, and their truth can be acknowledged only by means of the experience. This conception about the structure of scientific theories is perhaps the most durable philosophical principle of the logical positivism. It was proposed by H. Reichenbach and R. Carnap -- see H. Reichenbach, *Philosophie der Raum-Zeit Lehre*, 1928 (English translation: *The philosophy of space and time*, 1958) and R. Carnap, 'Testability and meaning' in *Philosophy of science*, 3, 1936 and 4, 1937 -- and was supported by C. G. Hempel, *Fundamentals of concept formation in empirical science*, 1952; R. B. Braithwaite, *Scientific explanation*, 1953; E. Nagel, *The structure of science*, 1961; R. Carnap, *Philosophical foundations of physics*, 1966; M. Ruse, *Philosophy of biology*, 1971. Its main points are:

- **the distinction between observational and theoretical terms**
- **the distinction between synthetic and analytic statements**
- **the distinction between theoretical axioms and rules of correspondence**
- **the deductive nature of scientific theories**

These four points are linked together. Rules of correspondence give an empirical meaning to theoretical terms and are analytic, while theoretical axioms express the observational portion of the theory and are synthetic. A theory must be a deductive systems; otherwise, a formal distinction between the various kinds of sentences and terms is impossible.

The distinction between observational and theoretical terms depends on the verifiability principle. A statement is meaningful only if it is verifiable; but, in scientific theories, there are many statements which are not verifiable -- for example, assertions dealing with quantum particles or relativistic gravitational fields. These statements are too abstract for a direct test; strictly speaking, they are meaningless. To avoid such a consequence, two different approaches were proposed. According to Schlick, the principles of a scientific theory are not statements, but rules of inference; hence the problem of their meaning does not arise ('Die Kausalität in der gegenwärtigen Physik' in *Die Naturwissenschaften*, 19, 1931). The other solution was proposed by Neurath: the terms which belong to the abstract language of a scientific theory are explicitly definable in a restricted language whose terms describe directly observable objects ('Physikalismus' in *Scientia*, 50, 1931). So a distinction between observational and theoretical terms arose. But soon Carnap realized that theoretical terms are not definable by observational ones. In a first time, he proposed a partial reducibility of theoretical to observational terms ('Testability and meaning', in *Philosophy of science*, 3, 1936 and 4, 1937). Later, it was supposed that all theoretical terms were removable from a scientific theory. This hypothesis was supported by two outcomes of formal logic: Craig theorem and Ramsey statement.

Craig theorem is an unquestionable result of formal logic. Let A and B be two set of statements, so that B is a logical consequence of A. Craig proved that (i) there is a set C of statements whose terms are common to A and B, (ii) C is a logical consequence of A and (iii) B is a logical consequence of C. Therefore, if A is the set of axioms of a scientific theory and B is the set of observational statements implied by A, then there is a set C, whose terms are common to A and B and thus they are the observational terms which occur in the axioms, so that C entails B and is a

consequence of A. According to Craig theorem, it is possible to translate a scientific theory in a purely observational language without any loss of deductive power.

Ramsey sentence, named after English philosopher Frank Plumpton Ramsey (1903-1930), was used by Carnap for dividing the axioms of a theory in two sets, say A and R, so that R contains only observational terms and expresses the empirical portion of the theory, while A is analytic and defines the meaning of theoretical terms (see Carnap for a full explanation).

Given a theory T, it is thus possible to build a theory T* without theoretical terms so that T and T* are equivalent with respect to observational statements, that is every observational statement O is a logical consequence of T if and only if is a logical consequence of T*.

While the analysis of relationships between the two kinds of terms began the object of many logical and philosophical studies, the distinction itself was criticized. According to Popper all scientific concepts are theoretical, for every assertion not only entails hypotheses but also is hypothetical, that is not sure and always falsifiable. Quine ('Two dogmas of empiricism' in *The Philosophical Review*, 60, 1951) criticized both observational-theoretical and analytic-synthetic distinction. Hempel ('The theoretician's dilemma' in *Minnesota studies in the philosophy of science*, II, 1958) noted that the theory T* without theoretical terms, in spite of the equivalence (with respect to the observational language) to the original theory T, is not useful as T. In fact, from an inductive point of view, T and T* are very different. Usually the original theory T suggests certain relations between its concepts, while in T* these concepts are forbidden. The discovery of laws is almost impossible in T*, while it is a natural consequence in T. Moreover, while the number of the axioms of T usually is finite, Craig theorem does not assure us of the existence of a theory T* with a finite number of axioms. So T* is almost useless. Theoretical terms are thus necessary in science.

Hempel's work 'The meaning of theoretical terms' in *Logic, methodology and philosophy of science IV*, 1973, includes a new criticism of the observational-theoretical distinction. The two main points of Hempel's analysis are:

- **Observational terms do not exist. It is only possible a distinction between terms used in a given theory and new terms employed for the first time in a new scientific theory. For example, Bohr's atomic theory includes terms like quantum numbers, quantum jump, steady state, and explains spectra described with the help of wavelength. Now wavelength is an 'old term' while quantum number is a 'new term'. Thus the abstract concepts of atomic theory are linked with other abstract (but already given) concepts.**
- **The meaning of theoretical terms is not defined by analytic statements which are true by convention. In fact, every statement is subject to empirical tests. In a scientific theory there is no room for 'true by convention'.**

In *Philosophical foundations of physics*, 1966, Carnap proposed a slightly different approach to observational-theoretical distinction. Now the starting-point is the difference between empirical and theoretical laws. It is possible to directly confirm (or disprove) an empirical law, while a theoretical law can be tested only through the empirical laws that are among its consequences. Moreover, an empirical law explains facts while a theoretical law explains empirical laws. Thus there are three levels:

1. **Empirical facts.**
2. **Simple generalizations we can directly test: empirical laws. They explain facts and are**

employed to forecast facts.
3. General principles we can use to explain empirical laws: theoretical laws.

Empirical laws include observational terms, while theoretical terms occur in theoretical laws.

The distinction between analytic and synthetic statements is another consequence of the verifiability principle and it is linked with the observational-theoretical as well as axioms-rules of correspondence distinction. According to the verifiability principle, an alleged synthetic a priori statement does not have a meaning; thus there are only two kinds of assertions: synthetic a posteriori and analytic a priori. First of all, what is the role of analytic sentences in a scientific theory? Only two possibilities are allowed: an analytic statement is a logical-mathematical theorem (thus it has no empirical significance) or it is a convention that defines the meaning of theoretical terms. Really, the solution to the problem about the meaning of theoretical terms that Carnap proposed ('Beobacthungssprache und theoretische Sprache' in *Dialectica*, 12, 1958; English translation 'Observation language and theoretical language' in *Rudolf Carnap, logical empiricist*, 1975) was based on the analytic-synthetic distinction. Carnap's method (i) explains the meaning of theoretical terms and their relationships with observational concepts, (ii) gives a method for separating synthetic and analytic sentences and (iii) gives a method for dividing theoretical axioms from rules of correspondence. Roughly speaking:

- A syntactic characterization of the rules of correspondence was given: if A is the conjunction of all axioms and R is the Ramsey sentence, that R-->A is the only rule of correspondence (R-->A is called Carnap sentence).
- Analytic statements are logical consequence of Carnap sentence.
- Synthetic statements are logical consequence of Ramsey sentence.

There is an explicit assumption in logical positivism's analysis of science: a theory is a deductive system. This means that pragmatic aspects are not considered. Moreover, neopositivism was not interested in the real process of discovering, but it was concerned with the rational reconstruction of scientific knowledge, that is it dealt with logical (formal) relationships between statements in a given theory. According to logical positivism, there is not any method of discovering, and therefore a scientist can propose every hypothesis he prefers; only logical relationships between the hypothesis and the given empirical evidence are relevant. But there were some problems with this conception of science. First of all, the relation between empirical experience and theoretical principles is not a deductive one: observational statements do not imply theoretical axioms. Carnap argues that the relation is explicable with the help of the inductive logic. So we now must speak about inductive logic and probability.

There were two different theories about probability proposed by neopositivists:

- Frequency interpretation: the probability is the limit of a frequency. This theory is the preferred one in modern science and was formulated by Reichenbach and von Mises.
- Logical interpretation: the probability is the degree of confirmation a statement receives from a given set of other statements. Carnap, Hempel and Waismann were supporters of this hypothesis.

According to Reichenbach and von Mises, the meaning of a statement like 'the probability of P given Q is *r*' is that the limit of the relative frequency of objects P in the set of objects Q is *r*. That is, in a large sample of the set Q -- say *m* objects Q, where *m* is great -- there are *n* objects P, and

$\lim(n/m)=r$, where m tends to infinity. Therefore Reichenbach asserted that a statement about the probability of a single event is meaningless.

Waismann proposed a logical interpretation of probability in his work 'Logische Analyse des Wahrscheinlichkeitsbegriffs' in *Erkenntnis*, 1, 1930. His starting-point is Wittgenstein's interpretation of probability. According to Waismann, we have to use the theory of probability when we do not know whether a proposition is true or false. In that circumstance, we can study the logical relationships between the statements that express our knowledge and we can determine their relative probability. Hence a probability is a mathematical measure of a logical relationship between propositions. What is the role of frequency in the logical interpretation? First of all, it is possible that we know so little about a physical condition that we can determine the probability only a posteriori by means of the frequency. Therefore the relative frequency and the logical probability are obviously equal. In other circumstances, we can predict the probability through our knowledge of the relevant conditions and physical laws. In such situation, the frequency is used to verify the forecast.

Carnap was very interested in the problem about the probability of a single event. According to his interpretation the statement 'the probability that this single object P were Q is *r*' is a genuine statement. Its meaning is 'the statement "this single object P is Q" has a degree of confirmation *r*'. When $r=1$, the statement is true; when $r=0$ the statement is false; otherwise the statement has a certain portion of truth. Thus inductive logic, which is the study of logical relationships between statements whose degree of confirmation is different from 0 and 1, is an extension of classical logic and it is analytic, ie formal. So, according to Carnap, inductive logic explains the relationship between observational and theoretical statements. However, there is a great difficulty in that theory. The degree of confirmation of every universal law is always 0, for a universal law is a statement about a possibly infinite number of objects while every sample is finite. Hence the degree of confirmation of every scientific law with respect to every given experience is always 0. Another difficulty arose when Hempel formulated the so-called paradoxes of confirmation, according to which every universal law is supported by an apparently irrelevant evidence; for example, 'all ravens are black' is confirmed by the observation of a white shoe (see Hempel for further details).

Another consequence of the verifiability principle is that statements about ethical principles are neither true nor false; they are expressions of feeling (this theory is called noncognitivism). Therefore a theory of ethics is impossible. But if ethics is meaningless, a question rises: what is the origin of ethical principles? Among neopositivists, Schlick was the most interested in ethics; he endeavoured to give an account of ethics which was compatible with neopositivist philosophy. According to Schlick, ethics is a descriptive scientific theory. A man always prefers those conditions that do not produce pain or produce pleasure; thus, in a first time, good is whatever that gives pleasure and no pain. Good is thus equivalent to beneficial. Man's actions are caused by a wish to benefit himself. So the first ethical impulse is an egoistic one. But the motivations to act are not static: they are subjected to the natural evolution and selection. In a society, it is possible that an altruistic way of action is more beneficial that a purely egoistic one. So there is a contrast between the very first impulse, which suggests an egoistic behaviour, and the tendency to act generated by the evolution, which suggests a social behaviour. This is the origin of ethical principles.

BEFORE THE LOGICAL POSITIVISM. What are the main philosophical and scientific outcomes

that influenced the rise of logical positivism?

First of all, the theory of relativity exerted a great influence on logical positivism. Einstein's analysis of the empirical meaning of scientific concepts gave rise to the verifiability principle. The first published work on the special theory of relativity (Einstein's article 'Elektrodynamik bewegter K&oumlrper' in *Annalen der Physik*, 17, 1905) begins with a discussion on simultaneity and length which is one of the most rigorous application of the verifiability principle -- about twenty years before Schlick's formulation. Moreover, the first Carnap's work was an essay about the theory of space published in 1922; Reichenbach attended Einstein's lectures on the theory of relativity at Berlin in 1917 and wrote in 1920s four books on that theory; Schlick wrote in 1915 and 1917 two essays on relativity.

Another great influence on logical positivism was exerted by the development of formal logic. Carnap attended three courses on logic under the direction of G. Frege, the father of modern logic; from a philosophical point of view, Frege asserted that all arithmetic statements are analytic a priori, and thus he denied the existence of synthetic a priori statements in arithmetic -- note that for Frege geometry is synthetic a priori, because it is not reducible to logic; therefore, in Frege's opinion, analytic statements are those that are logically true. K. G&oumldel, the logician who proved the completeness of first order logic and the incompleteness of arithmetic, was a member of the Vienna Circle. Logical positivism had extensive contacts with the group of Polish logicians who developed several branches of contemporary logic. Polish philosophy was greatly influenced by Kazimierz Twardowski (1866-1938), who studied at Vienna and taught at Lwow; he is the founder of Polish analytic philosophy. He taught to several Polish philosophers and logicians; among them were:

- **Jan Lukasiewicz (1878-1956), who developed both the algebra of logic and a many-valued propositional calculus, which influenced Carnap's inductive logic (which was proposed as an extension of classical logic dealing with infinite-valued truth function) and Reichenbach's interpretation of quantum physics, in which Reichenbach employed a three-valued propositional calculus.**
- **Stanislaw Lesniewski (1886-1939), who was interested in the logical antinomies.**
- **Kazimierz Ajdukiewicz (1890-1963), who taught philosophy of language, epistemology and logic.**
- **Tadeusz Kotarbinski (1886-1981), who asserted that many alleged philosophical problems in fact are scientific problems, that is they are the object of empirical science and not of philosophy, which deals with logical and ethical problems only.**

Lukasiewicz and Ajdukiewicz published several essays in *Erkenntnis*, the journal of the logical positivism, edit by Carnap and Reichenbach. Alfred Tarski (1902-1983), who developed the theory of semantics in a formal language, took part to the congresses on scientific philosophy organized by Vienna and Berlin Circle; he greatly influenced Carnap's philosophy of language -- in a first time, Carnap was interested in logical syntax but, after the publication of Tarski's works, he turned to semantics.

Italian mathematician Giuseppe Peano (1858-1932) indirectly influenced the logical researches of neopositivists. He developed a logical symbolism adopted by Russell, now widely used. He proposed five axioms as a definition of the set of natural numbers. G&oumldel proved the incompleteness

theorem with respect to Peano's axiomatization.

Bertrand Russell's (1872-1970) mathematical logic exerted a major influence on logical positivism. Russell asserted the analytic character of the whole mathematics; he endeavoured to prove this assumption in his works *Principles of mathematics*, 1903, and *Principia mathematica*, 1910-13 (the last written with A. N. Whitehead). *Principia mathematica* is a skilful application of logic to mathematics, which gave rise to endless philosophical and technical researches.

Ernst Mach (1838-1916) -- physicist and philosopher, he taught physics at the University of Prague and theory of inductive science at Vienna -- is often regarded as a great source of inspiration to logical positivism (the official name of the Vienna Circle was Verein Ernst Mach, ie Ernst Mach Association). He was a radical empiricist, critized the absolute theory of space and time, published a philosophical and historical analysis of classical mechanics, and formulated the principle of economy of thought, according to which scientific theories are useful tools to make predictions, but they do not reflect an objective and independent reality. Mach's influence on early logical positivism is unquestionable. However, I will remark upon some differences between Mach and logical positivism.
Mach was an anti-realist: there is nothing but our sensations; on these grounds, he never accepted the reality of atoms. This extreme anti-realism was not congenial to logical positivists. Schlick, at least in the first stage of his philosophical development, was a realist: science give us a true description of an external world; he professed his admiration for Mach, but also asserted that Machian anti-realism was too extreme and did not correctly depict the real activity of scientists. According to Carnap, the whole question is about preferred mode of speech -- it is a question about language. In fact -- said Carnap -- realism and anti-realism are meaningless; obviously scientific theories are useful tools, but their language includes true or false genuine statements. It must be noted that Schlick, under the influence of Wittgestein's *Tractatus*, eventually asserted that only statements without quantifiers are meaningful and thus scientific laws are not statements, but they are rules of inference, prescriptions to make forecasts -- so Schlick partially rejected his realism and accepted an interpretation of scientific laws similar to Machian economy of thought.

> **The fundamental thesis of modern empiricism consists in denying the possibility of synthetic a priori knowledge.**
> **(H. Hahn, O. Neurath, R. Carnap, *Wissenschaftliche Weltauffassung. Der Wiener Kreis*, 1929).**

This statement shows the attitude of logical positivism towards Kantian philosophy. However, Kant was regarded as the last traditional philosopher interested in epistemology who, at the same time, had a scientific competence. Neopositivists dedicated several pages to disprove the Kantian theory of space and time, while nothing was said about such a philosopher as Hegel -- it is symptomatic of the importance they attributed to Kant. Among Reichenbach's teachers was neokantian philosopher Ernst Cassirer -- who wrote an essay on the theory of relativity in 1921 and on quantum physics in 1936 -- while Carnap wrote his dissertation under the direction of neokantian Bruno Bauer.

Wittgenstein's *Tractatus Logico-Philosophicus* exerted a great influence on Vienna Circle; many meetings were dedicated to a punctual analysis of that work. Not all neopositivists' reactions to *Tractatus* were positive: according to Neurath it was full of metaphysics. Carnap (in his Autobiography published in *The philosophy of Rudolf Carnap*) said that Wittgenstein's influence on

Vienna Circle was overestimated. Moreover, Wittgenstein did not take part to Vienna Circle's discussions; there were separate meetings between him, Schlick, Carnap and Waismann, but soon Carnap was not admitted to those meetings. Wittgenstein's influence is evident in the formulation of the verifiability principle. See for example Proposition 4.024 of *Tractatus*, where Wittgenstein asserts that we understand a proposition when we know what happens if it is true and compare with Schlick's assertion 'The definition of the circumstances under which a statement is true is perfectly *equivalent* to the definition of its meaning'. Wittgenstein influenced also the interpretation of probability. He asserted that every statement is a truth function of its atomic statements; for example, (A v B) is a statement whose truth depends on the truth of its atomic components A and B, according to the following truth-table.

A	B	A v B
T	T	T
T	F	T
F	T	T
F	F	F

Now suppose we know (A v B) is true and we want to know whether A is true. In the first, second and third row of the truth-table (A v B) is true. In two of those rows A is true too. So there is a probability 2/3 that A is true. That is, the probability of A given (A v B) is 2/3. The probability is thus a logical relation between two statements. It is very simple to find the probability of a statement P with respect to another statement Q. First of all, we write the truth-table of Q and count the rows where Q is true; suppose they are *m*. Among them, we count the rows where P is true, say *n*. The probability of P with respect to Q is thus *n*/*m*. This theory was accepted and used by Waismann ('Logische Analyse des Wahrscheinlichkeitsbegriffs' in *Erkenntnis*, 1, 1930). Waismann's work gave rise to an intense discussion with the Berlin Circle whose members -- namely von Mises and Reichenbach -- supported a frequency interpretation. Note also that this procedure is suitable only when the statements are not universal, that is P and Q must be statements without quantifiers. Really in *Tractatus* Wittgenstein argued that only simple propositions without quantifiers are meaningful. This point influenced Schlick's analysis of scientific laws.

**EARLY RESEARCHES IN EUROPE. A very important year in the history of the logical positivism was 1922: in that year Schlick moved from Prague to Vienna, where he held the chair of theory of inductive science. At that time, Schlick had already published several philosophical works which heralded the new philosophical point of view: *Raum und Zeit in der gegenwärtingen Physik*, 1917 (English translation: *Space and time in contemporary physics*, 1920) and *Allgemeine Erkenntnislehre*, 1918 (English translation: *General theory of knowledge*, 1974); also Reichenbach had already published *Relativitatstheorie und Erkenntnis apriori*, 1920 (English translation: *The theory of relativity and a priori knowledge*, 1965), a philosophical analysis of the theory of relativity against Kantian philosophy. Moreover, Hahn, Frank and Neurath had begun their meetings on philosophy of science in 1907. Why was the coming of Schlick in Vienna so important?
Schlick soon organized a discussion group and established relations with other philosophers of science and so the Vienna Circle took shape. Schlick called Carnap to Vienna and in 1926 Carnap became assistant professor under Schlick. Vienna Circle joined up with Berlin Circle (a similar group of philosophers of science that gathered round Reichenbach). Vienna Circle took many**

initiatives: among them, the publication of two series dedicated to the new philosophy of science; the journal *Erkenntnis*; the organization of several congresses on epistemology and philosophy of science.

Between 1924 and 1936 (in that year Schlick was murdered) there were many philosophical outcomes which gave shape to logical positivism. The verifiability principle was formulated; metaphysics was ruled out as not verifiable. Reichenbach published extensive analyses on the theory of relativity. Carnap was primarily interested in logical analysis of science, and he gave the first logical formulation of the verifiability principle. Wittgestein's *Tractatus* was discussed in Vienna Circle's meetings. Other philosophers were attracted by the new movement: Hempel studied with Reichenbach, Schlick and Carnap; Italian philosopher Geymonat went to Vienna and studied with Schlick and Carnap; American philosophers were interested in logical positivism; Morris and Quine went to Prague to meet Carnap; Polish logicians Ajdukiewicz and Lukasiewicz contributed essays to *Erkenntnis*; Popper published his *Logik der Forschung* in Vienna Circle's series.

In early 1930s logical positivism was an influential philosophical movement, known in USA and Europe; its members taught in many European universities and one of them (Feigl) in an American university. Logical positivism was not only interested in pure philosophical research, but also in political and educational activity. The ideas of its members were progressive, liberal and sometimes socialist. But in 1933 Hitler became Chancellor of Germany; Nazism was hostile towards neopositivism. In few years, many logical positivists were forced to emigrate; two of them (Schlick and Grelling) were murdered. USA became the new home for Carnap, Feigl, Frank, G&oumldel, Hempel and Reichenbach, while Neurath and Waismann sought refuge in England.

THE AMERICAN PERIOD. The spread of logical positivism in USA became in early 1930s. In 1929 and in 1932 Schlick was Visiting Professor at Stanford, while Feigl emigrated to USA in 1930, where he became lecturer (1931) and professor (1933) at the University of Iowa and afterwards at the University of Minnesota (1940). In 1932 the American Philosophical Association organized a discussion on the philosophy of logical positivism. In the same years several articles about logical positivism were published in American philosophical journals; among them were:

- **E. Nagel, 'Nature and convention' in *The Journal of Philosophy*, 26, 1929, in which Nagel discussed Reichenbach's interpretation of the theory of relativity.**
- **S. Hook, 'Personal impression of contemporary German philosophy' in *The Journal of Philosophy*, 27, 1930, a favourable report on logical positivism.**
- **A. E. Blumberg and H. Feigl, 'Logical positivism. A new movement in European philosophy' in *The Journal of Philosophy*, 28, 1931.**
- **C. I. Lewis, 'Experience and meaning' in *The Philosophical Review*, 43, 1934, a critical article on the verifiability principle.**
- **M. Schlick, 'Meaning and verification' in *The Philosophical Review*, 45, 1936, a reply to Lewis.**

In 1936 Schlick was murdered by a Nazi student at the University of Vienna. Between 1936 and 1940 several German and Austrian philosophers emigrated to USA: Carnap moved in 1936 to the University of Chicago, Reichenbach in 1938 to UCLA, Frank in 1938 (he became professor at Harvard University in 1939), Hempel in 1939 (City College of New York and in 1940 Queens

College), G&oumldel in 1940 (Institute for Advanced Study at Princeton).

Logical positivists found a favourable terrain in USA. They established solid relationships with American pragmatism; particularly Charles Morris took part to several neopositivist's projects. One of them was the *International Encyclopedia of Unified Science,* primarily promoted by Neurath. Although the original project was never fully realized, many works were indeed published.

For an analysis of the outcomes of logical positivists' researches, you can view Carnap, Hempel and Reichenbach; they were the most active and influential representatives of logical positivism. Now I shall briefly precise some lines of research.

Roughly speaking, there were four different fields of interest.

- **Philosophy of physics, mainly performed by Reichenbach and Frank. The former wrote about theory of relativity, quantum physics, philosophy of time; the latter wrote a biography of Einstein and an analysis of the theory of relativity.**
- **Theory of probability and inductive logic, a field in which Carnap made many works.**
- **Logical analysis of the structure of a scientific theory and its language. There were works of Hempel and Oppheneim on scientific explanation and confirmation; of Hempel and Carnap about concept formation in empirical science; a strenuous defence of the dichotomy between analytic and synthetic statements, due to Carnap, who also proposed several formal versions of the verifiability principle. General treatises were published by Braithwaite, Carnap, Hempel, Nagel.**
- **Finally, Carnap wrote several works on both classical and modal logic and about semantics.**

INFLUENCES ON EUROPEAN PHILOSOPHY. I have already depicted the relations between logical positivism and Polish philosophy; I must say that Polish philosophy greatly influenced logical positivism. In twentieth century, Polish philosophers were very interested in logical problems; their works contributed to the development of several branches of logic, such as semantics and many-valued logic. Polish logicians analyzed logical aspects of neopositivist philosophy. Marian Przelecki's work *The logic of empirical theories*, 1969, is a good example of such studies. In her work, Przelecki examined the logical structure of theories and proposed a semantic model of a formalized language suitable for a scientific theory. She used a relatively simple extension of Tarskian classical semantics. In her theory not all statements are true or false: a proposition can be indeterminate, that is neither true nor false (but the law of excluded middle is always true). Therefore there is at least a statement, say P, so that (i) P is not true; (ii) P is not false and (iii) Pv~P is true. A very interesting property of Przelecki's semantics is the following one. Let Ax be the set of axioms of a scientific theory and suppose that Ax is finite; let A be the conjunction of all statements in Ax. It is possible that A is false even if every statement in Ax is not false (ie, the conjunction of a finite number of assertions can be false even if every assertion is not false). This property is very useful in explaining a well-known situation: when a theory is proved false, it is often very difficult to determine the wrong axiom. Another outcome of Przelecki's theory is a semantic characterization of the rules of correspondence. It was proved that Carnap sentence is the weakest rule of correspondence, but it is not the only possible one. For example, suppose the following two statements are the only axioms in Ax:

$(x)(O_1x \dashrightarrow T_1x)$, $(x)(O_2x \dashrightarrow \sim T_1x)$

O_1, O_2 are observational terms and T_1 is a theoretical term. Every one of the following statements is an admissible rule of correspondence:

$(x)[(O_1x \vee O_2x) \dashrightarrow (T_1x \leftarrow\!\!\dashrightarrow O_1x)]$
$(x)[\sim(O_1x \,\&\, O_2x) \dashrightarrow ((O_1x \vee O_2x) \dashrightarrow (T_1x \leftarrow\!\!\dashrightarrow O_1x))]$
$(x)\sim(O_1x \,\&\, O_2x) \dashrightarrow (x)[(O_1x \vee O_2x) \dashrightarrow (T_1x \leftarrow\!\!\dashrightarrow O_1x)]$

The last statement is logically equivalent to Carnap sentence. Finally, a sentence S is analytic if and only if it is a logical consequence of the set of rules of correspondence; S is contradictory if and only if ~S is analytic; S is synthetic if and only if it is neither analytic nor synthetic.

English philosopher Alfred Jules Ayer (1910-1989) played an important role in the spreading of logical positivism. His work *Language, Truth and Logic*, 1936, gained an immediate success. In that book, Ayer completely accepted both the verifiability principle and the distinction between analytic and synthetic statements; hence he asserted that metaphysical sentences are meaningless. A direct influence was exerted by Waismann and Neurath who emigrated in England in 1937 and 1940 respectively. Waismann taught at Cambridge and, from 1939 to 1959, at Oxford, where he taught philosophy of mathematics and philosophy of science. During this period Waismann was very interested in the philosophy of Wittgenstein.

Relations between Italian philosophy and neopositivism arose in the early stages of logical positivism. Italian mathematician and philosopher of science Federigo Enriques (1871-1946) took part to the congresses on scientific philosophy and collaborated on the *International Encyclopedia*; Neurath and Carnap contributed articles to the journal *Scientia* edit by Enriques. In 1934 Ludovico Geymonat (1908-1991) published a work on logical positivism: *La nuova filosofia della natura in Germania*. Geymonat had the opportunity to study with Schlick, Reichenbach, Carnap and Waismann; later he held the first chair in Italy of philosophy of science (1956). However, the interest of Italian philosophy on logical positivism was primarily directed towards historical researches. Francesco Barone distinguished himself by his work *Il neopositivismo logico*, 1953, a detailed and up to date historical and philosophical analysis of logical positivism, that deserves mention for it focuses attention not only on Vienna Circle but also on the American period of logical positivism and on some philosophers sometimes forgotten (even now it is not impossible to find valuable dictionaries of philosophy that identify logical positivism with the Vienna Circle).

French philosophy was marginally interested in logical positivism. Charles E. Vouillemin translated several neopositivist's works and, in 1935, published *La logique de la science et l'ecole de Vienne*, a book in which he examined the philosophy of the Vienna Circle. Luis Rougier (1889-1982) gave reports about logical positivism ('Une philosophie nouvelle: l'empirisme logique' in *Reveu de Paris*, 63, 1935), collaborated on the *International Encyclopedia of Unified Science* and contributed works to *Erkenntnis*.

As early as 1930 Scandinavian philosophers were interested in logical positivism. Two of them, Swedish Ake Petzäll (1901-1957) and Finnish Eino Kaila (1890-1958), employed for the first time the expression 'logical neopositivism' for denoting the new philosophical movements (A. Petzäll, *Der logistische Neupositivismus*, 1930 and E. Kaila, 'Der logistische Neupositivismus' in *Annales Universitatis Aboensis*, ser. B, 13, 1930). Petzäll was mainly influenced by the Vienna Circle and in

1930-31 he went to Vienna, where he took part to Vienna Circle's meetings. Later (1935) he founded a new journal, *Theoria*, published in G&oumlteborg; in that journal Hempel published his very first description of the paradoxes of confirmation ('Le probl&egraveme de la v&eacuterité', 3, 1937). Eino Kaila published in 1939 a work pervaded by the principles of logical positivism (*The human knowledge*, in Finnish). He taught philosophy at the University of Helsinki. Among his students was George Henrik von Wright (b. 1916) who published a study about logical positivism (*The logical empiricism*, 1943, in Finnish). Wright contributed to the development of both modal and deontic logic. Finnish Jaakko Hintikka (b. 1929) -- among his teachers was Wright -- pursued Carnap's studies on inductive logic. Hintikka's article 'A two-dimensional continuum of inductive methods' in *Aspects of inductive logic* (ed. by J. Hintikka and P. Suppes), North Holland Pub. Co., 1966, extended the methods Carnap used in *The continuum of inductive methods*, 1952. Roughly speaking, Carnap defined a system of inductive logic in which there is a one-to-one correspondence between the function that gives the degree of confirmation of a statement and the function that gives the estimated relative frequency. The exact relationship between these two functions depends on only one parameter Carnap called *lambda*; it can assume all real values between 0 and infinity (thus the system is a continuum of inductive methods). Every value of *lambda* defines a different methods for evaluating the degree of confirmation. However, the probability of an universal law is always 0. Hintikka added a second parameter he called *alfa* so that the system became a two-dimensional continuum. When *alfa* = infinity Hintikka's system is identical with Carnap's one-dimensional system. Otherwise the two-dimensional system gives a reasonable degree of probability to universal laws even in an infinite universe.

Danish philosopher Joergen Joergensen (1894-1969) very actively collaborated with neopositivists. After Hanh's death (1934) he became an editor of the Vienna Circle's series *Einheitswissenchaft*; later he collaborated on the *International Encyclopedia* to which he contributed the essay *The development of logical empiricism*, 1951.

Finally, it must be noted that logical positivism played a very important role in the development of contemporary philosophy not only for its philosophical principles, but also for its editorial and organizational activities. It is not superfluous to remember that Popper and Kuhn published their most known and seminal works in neopositivist's series. This fact do not prove that Popper and Kuhn were neopositivists; but it shows the broad-mindedness, the kindly disposition and the lasting influence of logical positivism.

BIOGRAPHICAL NOTES.

Rudolf Carnap (1891 - 1970). See Carnap.

Herbert Feigl (Reichenberg, Austria, but now in Czech, 1902 - 1988). Philosopher of science. In 1921 he studied physics and chemistry at the University of Munich and in 1922 moved to Vienna, where he was an early member of the Vienna Circle. At Vienna he studied mathematics, philosophy, physics and psychology, and received his degree in philosophy in 1927. In 1929 he met K. R. Popper whose ideas he found interesting, so he encouraged Popper to write a book which became the *Logik der Forschung*. In 1930 Feigl emigrated to USA. His article (written with A. E. Blumberg) 'Logical positivism. A new movement in European philosophy' in *The Journal of Philosophy*, 28, 1931, was one of the first reports on logical positivism published in USA and promoted the spread of logical positivism. Between 1931 and 1940 he taught at the University of

Iowa and from 1940 at the University of Minnesota, where in 1953 he founded the Minnesota Center for Philosophy of Science, the oldest center for philosophy of science in the World. Between 1966 and 1973 he was president of the Institute of the Unity of Science.
Feigl supported a materialistic theory of mind -- the identity theory of mind -- according to which mental events are identical with states in the brain ('The mind-body problem in the development of logical positivism' in *Revue International de la Philosophie*, 4, 1950; 'The Mental and the Physical' in *Minnesota studies in the philosophy of science*, II, 1958).

Philipp Frank (Vienna 1884 - Cambridge, Mass. 1966). Physicist and philosopher of science. He studied at Gottingen with David Hilbert and Felix Klein and at Vienna, where he received (1907) his degree in physics under the direction of Ludwig Boltzmann. In the same year Hahn, Frank and Neurath began their meetings in a Viennese café, where they discussed about the new philosophy of science and epistemology -- Mach, Poincaré, Duhem. In 1912 he held the chair of theoretical physics at the German University of Prague. Frank was an editor of series *Schriften zur wissenschaftlichen Weltauffassung* and *Einheitswissenschaft*. He moved to USA in 1938 where he taught physics and philosophy of science at Harvard University. His work *Foundations of physics* was published in 1946 in the *International Encyclopedia of Unified Science*. From 1949 to 1966 he was president of the Institute of the Unity of Science. He wrote several essays on philosophy of physics: *Between physics and philosophy*, Cambridge, Mass., 1941; *Einstein: his life and time*, New York, 1953; *Relativity: a richer truth*, Boston, 1950.

Kurt Grelling (1886 - ?). Logician and philosopher. He was a victim of Nazist persecution and it is supposed that he died with his wife in Auschwitz concentration camp during 1942, although it has been also reported that Grelling was killed in 1941 at the border between France and Spain while he was trying to escape in Spain. Hempel remembers that Oppenheim made every effort to allow Grelling to immigrate in USA but -- according to Hempel -- immigration officials were perplexed by an alleged Grelling's propensity towards Communism; so there was a delay that was fatal to Grelling, who was captured in France and killed in a Polish concentration camp. The episode is reported in Hempel, 'Autobiografia intellettuale' in *Oltre il positivismo logico*, Armando : Rome, 1988 (this essay is the text of an interview Hempel gave to Richard Noland in 1982, published for the first time in Italian translation in 1988).
Grelling was a teacher in secondary school and was interested in logical problems. A semantic paradox is named after him, the Grelling's paradox, formulated in 1908 by Grelling and Leonard Nelson. There are some words which have the property they express; for example 'short' is short. Those words are called autological. The other words are called heterological; for example, 'long' is an heterological word -- it is not long. Now the question is whether 'heterological' is heterological. If yes, then 'heterological' is by definition an autological word and thus it is not heterological. If no, then 'heterological' has the property it designate and therefore it is heterological. Thus, 'heterological' is heterological if and only if it is not heterological.
Grelling collaborated with G&oumldel and in 1936 he published an article in which he defended G&oumldel's theorem of incompleteness against an erroneous interpretation, according to which G&oumldel's theorem is indeed a paradox like Russell's paradox ('Gibt es eine G&oumldelsche Antinomie?' in *Theoria*, 3, 1936). Grelling was also interested in the analysis of scientific explanation and in Gestalt approach.

Hans Hahn (Vienna 1879 - Vienna 1934). Mathematician and philosopher, co-author of the manifesto of the Vienna Circle. He received his degree in mathematics in 1902; afterwards he

studied under the direction of Boltzamm in Vienna and Hilbert, Klein, Minkowski in Gottingen. In 1905 he taught mathematics at Innsbruck and in 1909 at the University of Vienna. In 1907 Hahn, Frank and Neurath began their meetings on philosophy. Later, in 1922, they arranged to bring Schlick to the University of Vienna. After the First World War -- during which he taught in Bonn -- Hahn returned to the University of Vienna (1921). He held courses on the symbolic logic, the foundations of mathematics and Wittgenstein's *Tractatus*; one of the students who attended Hahn's courses was K. R. Popper, who found his lectures very interesting and of perfect clarity. Another his student was Kurt G&oumldel, who wrote his dissertation, in which he proved the completeness of first order logic, under Hahn's direction. Hahn was and editor of the series *Einheitswissenschaft*.

Carl Gustav Hempel (1905 - 1997). See Hempel.

Otto Neurath (Vienna 1882 - Oxford 1945). Philosopher and sociologist. He played an important role in the development of logical positivism; very active, he took part to the meetings with Frank and Hahn from 1907, arranged -- with Hahn and Frank -- to bring Schlick to the University of Vienna in 1922, was a co-author of the manifesto of the Vienna Circle (it is supposed that Neurath was indeed the principal author), planned and directed the *International Encyclopedia of Unified Science*, was an editor of the journal *Erkentnnis* and of the series *Einheitswissenchaft*, founded and directed the International Foundation for Visual Education. Neurath studied economy, sociology and philosophy at the University of Vienna and at the University of Berlin. In 1919 he was member of the government of the socialist republic of Bavaria; he was imprisoned and prosecuted, but he managed to escape in Vienna, where was director of a museum from 1924 to 1934. In that year Neurath emigrated to Holland and in 1940 he moved to England, where he died in 1945.
Neurath proposed a linguistic theory of science, according to which scientific statements are not judged by means of the empirical evidence, but they are verified with respect to all other statements: true is thus replaced with coherence.

> **When a statement is formulated, it is checked against the totality of existing statements. If it agrees with them, it is accepted; otherwise, it is marked as not true ... there is no other criterion of truth.**
> **('Physikalismus', in *Scientia*, 50, 1931).**

According to Neurath, the unity of science is attainable through the unity of language. Neurath regarded the language of physics as the only legitimate and objective language which completely avoids the problems (eg solipsism) generated by a phenomenalistic language (it is evident a criticism to the methodological solipsism Carnap used in his *Der logische Aufbau der Welte*). In the language of science there is no room for ethical terms (ethics is meaningless). But also psychological concepts are forbidden; we must substitute them with physical concepts.
Neurath also proposed an international picture language, the Isotype (*International picture language, the first rules of Isotype*, London, 1936; *Basic by Isotype*, London, 1937; *Modern man in the making*, London, 1939). This visual language was based on a combination of charts, graphics, diagrams, maps. The original project of the *International Encyclopedia* included a never realized Visual Thesaurus in several volumes written in Isotype. Now we can fully appreciate the utility of a visual representation based on graphics, icons, etc; thus we can also appreciate Neurath's prophetic intuition of an international visual language.

Hans Reichenbach (1891 - 1953). See Reichenbach.

Moritz Schlick (Berlin 1882 - Vienna 1936). Physicist and philosopher. He studied at the University of Losanna, Heidelberg and Vienna, where he received his degree in physics with a dissertation written under the direction of Max Planck. Between 1911 and 1917 he taught at the University of Rostock. In those years Schlick was interested in the theory of relativity; he wrote 'Die philosophische Bedeutung der Relativitätsprinzip' in *Zeitschrift für Philosophie und philosophische Kritik*, 159, 1915; *Raum und Zeit in der gegenwärtingen Physik*, Berlin, 1917 (English translation: *Space and time in contemporary physics*, 1920). In 1918 he published *Allgemeine Erkenntnislehre* (English translation: *General theory of knowledge*, 1974). With the help of Frank, Hahn and Neurath, in 1922 Schlick moved to the University of Vienna, where he held the chair of theory of inductive science. Schlick organized a discussion group known as the Vienna Circle. He was an editor of the series published by the Vienna Circle *Schriften zur wissenschaftlichen Weltauffassung*. In 1929 and 1932 he was Visiting Professor at Stanford University; he was the herald of the philosophy of logical positivism in USA. The American journal *Philosophical Review* hosted an interesting exchange of opinions between American philosopher C. I. Lewis and Schlick on the verifiability principle (C. I. Lewis, 'Experience and meaning', 1934; M. Schlick, 'Meaning and verification', 1936). In 1929, the manifesto of the Vienna Circle, written by Hahn, Neurath and Carnap, was dedicated to Schlick; in 1930 the first article published in the new journal *Erkenntnis* was Schlick's *Die Wende der Philosophie*.

Schlick was killed in the University of Vienna by a Nazi sympathizer student on June 22 1936. Schlick can be regarded as the father of logical positivism, both for his organizational skills and for his philosophical ideas. He formulated the verifiability principle.

According to Schlick, scientific laws are not genuine statements, for they are not completely verifiable; they are rules employed to make predictions. The only criterion for justifying scientific laws is the reliability of forecasts; causal laws express nothing but the possibility to make a prediction. Quantum physics has proved -- Schlick asserted -- that there is a limit to such a possibility. That limitation is not due to a failure of human knowledge or to an interference the human observer cause on the physical system. If quantum mechanics proves the impossibility of a simultaneous measurement of position and momentum, therefore -- according to Schlick -- simultaneous position and momentum do not exist.

Schlick criticized Neurath's linguistic theory of science. According to Schlick, science is not characterized by the internal coherence: scientific statements must be tested with respect to the given experience.

Friedrich Waismann (1896 - Oxford 1959). Philosopher. He studied mathematics and philosophy at Vienna and in 1929 became assistant to Schlick. He was one of the few members of the Vienna Circle admitted to the meetings with Wittgenstein. Waismann recorded several conversations whose text was published posthumously in F. Waismann, *Wittgenstein und der Wiener Kreis*, 1967 (English translation *Wittgenstein and the Vienna circle : conversations recorded by Friedrich Waismann*, New York : Barnes & Noble Books, 1979). Waismann proposed a logical interpretation of probability inspired by Wittgenstein in his work 'Logische Analyse des Wahrscheinlichkeitsbegriffs' (*Erkenntnis*, 1, 1930). In 1936 he published his only book *Einführung in das mathematische Denken*, about the philosophy of mathematics. He emigrated to England in 1937, where he taught philosophy of mathematics and philosophy of science at Cambridge and, from 1940, at Oxford. In England he contributed to the development of analytic philosophy. Posthumously was published *The principles of linguistic philosophy*, Oxford, 1965, an exposition to the philosophy of the late Wittgestein.

The only book he published during his life dealt with the interpretation of mathematics. Waismann criticized both logicism and formalism. Logicism argues that all mathematical truths are logical truths and it is based on Frege and Russell definition of natural numbers: a natural number is the class of all equinumerable classes. According to Waismann, this definition introduces an element of contingency in mathematics, thus disturbing its a priori character. Moreover, formal logic is by no means a privileged calculus to which all mathematics is reducible. Logic itself is a part of mathematics. Waismann also rejected the formalistic interpretation, because it is not interested with the meaning of mathematical concepts. For formalism, a natural number is whatever fulfils the axioms of mathematics. But this approach neglects a very important problem, that is the question whether the axioms of mathematics identify the natural number we really employ. The solution consists in the study of the role that natural numbers play in ordinary language (note the evident analogy with Wittgestein's assertion that meaning is use).

Peter Lombard (1095-1160)

LIFE. Peter Lombard, a scholastic theologian of the twelfth century, was commonly known as "the Lombard" after his birthplace which actually was probably Novara. It is expected that he then moved to Lombardy approximately after his birth in 1105-1110 CE He died in Paris, France about 1160 (1164). Although his family was poor, he found powerful patrons such as St. Bernard, that enabled him to gain a higher education at Bologna, then at Reims in France, and finally in Paris. In Paris, Peter taught theology in the cathedral school of Notre Dame, and it was there he found the time to produce the works discussed later in this article. Their dates can be only approximately fixed. The most famous of them, the *Libri quatuor sententiarum* , was probably composed between 1147 and 1150, although it may be placed as late as 1155. Nothing is certainly known of his later life except that be became bishop of Paris in 1159. According to Walter of St. Victor, a hostile witness, Peter obtained the office by simony; the more usual story is that Philip, younger brother of Louis VII. and archdeacon of Paris, was elected but declined in favor of Peter, his teacher. The date of his death can not be determined with certainty. The ancient epitaph in the church of St. Marcel at Paris assigns it to 1164, but the figures seem to be a later addition. The demonstrable fact that Maurice of Sully was bishop before the end of 1160 seems conclusive against it, although it is possible that in that year he resigned his see and lived three or four years longer.

THE *SENTENCES*. The historic importance of Peter Lombard rests on his *Sentences* and the position taken by them in medieval philosophy. The earlier dogmatic theologians, such as Isidore of Seville, Alcuin, and Paschasius Radbert, had attempted to establish the doctrine of the Church from Bible texts and quotations from the Fathers. In the eleventh century this method gave place to dialectical and speculative working over of the traditional dogmas. Peter Lombard came into the field at a time when the now methods and their dialectical artifices were still exposed to wide-spread objection, but when the thirst for knowledge was exceedingly keen. One text-book after another was being published, the majority of them either issuing from the school of Abelard, or in some degree inspired by him. Of these works the greatest influence was attained by that of Peter, which was, for the time, an admirable compendium of theological knowledge. It is written under the influence preeminently of Abelard, Hugo of St. Victor, and the *Decretum* of Gratian. Whether Peter had himself seen the early writers whom he cites is frequently uncertain. Peter was a man of wide reading, but the works of the Fathers had been used again and again in long catent of "sentences " which rendered it unnecessary to go to the original treatises. As to his contemporaries, whom he knew thoroughly, he shows the influence of Abelard in his whole method and in countless details, while preserving a critical attitude toward his most pronounced peculiarities. On the other hand, he follows Hugo very closely and often textually, though here also with a tendency to avoid the purely speculative elements. For his sacramental doctrine, Gratian is very useful, especially through the quotations adduced by him and his legal attitude toward these questions.

ANALYSIS OF THE *SENTENCES*. The first book of the " Sentences ", deals, principally from a

cosmological standpoint, with the evidences for the existence of God. For the doctrine of the Trinity he appeals to the analogies used since Augustine. However, he denies that any real knowledge of the doctrine can be obtained from these analogies without positive revelation and faith, and emphasizing the fact that human speech cannot give a satisfactory account of the nature of God. Joachim of Flore asserted that Peter changed the Trinity into a quaternity, and the charge was investigated at the Lateran Council of 1215. The basis of this charge was the manner in which he distinguished the divine substance from the three persons. Lombard asserted, as a realist, the substantive reality of this common substance. Joachim accused him of adding this substance to the three persons, but Innocent III. and the council decided that he was perfectly orthodox. The relation between the prescience of God and events is conceived in such a way that neither that which happens is the actual ground of the foreknowledge nor the latter of the former, but each is to the other a *causa sine qua non* . Predestination is thus, as a divine election, the preparation of grace and the foreknowledge and preparation of the blessings of God, through which man is justified. There is no such thing as merit antecedent to grace, not even in the sense that man can merit not to be cast away. The omnipotence of God consists in this, that he does what he wills and suffers nothing. A distinction is made between the absolute uncaused will of God, which is always accomplished, and what may be called his will in a loose sense. To the *signa beneplaciti* , the signs of the latter, including commands, prohibitions, counsels, operations, permissions, results do not always correspond-" for God commanded Abraham to sacrifice his son, yet did not will it to be done."

The second book of the *Sentences* deals with creation and the doctrine of the angels. Peter, following Hugo, considers the " image " and " likeness " of God as distinct, but does not decide for any of the three explanations of this distinction which he quotes. He rejects the traducianist theory of the origin of the human soul. He calls the will free, inasmuch as it " has power to desire and choose, without coercion or necessity, what it has decreed on grounds of reason," but he denies Abelard's theory that the moral character of an act depends on the will of the doer. Of some importance is the strong emphasis laid upon the actually sinful character of the nature derived from Adam, in conjunction with the condemnation of Abelard's proposition that " we inherit from Adam not guilt but penalty." In regard to grace he shows some independent thought, which had its influence on later teaching. Grace (*gratia operans*) is a power (*virtus*) which frees and heals the will, enabling it to perform good and meritorious works. Of grace and the will, grace is the more important. The third book deals with Christology, reproducing the traditional orthodox conceptions, but showing some influence from Abelard. One portion of this discussion brought him into suspicion of Nihilianism. He was accused by John of Cornwall and Walter of St. Victor, and more than one council took up the question without reaching a conclusion. The charge of Nestorianisn, which Gerhoh of Reichersberg brought against the Christology of his time, was made also against the Lombard. In regard to the atonement, he endeavored both to follow out the accepted system of his day and to make use of suggestions from Abelard. Christ merited glorification by his life, and by his death man's entrance into Paradise, his liberation from sin and its penalty and from the power of the devil. Christ as man is a perfect and sufficient sacrifice to achieve reconciliation, through the revelation of God's love made in his death; " the death of Christ then justifies us, when by it love is awakened in our hearts." Further, Christ sets man free from eternal punishment *relaxando debitum*; but to set man free from the temporal punishment, which is remitted in baptism and mitigated by penance, " the penances laid upon those who repent by the Church would not suffice unless the penalty borne by Christ were added to release us."

There is a lack of clearness about this whole subject; the ideas of Abelard (Anselm is not noticed) show themselves now and again through all the effort to preserve the objective notion of the work of redemption.

The fourth book deals with the sacraments. Here Peter follows Hugo and the *Decretum* of Gratian; and his teaching was of great significance for the later development. He was probably the first to make a distinct classification of seven and only seven sacraments; he laid down the dogmatic questions to be discussed under the head of each, and he introduced matter from church law into his discussion of the sacramental dogma. In regard to the Eucharist, he speaks of the " conversion " of one substance into the other, without defining any further, and denies both the symbolic view and the consubstantiation taught by some followers of Berengar. In his doctrine of penance he follows Abelard in seeking theoretical justification for the change which by this time had taken place in the practice.

In spite of the cautious objectivity of the whole treatment, some of the propositions laid down in the "Sentences " were considered erroneous in after years. Walter of St. Victor asserts that at the Lateran council of 1179 it was proposed to condemn the *Sentences* but other matters prevented a discussion of the proposal. From the middle of the thirteenth century the University of Paris refused its assent to eight propositions, of a highly technical character, it is true, and Bonaventure declined to press them. Others were afterward added; but these objections did not interfere with the general popularity of the work, which had increased to such an extent by Roger Bacon's time (1267) that he could complain that lectures on it had forced those on Scriptural subjects into the background. Besides the " Sentences," other extant works of Peter Lombard are Commentarius in psalmos Davidicos and Collectanea in omnes D. Paitli epistolas both collections, in the manner of medieval Catenae, of quotations from patristic and early medieval theologians, with occasional independent remarks. A few unpublished manuscripts, some of them of doubtful authenticity, remain in various places. Of these the most important for a complete knowledge of the author are two manuscripts, one early thirteenth century, the other fourteenth, in the Bibliotheque Nationale at Paris, containing twenty-five festival sermons representing. a moderate type of medieval mystical theology, dominated by allegorical exegesis, but making some excellent practical points.

Rudolf Hermann Lotze (1817-1881)

German philosopher; born at Bautzen (31 m. e.n.e. of Dresden), Saxony, May 21, 1817; died at Berlin July 1, 1881. He studied philosophy and medicine at the University of Leipsic, taking degrees in both subjects, and became extraordinary professor of philosophy there in 1842. He was called to Gottingenin 1844, and to Berlin in 1881, but here he was able to lecture only a part of one semester. Lotze was one of the most influential philosophers of the second half of the nineteenth century, and he has man followers, particularly among theologians. This is explained by the fact that in his speculation ethical and religious needs come into their full rights. His philosophy represents a reaction against the ideological pantheism of Hegel, which seemed to sacrifice all individuality and variety in existence to a formal and abstract scheme of development. Lotze characterized his philosophical standpoint as teleological idealism, and he regarded ethics as the starting-point of metaphysics. While enforcing the mechanical view of nature, he sought to show that mechanism, the relation of cause and effect, is incomprehensible, except as the realization of a world of moral ideas. Thus, each causal series becomes at the same time a teleological series. Lotze worked out this reconciliation of mechanism and teleology by combining with the monads of Leibniz the absolute substance of Spinoza, in which individual things (monads) are grounded, and through whose all-inclusive unity interrelation is possible. Some of Lotze's more important works are: *Metaphysik* (Leipsic, 1841); *Logik* (1843); *Medizinische Psychologie oder Physiologie der Seele* (1852); *Mikrokosmus. Ideen zur Naturge8chichte und Geschichte der Menschheit* (3 vols., 185"4; Eng. transl., 2 vols., Edinburgh, 1885), his principal work; *Geschichte der Aesthetik in Deutschland* (Munich, 1868); and the unfinished *System der Philosophie* (vol. i., *Logik*, Leipsic, 1874; vol. ii., *Metaphysik*, 1879; Eng. transl. of both, 2 parts, Oxford, 1884). After Lotze's death appeared *Diktate*, notes from his lectures on the various philosophical disciplines (8 parts, Leipsic, 1882-84; Eng. transl. by G. T. Ladd, *Outline*, 6 vols., Boston, 1884-1887); also *Kleine Schriften* (3 vols., Leipsic, 1885-1894).

Philosophy of Love

Philosophy of Love: Introduction

The philosophical treatment of love transcends a variety of sub-disciplines including epistemology, metaphysics, religion, human nature, politics and ethics. Often statements or arguments concerning love, its nature and role in human life for example, connect to one or all the central theories of philosophy, and is often compared with, or examined in the context of, the philosophies of sex and gender. The task of a philosophy of love is to present the appropriate issues in a cogent manner, drawing on relevant theories of human nature, desire, ethics, and so on. This brief introduction examines the nature of love and some of the ethical and political ramifications.

The Nature of Love: *Eros*, *Philia, and Agape*.

The philosophical discussion regarding love logically begins with questions concerning its nature. This implies that love has a 'nature', a proposition that some may oppose arguing that love is conceptually irrational, in the sense that it cannot be described in rational or meaningful propositions. For such critics, who are presenting a metaphysical and epistemological argument, love may be an ejection of emotions that defy rational examination; on the other hand, some languages, such as Papuan do not even admit the concept, which negates the possibility of a philosophical examination. In English, the word 'love', which is derived from Germanic forms of the Sanskrit *lubh* (desire), is broadly defined and hence imprecise, which generates first order problems of definition and meaning, which are resolved to some extent by the reference to the Greek terms, *eros*, *philia*, and *agape*.

Eros

The term *eros* (Greek *erasthai*) is used to refer to that part of love constituting a passionate, intense desire for something, it is often referred to as a sexual desire, hence the modern notion of 'erotic' (Greek *erotikos*). In Plato's writings however, *eros* is held to be a common desire that seeks transcendental beauty-the particular beauty of an individual reminds us of true beauty that exists in the world of Forms or Ideas (*Phaedrus* 249E: "he who loves the beautiful is called a lover because he partakes of it." Trans. Jowett). The Platonic-Socratic position maintains that the love we generate for beauty on this earth can never be truly satisfied until we die; but in the meantime we should aspire beyond the particular stimulating image in front of us to the contemplation of beauty in itself.

The implication of the Platonic theory of *eros* is that ideal beauty, which is reflected in the particular images of beauty we find, becomes interchangeable across people and things, ideas, and art: to love is to love the Platonic form of beauty-not a particular individual, but the element they posses of true (Ideal) beauty. Reciprocity is not necessary to Plato's view of love, for the desire is for the object (of Beauty),

than for, say, the company of another and shared values and pursuits.

Many in the Platonic vein of philosophy hold that love is an intrinsically higher value than appetitive or physical desire. Physical desire, they note, is held in common with the animal kingdom and hence of a lower order of reaction and stimulus than a rationally induced love, i.e., a love produced by rational discourse and exploration of ideas, which in turn defines the pursuit of Ideal beauty. Accordingly, the physical love of an object, an idea, or a person in itself is not be a proper form of love, love being a reflection of that part of the object, idea, or person, that partakes in Ideal beauty.

Philia

In contrast to the desiring and passionate yearning of *eros*, *philia* entails a fondness and appreciation of the other. For the Greeks, the term *philia* incorporated not just friendship, but also loyalties to family and *polis*-one's political community, job, or discipline. *Philia* for another may be motivated, as Aristotle explains in the *Nicomachean Ethics*, Book VIII, for the agent's sake or for the other's own sake. The motivational distinctions are derived from love for another because the friendship is wholly useful as in the case of business contacts, or because their character and values are pleasing (with the implication that if those attractive habits change, so too does the friendship), or for the other in who they are in themselves, regardless of one's interests in the matter. The English concept of friendship roughly captures Aristotle's notion of *philia*, as he writes: "things that cause friendship are: doing kindnesses; doing them unasked; and not proclaiming the fact when they are done…" (*Rhetoric*, II. 4, trans. Rhys Roberts).

Aristotle elaborates on the kinds of things we seek in proper friendship, suggesting that the proper basis for *philia* is objective: those who share our dispositions, who bear no grudges, who seek what we do, who are temperate, and just, who admire us appropriately as we admire them, and so on. *Philia* could not emanate from those who are quarrelsome, gossips, aggressive in manner and personality, who are unjust, and so on. The best characters, it follows, may produce the best kind of friendship and hence love: indeed, how to be a good character worthy of *philia* is the theme of the *Nicomachaen Ethics*. The most rational man is he who would be the happiest, and he, therefore, who is capable of the best form of friendship, which between two "who are good, and alike in virtue" is rare (*NE*, VIII.4 trans. Ross). We can surmise that love between such equals-Aristotle's rational and happy men-would be perfect, with circles of diminishing quality for those who are morally removed from the best. He characterizes such love as "a sort of excess of feeling". (*NE*, VIII.6)

Friendships of a lesser quality may also be based on the pleasure or utility that is derived from another's company. A business friendship is based on utility--on mutual reciprocity of similar business interests; once the business is at an end, then the friendship dissolves. Similarly with those friendships based on the pleasure that is derived from the other's company, which is not a pleasure enjoyed for who the other person is in himself, but in the flow of pleasure from his actions or humour.

The first condition for the highest form Aristotelian love is that a man loves himself. Without an egoistic basis, he cannot extend sympathy and affection to others (*NE*, IX.8). Such self-love is not hedonistic, or glorified, depending on the pursuit of immediate pleasures or the adulation of the crowd, it is instead a reflection of his pursuit of the noble and virtuous, which culminate in the pursuit of the reflective life. Friendship with others is required "since his purpose is to contemplate worthy actions…to live pleasantly…sharing in discussion and thought" as is appropriate for the virtuous man and his friend (*NE*, IX.9). The morally virtuous man deserves in turn the love of those below him; he is not obliged to give an equal love in return, which implies that the Aristotelian concept of love is elitist or perfectionist: "In

all friendships implying inequality the love also should be proportional, i.e. the better should be more loved than he loves." (*NE*, VIII, 7,). Reciprocity, although not necessarily equal, is a condition of Aristotelian love and friendship, although parental love can involve a one-sided fondness.

Agape

Agape refers to the paternal love of God for man and for man for God but is extended to include a brotherly love for all humanity. (The Hebrew *ahev* has a slightly wider semantic range than *agape*). *Agape* arguably draws on elements from both *eros* and *philia* in that it seeks a perfect kind of love that is at once a fondness, a transcending of the particular, and a passion without the necessity of reciprocity. The concept is expanded on in the Judaic-Christian tradition of loving God: "You shall love the Lord your God with all your heart, and with all your soul, and with all your might" (Deuteronomy 6:5) and loving "thy neighbour as thyself" (Leviticus 19:18). The love of God requires absolute devotion that is reminiscent of Plato's love of Beauty (and Christian translators of Plato such as St Augustine employed the connections), which involves an *erotic* passion, awe, and desire that transcends earthly cares and obstacles. Aquinas, on the other hand, picked up on the Aristotelian theories of friendship and love to proclaim God as the most rational being and hence the most deserving of one's love, respect, and considerations.

The universalist command to "love thy neighbor as thyself" refers the subject to those surrounding him, whom he should love unilaterally if necessary. The command employs the logic of mutual reciprocity, and hints at an Aristotelian basis that the subject should love himself in some appropriate manner: for awkward results would ensue if he loved himself in a particularly inappropriate, perverted manner! (Philosophers can debate the nature of 'self-love' implied in this-from the Aristotelian notion that self-love is necessary for any kind of inter-personal love, to the condemnation of egoism and the impoverished examples that pride and self-glorification from which to base one's love of another. St Augustine relinquishes the debate--he claims that no command is needed for a man to love himself (*De bono viduitatis*, xxi.) Analogous to the logic of "it is better to give than to receive", the universalism of *agape* requires an initial invocation from someone: in a reversal of the Aristotelian position, the onus for the Christian is on the morally superior to extend love to others. Nonetheless, the command also entails an egalitarian love-hence the Christian code to "love thy enemies" (Matthew 5:44-45). Such love transcends any perfectionist or aristocratic notions that some are (or should be) more loveable than others. *Agape* finds echoes in the ethics of Kant and Kierkegaard, who assert the moral importance of giving impartial respect or love to another person *qua* human being in the abstract.

However, loving one's neighbor impartially (James 2:9) invokes serious ethical concerns, especially if the neighbor ostensibly does not warrant love. Debate thus begins on what elements of a neighbor's conduct should be included in *agape*, and which should be excluded. Early Christians asked whether the principle applied only to disciples of Christ or to all. The impartialists won the debate asserting that the neighbor's humanity provides the primary condition of being loved; nonetheless his actions may require a second order of criticisms, for the logic of brotherly love implies that it is a moral improvement on brotherly hate. For metaphysical dualists, loving the soul rather than the neighbor's body or deeds provides a useful escape clause-or in turn the justification for penalizing the other's body for sin and moral transgressions, while releasing the proper object of love-the soul-from its secular torments. For Christian pacifists, "turning the other cheek" to aggression and violence implies a hope that the aggressor will eventually learn to comprehend the higher values of peace, forgiveness, and a love for humanity.

The universalism of *agape* runs counter to the partialism of Aristotle and poses a variety of ethical implications. Aquinas admits a partialism in love towards those we are related while maintaining that we should be charitable to all, whereas others such as Kierkegaard insist on impartiality. Recently, LaFallotte has noted that to love those one is partial towards is not necessarily a negation of the impartiality principle, for impartialism could admit loving those closer to one as an impartial principle, and, employing Aristotle's conception of self-love, iterates that loving others requires an intimacy that can only be gained from being partially intimate ("Personal Relations", *Blackwell Companion to Ethics*). Others would claim that the concept of universal love, of loving all equally, is not only impracticable, but logically empty-Aristotle, for example, argues: "One cannot be a friend to many people in the sense of having friendship of the perfect type with them, just as one cannot be in love with many people at once (for love is a sort of excess of feeling, and it is the nature of such only to be felt towards one person)" (*NE*, VIII.6).

The Nature of Love: further conceptual considerations.

Presuming love has a nature, it should be, to some extent at least, describable within the concepts of language. But what is meant by an appropriate language of description may be as philosophically beguiling as love itself. Such considerations invoke the philosophy of language, of the relevance and appropriateness of meanings, but they also provide the analysis of 'love' with its first principles. Does it exist and if so, is it knowable, comprehensible, and describable? Love may be knowable and comprehensible to others, as understood in the phrases, "I am in love", "I love you", but what 'love' means in these sentences may not be analyzed further: that is, the concept 'love' is irreducible-an axiomatic, or self-evident, state of affairs that warrants no further intellectual intrusion, an apodictic category perhaps, that a Kantian may recognize.

The epistemology of love asks how we may know love, how we may understand it, whether it is possible or plausible to make statements about others or ourselves being in love (which touches on the philosophical issue of private knowledge versus public behavior). Again, the epistemology of love is intimately connected to the philosophy of language and theories of the emotions. If love is purely an emotional condition, it is plausible to argue that it remains a private phenomenon incapable of being accessed by others, except through an expression of language, and language may be a poor indicator of an emotional state both for the listener and the subject. Emotivists would hold that a statement such as "I am in love" is irreducible to other statements because it is a nonpropositional utterance, hence its veracity is beyond examination. Phenomenologists may similarly present love as a non-cognitive phenomenon. Scheler, for example, toys with Plato's Ideal love, which is cognitive, claiming: "love itself…bringing about the continuous emergence of ever-higher value in the object--just as if it were streaming out from the object of its own accord, without any exertion (even of wishing) on the part of the lover. (*The Nature of Sympathy*, trans. Heath). The lover is passive before the beloved.

The claim that 'love' cannot be examined is different from that claiming 'love' *should* not be subject to examination-that it should be put or left beyond the mind's reach, out of a dutiful respect for its mysteriousness, its awesome, divine, or romantic nature. But if it is agreed that there is such a thing as 'love' conceptually speaking, when people present statements concerning love, or admonitions such as "she should show more love", then a philosophical examination seems appropriate: is it synonymous with certain patterns of behavior, of inflections in the voice or manner, or by the apparent pursuit and

protection of a particular value ("Look at how he dotes upon his flowers-he must love them")?

If love does possesses 'a nature' which is identifiable by some means-a personal expression, a discernible pattern of behavior, or other activity, it can still be asked whether that nature can be *properly* understood by humanity. Love may have a nature, yet we may not possess the proper intellectual capacity to understand it-accordingly, we may gain glimpses perhaps of its essence-as Socrates argues in *The Symposium*, but its true nature being forever beyond humanity's intellectual grasp. Accordingly, love may be partially described, or hinted at, in a dialectic or analytical exposition of the concept but never understood in itself. Love may therefore become an epiphenomenal entity, generated by human action in loving, but never grasped by the mind or language. Love may be so described as a Platonic Form, belonging to the higher realm of transcendental concepts that mortals can barely conceive of in their purity, catching only glimpses of the Forms' conceptual shadows that logic and reason unveil or disclose.

Another view, again derived from Platonic philosophy, may permit love to be understood by certain people and not others. This invokes a hierarchical epistemology, that only the initiated, the experienced, the philosophical, or the poetical or musical, may gain insights into its nature. On one level this admits that only the experienced can know its nature, which is putatively true of any experience, but it also may imply a social division of understanding-that only philosopher kings may know true love. On the first implication, those who do not feel or experience love are incapable (unless initiated through rite, dialectical philosophy, artistic processes, and so on) of comprehending its nature, whereas the second implication suggests (though this is not a logically necessary inference) that the non-initiated, or those incapable of understanding, feel only physical desire and not 'love'. Accordingly, 'love' belongs either to the higher faculties of all, understanding of which requires being educated in some manner or form, or it belongs to the higher echelons of society-to a priestly, philosophical, or artistic, poetic class. The uninitiated, the incapable, or the young and inexperienced-those who are not romantic troubadours-are doomed only to feel physical desire. This separating of love from physical desire has further implications concerning the nature of romantic love.

The Nature of Love: Romantic Love

Romantic love is deemed to be of a higher metaphysical and ethical status than sexual or physical attractiveness alone. The idea of romantic love initially stems from the Platonic tradition that love is a desire for beauty-a value that transcends the particularities of the physical body. For Plato, the love of beauty culminates in the love of philosophy, the subject that pursues the highest capacity of men's thinking. The romantic love of knights and damsels emerged in the early medieval ages (11th Century France, *fine amour*) a philosophical echo of both Platonic and Aristotelian love and literally a derivative of the Roman poet, Ovid and his *Ars Amatoria*. Romantic love theoretically was not to be consummated, for such love was transcendental motivated by a deep respect for the lady; however, it was to be actively pursued in chivalric deeds rather than contemplated-which is in contrast to Ovid's persistent sensual pursuit of conquests!

Modern romantic love returns to Aristotle's version of the special love two people find in each other's virtues-one soul and two bodies, as he poetically puts it. It is deemed to be of a higher status, ethically, aesthetically, and even metaphysically than the love that behaviourists or physicalists describe.

The Nature of Love: Physical, emotional, spiritual

Some may hold that love *is* physical, i.e., that love is nothing but a physical response to another whom the agent feels physically attracted to. Accordingly, the action of loving encompasses a broad range of behaviour including caring, listening, attending to, preferring to others, and so on. (This would be proposed by behaviourists). Others (physicalists, geneticists) reduce all examinations of love to the physical motivation of the sexual impulse-the simple sexual instinct that is shared with all complex living entities, which may, in humans, be directed consciously, sub-consciously or pre-rationally toward a potential mate or object of sexual gratification.

Physical determinists, those who believe the world to entirely physical and that every event has a prior (physical cause), consider love to be an extension of the chemical-biological constituents of the human creature and be explicable according to such processes. In this vein, geneticists may invoke the theory that the genes (an individual's DNA) form the determining criteria in any sexual or putative romantic choice, especially in choosing a mate. However, a problem for those who claim that love is reducible to the physical attractiveness of a potential mate, or to the blood ties of family and kin which forge bonds of filial love, is that it does not capture the affections between those who cannot or wish not to reproduce-that is, physicalism or determinism ignores the possibility of romantic, ideational love-it may explain *eros*, but not *philia* or *agape*.

Behaviourism, which stems from the theory of the mind and asserts a rejection of Cartesian dualism between mind and body, entails that love is a series of actions and preferences which is thereby observable to oneself and others. The behaviourist theory that love is observable (according to the recognisable behavioural constraints corresponding to acts of love) suggests also that it is theoretically quantifiable: that A acts in a certain way (actions X,Y,Z) around B, more so than he does around C, suggests that he 'loves' B more than C. The problem with the behaviourist vision of love is that it is susceptible to the poignant criticism that a person's actions need not express their inner state or emotions-A may be a very good actor. Radical behaviourists, such as B F Skinner, claim that observable and unobservable behaviour such as mental states can be examined from the behaviourist framework, in terms of the laws of conditioning. On this view, that one falls in love may go unrecognised by the casual observer, but the act of being in love can be examined by what events or conditions led to the agent's believing she was in love: this may include the theory that being in love is an overtly strong reaction to a set of highly positive conditions in the behaviour or presence of another.

Expressionist love is similar to behaviourism in that love is considered an expression of a state of affairs towards a beloved, which may be communicated through language (words, poetry, music) or behaviour (bringing flowers, giving up a kidney, diving into the proverbial burning building), but which is a reflection of an internal, emotional state, rather than an exhibition of physical responses to stimuli. Others in this vein may claim love to be a spiritual response, the recognition of a soul that completes one's own soul, or complements or augments it. The spiritualist vision of love incorporates mystical as well as traditional romantic notions of love, but rejects the behaviorist or physicalist explanations.

Those who consider love to be an aesthetic response would hold that love is knowable through the emotional and conscious feeling it provokes yet which cannot perhaps be captured in rational or descriptive language: it is instead to be captured, as far as that is possible, by metaphor or by music.

Love: Ethics and Politics.

The ethical aspects in love involve the moral appropriateness of loving, and the forms it should or should not take. The subject area raises such questions as: is it ethically acceptable to love an object, or to love oneself? Is love to oneself or to another a duty? Should the ethically minded person aim to love all people equally? Is partial love morally acceptable or permissible (i.e., not right, but excusable)? Should love only involve those with whom the agent can have a meaningful relationship? Should love aim to transcend sexual desire or physical appearances? May notions of romantic, sexual love apply to same sex couples? Some of the subject area naturally spills into the ethics of sex, which deals with the appropriateness of sexual activity, reproduction, hetero and homosexual activity, and so on.

In the area of political philosophy, love can be studied from a variety of perspectives. For example, some may see love as an instantiation of social dominance by one group (males) over another (females), in which the socially constructed language and etiquette of love is designed to empower men and disempower women. On this theory, love is a product of patriarchy, and acts analogously to Marx's view of religion (the opiate of the people) that love is the opiate of women. The implication is that were they to shrug off the language and notions of 'love', 'being in love', 'loving someone', and so on, they would be empowered. The theory is often attractive to feminists and marxists, who view social relations (and the entire panoply of culture, language, politics, institutions) as reflecting deeper social structures that divide people into classes, sexes, and races.

This article has touched on some of the main elements of the philosophy of love. It reaches into many philosophical fields, notably theories of human nature, the self, and of the mind. The language of love, as it is found in other languages as well as in English, is similarly broad and deserves more attention.

Lucretius (98-55 BCE.)

Titus Lucretius Carus was a Roman poet and philosopher who was born probably in BC 98 or 96; the year is uncertain. Of his birthplace and parentage nothing is known. Jerome is authority for the statement that he was made insane by a love-philter, and finally committed suicide, having composed some books in the intervals of his madness. According to Donatus, he died on the same day that Vergil assumed the *toga virilis* -- October 15, BC 55. His writings, however, possesses a unity and continuity inconsistent with the tradition that it was composed "in lucid intervals." It is possible, though, that the story of the poet's insanity and self-destruction may reflect some tragic event of his life. The legend of the madness of Lucretius was elaborated by Tennyson in a well-known poem.

Lucretius left one work, the *De Rerum Natura*, a didactic poem in six books containing nearly 7,500 hexameter lines. The purpose of the poem is to set forth the Epicurean system of philosophy, particularly those portions dealing with the origin of the world and the operations of natural forces. The poet's aim in writing was, as he tells us, to free men's minds from the baneful influence of superstition and of the belief in the hereafter, to which he attributed the greater portion of the fears and troubles of life. He tried to explain how, without the direction or intervention of supernatural agencies in any degree, all natural phenomena may be accounted for. In Book I, he lays down as fundamental truths the propositions that nothing can come from nothing, and that to nothing no one returns. The universe is made up of matter and void, or space. It has no center; for matter exists in infinite quantity, and space is without limit. Matter is composed of atoms, which are inconceivably minute, perfectly solid, and indestructible. Book II is devoted to an elaborate discussion of the atoms, treating their movements, shapes, and combinations. Sensation and feeling are declared to be an accident of atomic combination, a result of the coming together of atoms of certain shapes in certain ways.

The subject of the third book is the mind and soul, which, according to the poet, are inseparably united and of material nature, being composed of the finest and roundest atoms. He offers several proofs that the soul perishes at the same time with the body. Book IV deals with the phenomena of sense-perception. From the surface of all objects, thin films of matter are continually flying off, preserving the general outline of that from which they come. These impinge upon our senses, and perception is an immediate result. Yet in the adaptation of the senses to their functions, there is no evidence of design, no sign of creative intelligence. The fifth book sets forth the perishable nature of the world, its formation from a fortuitous concourse of atoms, the origin of life by spontaneous generation, the preservation of animal life in accordance with the law of the survival of the fittest, and the development of man in civilization out of a condition of brutish savagery. In Book VI, the poet attempts to explain the natural phenomena which seem most terrible and inexplicable, particularly thunder and lighting, earthquakes, volcanic eruptions, the changes of the Nile, and the power of the magnet. The poem ends abruptly with a description of the plague at Athens, and was evidently given to the world before it had received the final recession of the author.

In the matter of the poem, Lucretius followed closely the teachings of Epicurus, whom he revered as guide and master. With a truly Roman spirit, he laid more emphasis upon the region of law in the universe than his teacher; but he made no contribution in the way of doctrine to the Epicurean system. Whether he intended to bring his work to a close with a presentation of the ethical views of Epicurus it is impossible to determine; but numerous references show that in these, also, the poet was fully in sympathy with his master. The form of the *De Rerum Natura* was perhaps suggested by that of the poem of Empedocles, *On Nature*. The thought and manner of expression reveal the influence of several Greek poets besides Empedocles (notably Homer and Euripides), and of the early Roman poets (particularly Eunius), as well as of Cicero's *Aratea*. Yet the poem throughout bears the stamp of a marked individuality. Believing deeply himself in the mission of Epicureanism as a cure-all for human ills, Lucretius proclaimed its teachings with an almost religious fervor. Previous to his time, this system of philosophy had received only scanty treatment in Latin, that, too, in barbarous prose. From the multitude of its technical details and the absence of a supernatural element, it seemed incapable of poetic handling. Nevertheless, Lucretius succeeded not only in presenting the main features of Epicurean physics and psychology with admirable clearness, but even in clothing them with a highly poetic form. There are, indeed, passages of unequal merit, and now and then the lack of the poet's finishing touches becomes unpleasantly apparent; yet from beginning to end, the poem carries the reader along with a kind of epic movement and interest.

The existing manuscripts of Lucretius are all derived from a single archetype, which has long since disappeared. From this at least three copies were made. One of these, a beautiful folio of the ninth century, is now at Leyden (called A by Munro). Another was the parent of the quarto MS. of the tenth century (B), also at Leyden, and of two others of which there are considerable fragments at Copenhagen and Vienna. The third copy was taken by Poggio to Italy in the fifteenth century, and became the ancestor of the numerous Italian MSS. Of the *De Rerum Natura*.

Nicolo Machiavelli (1469-1527)

The first great political philosopher of the Renaissance was Nicolo Machiavelli (1469-1527). His famous treatise, The Prince, stands apart from all other political writings of the period insofar as it focus on the practical problems a monarch faces in staying in power, rather than more speculative issues explaining the foundation of political authority. As such, it is an expression of realpolitik, that is, governmental policy based on retaining power rather than pursuing ideals.

LIFE. Machiavelli was born in Florence, Italy at a time when the country was in political upheaval . Italy was divided between four dominant city-states, and each of these was continually at the mercy of the stronger foreign governments of Europe. Since 1434 Florence was ruled by the wealthy Medici family. Their rule was temporarily interrupted by a reform movement, begun in 1494, in which the young Machiavelli became an important diplomat. When the Medici family regained power in 1512 with the help of Spanish troops, Machiavelli was tortured and removed from public life. For the next 10 years he devoted himself to writing history, political philosophy, and even plays. He ultimately gained favor with the Medici family and was called back to public duty for the last two years of his life. Machiavelli's greatest work is The Prince, written in 1513 and published after his death in 1532. The work immediately provoked controversy and was soon condemned by Pope Clement VIII. Its main theme is that princes should retain absolute control of their territories, and they should use any means of expediency to accomplish this end, including deceit. Scholars struggle over interpreting Machiavelli's precise point. In several section Machiavelli praises Caesar Borgia, a Spanish aristocrat who became a notorious and much despised tyrant of the Romagna region of northern Italy. During Machiavelli's early years as a diplomat, he was in contact with Borgia and witnessed Borgia's rule first hand. Does Machiavelli hold up Borgia as the model prince? Some readers initially saw The Prince as a satire on absolute rulers such as Borgia, which showed the repugnance of arbitrary power (thereby implying the importance of liberty). However, this theory fell apart when, in 1810, a letter by Machiavelli was discovered in which he reveals that he wrote The Prince to endear himself to the ruling Medici family in Florence. To liberate Italy from the influence of foreign governments, Machiavelli explains that strong indigenous governments are important, even if they are absolutist.

THE PRINCE. Machiavelli opens *The Prince* describing the two principal types of governments: monarchies and republics. His focus in The Prince is on monarchies. The most controversial aspects of Machiavelli's analysis emerge in the middle chapters of his work. In Chapter 15 he proposes to describe the truth about surviving as a monarch, rather than recommending lofty moral ideals. He describes those virtues which, on face value, we think a prince should possess. He concludes that some "virtues" will lead to a prince's destruction, whereas some "vices" allow him to survive. Indeed, the virtues which we commonly praise in people might lead to his downfall. In chapter 16 he notes that we commonly think that it is best for a prince to have a reputation of being generous. However, if his generosity is done in secret, no one will know about it and he will be thought to be greedy. If it is done openly, then he risks going broke to maintain his reputation.

He will then extort more money from his subjects and thus be hated. For Machiavelli, it is best for a prince to have a reputation for being stingy. Machiavelli anticipates examples one might give of generous monarchs who have been successful. He concludes that generosity should only be shown to soldiers with goods taken from a pillaged enemy city. In Chapter 17 he argues that it is better for a prince to be severe when punishing people rather than merciful. Severity through death sentences affects only a few, but it deters crimes which affects many. Further, he argues, it is better to be feared than to be loved. However, the prince should avoid being hated, which he can easily accomplish by not confiscating the property of his subjects: "people more quickly forget the death of their father than the loss of their inheritance." In Chapter 18, perhaps the most controversial section of The Prince, Machiavelli argues that the prince should know how to be deceitful when it suits his purpose. When the prince needs to be deceitful, though, he must not appear that way. Indeed he must always exhibit five virtues in particular: mercy, honesty, humaneness, uprightness, and religiousness. In Chapter 19 Machiavelli argues that the prince must avoid doing things which will cause him to be hated. This is accomplished by not confiscating property, and not appearing greedy or wishy-washy. In fact, the best way to avoid being overthrown is to avoid being hated.

Nicholas Malebranche (1638-1715)

LIFE. The most influential and original of the Cartesian philosophers was Nicholas Malebranche (1638-1715). Deformed and sickly, Malebranche was born in Paris and from his childhood preferred solitude. He studied theology at the Sorbonne, and at age 22 entered the Congregation of the Oratory where he spent the rest of his life in seclusion. He was ordained in 1664 and the same year became acquainted with Descartes' Treatise on Man, an unfinished work which explores the relation between the human mind and body. He subsequently devoted his studies to Cartesian philosophy and science and four years later published his greatest work, *The Search After Truth* (*De la Recherche de la vérité,* 3 vol. 1674-1675). In response to theological criticisms of this work he soon after published his *Treatise of Nature and Grace* (*Traité de la nature et de la grâce,* 1680) which attempts to reconcile God's power, knowledge, and goodness with the evil in the world. This work embroiled him in even more controversy, particularly with French Bishop Jacques Bénigne Bossuet and French theologian Antoine Arnauld. Malebranche's other philosophical writings include *Dialogues on Metaphysics and on Religion* (*Entretiens sur la métaphysique et sur la religion,* 1688), a work in fourteen dialogs which more informally covers much of the ground in his *Search after Truth,* and *A Treatise of Morality* (*Traité de morale,* 1683). In 1699 he was elected to the Académie des Sciences for his scientific writings. Near the end of his life, similarities between his views of God and those of Spinoza led to accusations that he followed Spinoza's heretical system. He defended himself against these charges in various letters and writings.

Two aspects of Malebranche's philosophy have been especially influential in the history of philosophy: (1) that we see all things through God, and (2) occasionalism. Both of these doctrines are discussed below. As to the first of these, Malebranche was concerned with explaining how our minds get perceptual images of external objects. His final answer to the question is that, within himself, God contains images of all external things, and God implants these ideas in our mind at the appropriate time. Thus, we see external objects by viewing their images as they reside in God.

ALTERNATIVE THEORIES OF HOW WE SEE THINGS. Malebranche's principal discussion of his notion of seeing all things through God occurs in *The Search after Truth,* Book 3, part. 2, chapters 1-6. He begins by setting out the problem he wishes to address, namely, the notion of "idea." We do not have direct access to the external objects, but only have ideas (or perceptions) which presumably resemble those objects. He defines "idea" as "the immediate object, or the nearest thing to the mind when it perceives anything." A central problem in modern philosophy concerned the connection between our perceptions and the external objects which supposedly produce our perceptions. For example, if I perceive a red ball in front of me, I may be tempted to assume that the object in front of me has exactly the properties as I perceive them (such as a particular shade of red). This view is called *direct realism,* and Malebranche immediately dismisses this theory. Instead, for Malebranche, ideas in some way represent the object in question. This view is called *representative realism.* Accordingly, when Malebranche uses the word "idea" he restricts its meaning to mental perceptions which represent or copy some original thing.

Malebranche divides mental perceptions into the following groups:

```
                                  Internal
        Mental Perceptions <                         Spiritual
                                  External <
                                                     Material
```

Mental perceptions in general are either internally produced or externally produced. Our internal mental perceptions (such as emotions) are not themselves ideas, since they do not copy or represent anything (unlike our idea-perceptions of external objects which in fact represent those objects). Properly speaking, then, ideas constitute our externally produced mental perceptions. Even here, though, there is an exception. Malebranche sees that some mental perceptions may be produced from an external spiritual source, such as telepathy, and thus do not represent or copy anything. At least in theory, some mental perceptions may be directly caused by an external spiritual source and would not involve any representative ideas. Malebranche's principal concern, though, is with mental perceptions caused by an external material source. These, he argues, necessarily are given to us as ideas which represent or copy the original object.

Let us grant Malebranche's initial point that the ideas of external things are only representations or copied images of the original object in question. The next question for Malebranche, then, is how we acquire these copied images of the original. Malebranche considers five possible theories of how represented ideas are fed to us. Through a process of elimination he concludes that we receive these ideas of external things from God who discloses them to us as he sees fit. The first possibility considered by Malebranche is that ideas of objects are fed to us by the objects themselves. He considers this theory as explained by Medieval philosophers who followed Aristotle, namely, the theory of emitted species. On this view, some kind of species or sense data particles are emitted by objects which carry the object's image to our senses. Malebranche rejects this view for three reasons. The first problem with this view is that the species particles themselves must be physical. However, at the same time, we must concede that they all are reduced to the size of a tiny (perhaps infinitely small) point. This is because at any point in space, we can see an infinite number of objects. The second problem with this view is that the same object produces species of different sizes depending on how close we are to the object. This is particularly problematic since it is difficult to conceive how this can be done in any single instant of time. The third problem is that the same species must be emitted by the different objects, yet we perceive them differently. Explain Malebranche's examples comparing a the side of a real cube with a picture of a parallelogram.

The second theory which Malebranche attacks is that objects make some kind of impression on our senses, and from these impressions we by ourselves form the ideas which represent the object. Since, on this theory, the initial impression does not resemble the object, then we ourselves have the power to create the idea which does resemble the object. The initial problem Malebranche sees with this theory is that ideas are spiritual in nature, and we are ascribing to ourselves the power of creating something spiritual out of nothing. Some people try to gloss over the issue by saying that it is not true creation since we are actually starting with something (i.e. the physical impressions of the object). Malebranche rejects such attempts to evade the real issue and he emphasizes all the more that this theory gives us the power to create something out of nothing. To illustrate his point, he argues that it is more difficult to create an angel out of stone than to create an angel from nothing. For, we can't make an angel from stone since they are of a different sort. Further, even if

we did have the power to create something from nothing, we still could not create an idea of an object. This would require some prior access to that object to accurately depict it. Malebranche continues that even if we did have the power to create something from nothing, we still could not create an idea of an object. This would require some prior access to that object to accurately depict it.

Malebranche considers a possible defense that we naturally have some kind of confused ideas of things, and it is from these confused ideas that we develop the more distinct ideas which more accurately resemble the original object. Thus, we do not actually create our accurate ideas, but merely develop them. He rejects this view, though, since the naturally implanted idea would have to be distinct, otherwise it would be useless in helping us form an accurate idea. And, if the naturally implanted idea was distinct, we would not need to develop another idea from it. Malebranche notes a second possible defense: we conceive of something, such as a square, through our pure intellect, and then develop a visual image of it through our imagination. Again Malebranche has problems with this view since the imagined image is not an exact copy of the first. He concludes this part of the discussion by noting why people erroneously believe that the human mind has the power to create ideas. First, people observe that when they will to think about a certain idea, such as the idea of an elephant, then the image of an elephant appears. Since the act of willing and the emergence of the idea are correlated, they erroneously assume that the will causes the idea. Logicians refer to this error as the fallacy of false cause. It is this tendency to ascribe false causes to things which results in superstitions.

The third explanation of the origin of ideas which Malebranche attacks is that all ideas of the external world were innately implanted in our minds when we were created by God, and we merely recall these ideas. He argues that this theory would require an infinite number ideas, each with an infinite number of variations. God would not adopt this approach if there is an easier way to accomplish the same task. A second problem with this theory concerns how the soul could decide to pick out a given idea to represent a given object when we look at it. Malebranche turns to the fourth explanation of the origin of ideas. On this view, the human soul is of such a superior nature, that it contains within itself the spiritual nature of external things themselves (which are inferior). Ideas of external things, then, are copies of the spiritual nature of those things as they exist within our own souls. Malebranche replies that the above theory can only apply to God insofar as God created the external world. As creator, God made the world based on a set of ideas he had of all the world's creatures and objects. These ideas are part of God's nature, and, thus, God sees within himself the existence and nature of all the things he created. By contrast, humans are limited, and we do not contain within ourselves the existence and nature of all things. He argues that our limited nature prevents us from having the existence and nature of all other things within ourselves. To illustrate our limitations, he examines the human conception of infinity and explains that we perceive infinity, but don't comprehend it. He argues further that the ideas we have of external things clearly depend on something other than ourselves. First, ideas of things do not depend on our wills. Second, when we have hallucinations, these don't even correspond to anything real.

SEEING ALL THINGS THROUGH GOD. Given the failure of the above four theories, Malebranche argues that we obtain ideas of external things by viewing them within God himself. For, God houses ideas of all external things, and, by his own choosing, allows us to see those ideas. This theory rests on the contention that spiritual entities reside in God. Malebranche maintains this for two reasons. First, as indicated above, as creator, God must have the ideas or blueprints of

all things. Second, all spirits (and spiritual things such as ideas) dwell within God, just as all physical things dwell in space. Malebranche offers several proofs of his theory that we get ideas of external objects by viewing those ideas in God. He still is troubled, though, by the second rejected theory above (that God innately planted ideas of external things in our minds) and he sees this as the principal rival to his own theory. His first defense of his own theory, then, is that it is a more efficient explanation than that offered by the rival theory. He rejects the theory of innately implanted ideas of external things because it is less efficient than Malebranche's own theory. He illustrates God's efficiency by describing the variety of things which God created out of extension alone (i.e. out of physical substance alone). Given that we obtain ideas of external things by viewing them through God, this does not mean that we actually can see the inner nature of God himself. God's nature is simple, and the ideas of things we see in God are complex.

A second argument for Malebranche's own theory is that it highlights God's sovereignty more than the alternative theory. His third argument is based on how we acquire abstract or general ideas, such as the universal notion of a triangle. General ideas are initially formed in God, and we access these through God. He argues that we cannot conceive of universal abstract ideas unless we saw all beings included in one, which we as humans cannot do on our own accord. Unlike humans, God can direct the mind in a wide range of different manners We, then, access these ideas through God. Using the abstract idea of "the infinite" as a starting point, Malebranche gives a variation of Descartes' proof of God's existence in Meditation 3. For Descartes, we have an innate idea of infinite perfection which must have been implanted in us by an infinitely perfect being (i.e., God). Malebranche's argument is as follows:

1. We have a concept of infinite being
2. We do not comprehend "infinite being" in the way in which ideas copy objects
3. Our comprehension of infinite being results from a union or direct acquaintance with God himself
4. Therefore, God exists

It is from the idea of infinite being, with which we are directly acquainted, that we form our ideas of finite beings. Specifically, we *reduce* our notion of infinite being to make it finite.

Malebranche turns to his final proof that we see all things in God. Since God creates all things for his own purpose, then as human creatures we cannot perceive anything without seeing God in those things. This is obviously that case when considering that all our love (or desire) is directed toward God. However, we see God especially when we consider necessary truths, such as those of mathematics and ethics. Malebranche cites Augustine who argues that we see God in the *ideas* behind truths. For Malebranche, though, we see God in the truths themselves. In addition to eternal truths, we also know all facts about the physical world by viewing them in God. When we see all things in God, though, it is not as if we ourselves are sensing them in God. Instead, God actively places these ideas in us by making the appropriate physiological modifications in our souls. God, thus, is the source of all ideas including facts about the physical world, necessary truths (such as 2+2=4), and moral truths (such as that we must love good). The manner in which God gives us these ideas, though, differs. Ideas of necessary truths, for example, come from a union or direct acquaintance with God himself.

Malebranche concludes that this is the most probable of all the theories of how we acquire ideas of objects. He also notes how it makes God actively involved in all causal relations which we are part of. He continues in Chapter Seven outlining the various ways we know things. We know God

through himself. We know bodies through the ideas which God gives us of them. We know our own souls through consciousness and inner sensation. Finally, we know other people's minds only through conjecture, based on their resemblance to ourselves.

OCCASIONALISM. Occasionalism is the view that God is the principal force behind all causal events. For example, when a baseball bat strikes a baseball, God is the actual cause of the motion of the baseball. The bat is merely the occasional or incidental cause which signals God to actually move the ball. Hints of this position are first found in Descartes' Principles on Philosophy 2:36. In defending the view that "God is the Primary Cause of Motion." Descartes argues as follows:

> **[The cause of motion in nature] is in fact twofold: first, there is the universal and primary cause -- the general cause of all the motions in the world. And second, there is the particular cause which produces in an individual piece of matter some motion which it previously lacked. Now as far as the general cause is concerned, it seems clear to me that this is no other than God himself. In the beginning in his omnipotence he created matter, along with its motion and rest. And now, merely by his regular concurrence, he preserves the same amount of motion and rest in the material universe as he put there in the beginning. ... Thus, God imparted various motions to the parts of matter when he first created them, and he now preserves all this matter in the same way, and by the same process by which he originally created it. And it follows from what we have said that this fact alone makes it most reasonable to think that God likewise always preserves the same quantity of motion in matter.**

Descartes' argument above is this:

1. **God first imparted things with motion at creation.**
2. **God preserves or maintains the existence of things after creation.**
3. **The act of preservation is indistinguishable from the act of creation (Meditation 3)**
4. **Thus, God continually imparts motion to things.**

What Descartes hinted at, his followers articulated more precisely. French historian and Cartesian philosopher Geraud de Cordemoy (d. 1684) drew a distinction between the "true cause" of an event, which is God, and its "occasional cause," such as the bat striking the ball. Malebranche further developed Cordemoy's reasoning and produced the definitive defense of the theory of occasionalism. His defense appears in the following selections from *The Search after Truth*, Book 6, part 2, chapter 3, titled, "Of the Most Dangerous Error in Philosophy; Of the Ancients."

Malebranche begins explaining how ancient philosophers postulated metaphysical entities as the basis of causal force. He refutes this position by pushing it to the point of absurdity. His first observation about their contention is that if something has causal power, it is to some degree divine. He continues his reduction to absurdity noting that anything with such power is superior to us and entitled to be worshipped. Following the logic of the ancient philosophers, then, it make some kind of sense to worship the sun as the sovereign divinity in view of the sun's causal power over nature. Having rejected the ancient conception of the source of causation, Malebranche argues that God is the true cause of all motion. His argument is as follows:

1. **Only physical bodies and spirits exist**
2. **Physical bodies cannot causally move things themselves**
3. **Therefore, only spirits can causally move things**

4. **Finite minds cannot causally move things**
5. **God, who is infinitely perfect, can causally move things.**
6. **Therefore, only God can causally move things**

Malebranche offers two arguments in defense of premise (d) above. First, we cannot be the cause of moving our arms (for example) since we do not understand how this is done. Second, it is incomprehensible that we should be the true cause of moving our arms since we see no necessary connection between our will and our movement. However, there is a necessary connection between God as cause, and such movement. For Malebranche, God's power *is* his will. God, then, is the true cause of all motion. The natural causes we see around us are what he calls occasional or incidental causes. Just as God is the true cause of all physical motion, Malebranche continues explaining that God is also the true cause of all mental events which are nonphysical. He argues specifically that God is the true cause of human sensation and bodily motion. Suppose, for example, I wish to move my arm. My task is to will this event. This becomes the cue for God to physically move my arm through physiological causes. For reasons of efficiency, God would not give us (or an angel) that kind of power to be the true cause since this would involve two wills: God's and the angels.

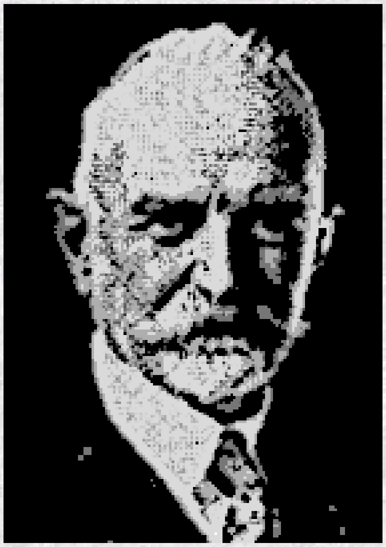
Malebranche offers additional arguments showing why God must be the true cause of bodily motion, even if our wills are involved too. First, if God would make someone move contrary to his desire, the person's desire would clearly be only the occasional cause, and not the true cause. Second, if God make a person's will the true cause of an event, then, in acts of creation and destruction, the person's will would be the true cause of this as well. This is especially absurd when considering non-human decisions in which the wills of animals and even the natural dispositions of matter may be present along with God's will. These, clearly, are not the true causes of the resulting motion, creation, or destruction. Third, if God could give such power to people, animals or matter, he would be making them into gods, which God cannot do. For Malebranche, superstitions and Godless beliefs resulted from the failure to recognize God as the true cause of all. Just as proper religion teaches us that there is only one true God, proper philosophy teaches us that there is only one true cause of everything.

REACTIONS TO MALEBRANCHE. During the modern period of philosophy, Malebranche's theory was examined both by Berkeley and Hume. Although they ultimately rejected Malebranche's views, they nevertheless used Malebranche's reasoning as a model for constructing their own arguments. In *Three Dialogues*, Berkeley considers Malebranche's view that we see all things through God and that that God is responsible for providing human souls with ideas. As Berkeley interprets Malebranche, our immaterial souls cannot directly encounter or perceive material things. God, though, is pure spirit and can encounter both the material and immaterial. Thus, we see all things through God. In the Dialogue Two, Philonous replies by using Ockham's razor: there is no real need for the external material world, hence the material world would be a useless creation. Philonous does recognize a similarity between Malebranche's view and Philonous's (i.e., Berkeley's) idealism: God feeds perceptions directly into the minds of the agent. However, Philonous notes several points of dissimilarity:

> **He builds on the most abstract general ideas, which I entirely disclaim. He asserts an absolute external world, which I deny. He maintains that we are deceived by our senses, and, know not the real natures or the true forms and figures of extended beings; of all which I hold the direct contrary. So that upon the whole there are no Principles more fundamentally opposite than his and mine.**

Later in Dialogue Two, Hylas considers Malebranche's theory that the presence of matter is the occasion at which God excites ideas in our minds. Philonous responds that God's power alone can account for these ideas without the crutch of material things.

Malebranche is also prominently discussed in Hume's groundbreaking chapter "Of the Idea of Necessary Connection" in the *Enquiry Concerning Human Understanding*. In that Chapter, Hume is on a quest for a reflective experience of a human mental operation which can serve as the foundation of an idea of causal power (i.e., necessary connection). He considers four possible candidates, two of which are relevant to Malebranche. The first is the hypothesis that we have an experience of control over the production of our thoughts. For example, if I wish to think about an idea of an elephant, then the image of an elephant appears in my mind. As seen above, Malebranche rejected the contention that we have such an ability without God's help. Hume, too, rejects this view for his own reasons. Nevertheless, by citing this hypothesis, it is evident that Hume used Malebranche's discussion above as a model for investigating the nature of causal power.



The other relevant hypothesis which Hume considers is Malebranche's occasionalism. Specifically, an occasionalist could claim that the idea of necessary connection is produced from the feeling we have when we experience God as the active force in all cause-effect relations. Hume explains that the motivation behind the occasionalist hypothesis was to preserve as much of God's power as possible. For Malebranche, then, God exemplifies greater power if he himself is the active force in all causal relations. Hume disagrees with Malebranche on this point: "It argues surely more power in the Deity to delegate a certain degree of power to inferior creatures than to produce everything by his own immediate volition."

George Herbert Mead (1863-1931)

George Herbert Mead is a major figure in the history of American philosophy, one of the founders of Pragmatism along with Peirce, James, Tufts, and Dewey. He published numerous papers during his lifetime and, following his death, several of his students produced four books in his name from Mead's unpublished (and even unfinished) notes and manuscripts, from students' notes, and from stenographic records of some of his courses at the University of Chicago. Through his teaching, writing, and posthumous publications, Mead has exercised a significant influence in 20th century social theory, among both philosophers and social scientists. In particular, Mead's theory of the emergence of mind and self out of the social process of significant communication has become the foundation of the symbolic interactionist school of sociology and social psychology. In addition to his well- known and widely appreciated social philosophy, Mead's thought includes significant contributions to the philosophy of nature, the philosophy of science, philosophical anthropology, the philosophy of history, and "process philosophy." Both John Dewey and Alfred North Whitehead considered Mead a thinker of the highest order.

Section Headings:

Life

George Herbert Mead was born in South Hadley, Massachusetts, on February 27, 1863, and he died in Chicago, Illinois, on April 26, 1931. He was the second child of Hiram Mead (d. 1881), a Congregationalist minister and pastor of the South Hadley Congregational Church, and Elizabeth Storrs Billings (1832-1917). George Herbert's older sister, Alice, was born in 1859. In 1870, the family moved to Oberlin, Ohio, where Hiram Mead became professor of homiletics at the Oberlin Theological Seminary, a position he held until his death in 1881. After her husband's death, Elizabeth Storrs Billings Mead taught for two years at Oberlin College and subsequently, from 1890 to 1900, served as president of Mount Holyoke College in South Hadley, Massachusetts.

George Herbert Mead entered Oberlin College in 1879 at the age of sixteen and graduated with a BA degree in 1883. While at Oberlin, Mead and his best friend, Henry Northrup Castle, became enthusiastic students of literature, poetry, and history, and staunch opponents of supernaturalism. In literature, Mead was especially interested in Wordsworth, Shelley, Carlyle, Shakespeare, Keats, and Milton; and in history, he concentrated on the writings of Macauley, Buckle, and Motley. Mead published an article on Charles Lamb in the 1882-3 issue of the *Oberlin Review* (15-16).

Upon graduating from Oberlin in 1883, Mead took a grade school teaching job, which, however, lasted only four months. Mead was let go because of the way in which he handled discipline problems: he would simply dismiss uninterested and disruptive students from his class and send them home.

From the end of 1883 through the summer of 1887, Mead was a surveyor with the Wisconsin Central Rail Road Company. He worked on the project that resulted in the eleven- hundred mile railroad line that ran from Minneapolis, Minnesota, to Moose Jaw, Saskatchewan, and which connected there with the Canadian Pacific railroad line.

Mead earned his MA degree in philosophy at Harvard University during the 1887-1888 academic year.

While majoring in philosophy, he also studied psychology, Greek, Latin, German, and French. Among his philosophy professors were George H. Palmer (1842-1933) and Josiah Royce (1855-1916). During this time, Mead was most influenced by Royce's Romanticism and idealism.

Since Mead was later to become one of the major figures in the American Pragmatist movement, it is interesting that, while at Harvard, he did not study under William James (1842-1910) (although he lived in James's home as tutor to the James children).

In the summer of 1888, Mead's friend, Henry Castle and his sister, Helen, had traveled to Europe and had settled temporarily in Leipzig, Germany. Later, in the early fall of 1888, Mead, too, went to Leipzig in order to pursue a Ph.D. degree in philosophy and physiological psychology. During the 1888-1889 academic year at the University of Leipzig, Mead became strongly interested in Darwinism and studied with Wilhelm Wundt (1832-1920) and G. Stanley Hall (1844-1924) (two major founders of experimental psychology). On Hall's recommendation, Mead transferred to the University of Berlin in the spring of 1889, where he concentrated on the study of physiological psychology and economic theory.

While Mead and his friends, the Castles, were staying in Leipzig, a romance between Mead and Helen Castle developed, and they were subsequently married in Berlin on October 1, 1891. Prior to George and Helen's marriage, Henry Castle had married Frieda Stechner of Leipzig, and Henry and his bride had returned to Cambridge, Massachusetts, where Henry continued his studies in law at Harvard.

Mead's work on his Ph.D. degree was interrupted in the spring of 1891 by the offer of an instructorship in philosophy and psychology at the University of Michigan. This was to replace James Hayden Tufts (1862-1942), who was leaving Michigan in order to complete his Ph.D. degree at the University of Freiburg. Mead took the job and never thereafter resumed his own Ph.D. studies

Mead worked at the University of Michigan from the fall of 1891 through the spring of 1894. He taught both philosophy and psychology. At Michigan, he became acquainted with and influenced by the work of sociologist Charles Horton Cooley (1864-1929), psychologist Alfred Lloyd, and philosopher John Dewey (1859-1952). Mead and Dewey became close personal and intellectual friends, finding much common ground in their interests in philosophy and psychology. In those days, the lines between philosophy and psychology were not sharply drawn, and Mead was to teach and do research in psychology throughout his career (mostly social psychology after 1910).

George and Helen Mead's only child, Henry Castle Albert Mead, was born in Ann Arbor in 1892. When the boy grew up, he became a physician and married Irene Tufts (James Hayden Tufts' daughter), a psychiatrist.

In 1892, having completed his Ph.D. work at Freiburg, James Hayden Tufts received an administrative appointment at the newly-created University of Chicago to help its founding president, William Rainey Harper, organize the new university (which opened in the fall of 1892). The University of Chicago was organized around three main departments: Semitics, chaired by J.M. Powis Smith; Classics, chaired by Paul Shorey; and Philosophy, chaired by John Dewey as of 1894. Dewey was recommended for that position by Tufts, and Dewey agreed to move from the University of Michigan to the University of Chicago provided that his friend and colleague, George Herbert Mead, was given a position as assistant professor in the Chicago philosophy department.

Thus, the University of Chicago became the new center of American Pragmatism (which had earlier originated with Charles Sanders Peirce [1839-1914] and William James at Harvard). The "Chicago

Pragmatists" were led by Tufts, Dewey, and Mead. Dewey left Chicago for Columbia University in 1904, leaving Tufts and Mead as the major spokesmen for the Pragmatist movement in Chicago.

Mead spent the rest of his life in Chicago. He was assistant professor of philosophy from 1894-1902; associate professor from 1902-1907; and full professor from 1907 until his death in 1931. During those years, Mead made substantial contributions in both social psychology and philosophy. Mead's major contribution to the field of social psychology was his attempt to show how the human self arises in the process of social interaction, especially by way of linguistic communication ("symbolic interaction"). In philosophy, as already mentioned, Mead was one of the major American Pragmatists. As such, he pursued and furthered the Pragmatist program and developed his own distinctive philosophical outlook centered around the concepts of sociality and temporality (see below).

Mrs. Helen Castle Mead died on December 25, 1929. George Mead was hit hard by her passing and gradually became ill himself. John Dewey arranged for Mead's appointment as a professor in the philosophy department at Columbia University as of the 1931-1932 academic year, but before he could take up that appointment, Mead died in Chicago on April 26, 1931.

Writings

During his more-than-40-year career, Mead thought deeply, wrote almost constantly, and published numerous articles and book reviews in philosophy and psychology. However, he never published a book. After his death, several of his students edited four volumes from stenographic records of his social psychology course at the University of Chicago, from Mead's lecture notes, and from Mead's numerous unpublished papers. The four books are *The Philosophy of the Present* (1932), edited by Arthur E. Murphy; *Mind, Self, and Society* (1934), edited by Charles W. Morris; *Movements of Thought in the Nineteenth Century* (1936), edited by Merritt H. Moore; and *The Philosophy of the Act* (1938), Mead's Carus Lectures of 1930, edited by Charles W. Morris.

Notable among Mead's published papers are the following: "Suggestions Towards a Theory of the Philosophical Disciplines" (1900); "Social Consciousness and the Consciousness of Meaning" (1910); "What Social Objects Must Psychology Presuppose" (1910); "The Mechanism of Social Consciousness" (1912); "The Social Self" (1913); "Scientific Method and the Individual Thinker" (1917); "A Behavioristic Account of the Significant Symbol" (1922); "The Genesis of Self and Social Control" (1925); "The Objective Reality of Perspectives" (1926);"The Nature of the Past" (1929); and "The Philosophies of Royce, James, and Dewey in Their American Setting" (1929). Twenty-five of Mead's most notable published articles have been collected in *Selected Writings: George Herbert Mead*, edited by Andrew J. Reck (Bobbs-Merrill, The Liberal Arts Press, 1964).

Most of Mead's writings and much of the secondary literature thereon are listed in the Bibliography, below.

Social Theory

Communication and Mind

In *Mind, Self and Society* (1934), Mead describes how the individual mind and self arises out of the social process. Instead of approaching human experience in terms of individual psychology, Mead analyzes experience from the "standpoint of communication as essential to the social order." Individual psychology, for Mead, is intelligible only in terms of social processes. The "development of the individual's self, and of his self- consciousness within the field of his experience" is preeminently social. For Mead, the social process is prior to the structures and processes of individual experience.

Mind, according to Mead, arises within the social process of communication and cannot be understood apart from that process. The communicational process involves two phases: (1) the "conversation of gestures" and (2) language, or the "conversation of significant gestures." Both phases presuppose a social context within which two or more individuals are in interaction with one another.

Mead introduces the idea of the "conversation of gestures" with his famous example of the dog-fight:

> Dogs approaching each other in hostile attitude carry on such a language of gestures. They walk around each other, growling and snapping, and waiting for the opportunity to attack . . . . (*Mind, Self and Society* 14) The act of each dog becomes the stimulus to the other dog for his response. There is then a relationship between these two; and as the act is responded to by the other dog, it, in turn, undergoes change. The very fact that the dog is ready to attack another becomes a stimulus to the other dog to change his own position or his own attitude. He has no sooner done this than the change of attitude in the second dog in turn causes the first dog to change his attitude. We have here a conversation of gestures. *They are not, however, gestures in the sense that they are significant*. We do not assume that the dog says to himself, "If the animal comes from this direction he is going to spring at my throat and I will turn in such a way." What does take place is an actual change in his own position due to the direction of the approach of the other dog. (*Mind, Self and Society* 42-43, emphasis added).

In the conversation of gestures, communication takes place without an awareness on the part of the individual of the response that her gesture elicits in others; and since the individual is unaware of the reactions of others to her gestures, she is unable to respond to her own gestures from the standpoint of others. The individual participant in the conversation of gestures is communicating, but she does not *know* that she is communicating. The conversation of gestures, that is, is *unconscious* communication.

It is, however, out of the conversation of gestures that language, or conscious communication, emerges. Mead's theory of communication is evolutionary: communication develops from more or less primitive toward more or less advanced forms of social interaction. In the human world, language supersedes (but does not abolish) the conversation of gestures and marks the transition from non-significant to significant interaction.

Language, in Mead's view, is communication through *significant symbols*. A significant symbol is a gesture (usually a vocal gesture) that calls out in the individual making the gesture the same (i.e., functionally identical) response that is called out in others to whom the gesture is directed (*Mind, Self*

and Society 47).

Significant communication may also be defined as the comprehension by the individual of the *meaning* of her gestures. Mead describes the communicational process as a social act since it necessarily requires at least two individuals in interaction with one another. It is within this act that meaning arises. The act of communication has a triadic structure consisting of the following components: (1) an initiating gesture on the part of an individual; (2) a response to that gesture by a second individual; and (3) the result of the action initiated by the first gesture (*Mind, Self and Society* 76, 81). There is no meaning independent of the interactive participation of two or more individuals in the act of communication.

Of course, the individual can anticipate the responses of others and can therefore consciously and intentionally make gestures that will bring out appropriate responses in others. This form of communication is quite different from that which takes place in the conversation of gestures, for in the latter there is no possibility of the conscious structuring and control of the communicational act.

Consciousness of meaning is that which permits the individual to respond to her own gestures as the other responds. A gesture, then, is an action that implies a *re*action. The reaction is the meaning of the gesture and points toward the result (the "intentionality") of the action initiated by the gesture. Gestures "become significant symbols when they implicitly arouse in an individual making them the same responses which they explicitly arouse, or are supposed [intended] to arouse, in other individuals, the individuals to whom they are addressed" (*Mind, Self and Society* 47). For example, "You ask somebody to bring a visitor a chair. You arouse the tendency to get the chair in the other, but if he is slow to act, you get the chair yourself. The response to the gesture is the doing of a certain thing, and you arouse that same tendency in yourself" (*Mind, Self and Society* 67). At this stage, the conversation of gestures is transformed into a conversation of significant symbols.

There is a certain ambiguity in Mead's use of the terms "meaning" and "significance." The question is, can a gesture be meaningful without being significant? But, if the meaning of a gesture is the response to that gesture, then there is meaning in the (non-significant) conversation of gestures -- the second dog, after all, responds to the gestures of the first dog in the dog- fight and vice-versa.

However, it is the conversation of *significant symbols* that is the foundation of Mead's theory of mind. "Only in terms of gestures as significant symbols is the existence of mind or intelligence possible; for only in terms of gestures which are significant symbols can thinking -- which is simply an internalized or implicit conversation of the individual with himself by means of such gestures -- take place" (*Mind, Self and Society* 47). Mind, then, is a form of participation in an interpersonal (i.e., social) process; it is the result of taking the attitudes of others toward one's own gestures (or conduct in general). Mind, in brief, is the use of significant symbols.

The essence of Mead's so-called "social behaviorism" is his view that mind is an emergent out of the interaction of organic individuals in a social matrix. Mind is not a substance located in some transcendent realm, nor is it merely a series of events that takes place within the human physiological structure. Mead therefore rejects the traditional view of the mind as a substance separate from the body as well as the behavioristic attempt to account for mind solely in terms of physiology or neurology. Mead agrees with the behaviorists that we can explain mind behaviorally if we deny its existence as a substantial entity and view it instead as a natural function of human organisms. But it is neither possible nor desirable to deny the existence of mind altogether. The physiological organism is a necessary but not sufficient condition of mental behavior (*Mind, Self and Society* 139). Without the peculiar character of the human central

nervous system, internalization by the individual of the process of significant communication would not be possible; but without the social process of conversational behavior, there would be no significant symbols for the individual to internalize.

The emergence of mind is contingent upon interaction between the human organism and its social environment; it is through participation in the social act of communication that the individual realizes her (physiological and neurological) potential for significantly symbolic behavior (i.e., thought). Mind, in Mead's terms, is the individualized focus of the communicational process -- it is *linguistic behavior* on the part of the individual. There is, then, no "mind or thought without language;" and language (the content of mind) "is only a development and product of social interaction" (*Mind, Self and Society* 191-192). Thus, mind is not reducible to the neurophysiology of the organic individual, but is an emergent in "the dynamic, ongoing social process" that constitutes human experience (*Mind, Self and Society* 7).

[Return to Section Headings]

Action

For Mead, mind arises out of the social act of communication. Mead's concept of the social act is relevant, not only to his theory of mind, but to all facets of his social philosophy. His theory of "mind, self, and society" is, in effect, a philosophy of the act from the standpoint of a social process involving the interaction of many individuals, just as his theory of knowledge and value is a philosophy of the act from the standpoint of the experiencing individual in interaction with an environment.

There are two models of the act in Mead's general philosophy: (1) the model of *the act-as-such*, i.e., organic activity in general (which is elaborated in *The Philosophy of the Act*), and (2) the model of *the social act*, i.e., social activity, which is a special case of organic activity and which is of particular (although not exclusive) relevance in the interpretation of human experience. The relation between the "social process of behavior" and the "social environment" is "analogous" to the relation between the "individual organism" and the "physical-biological environment" (*Mind, Self and Society* 130).

The Act-As-Such

In his analysis of the act-as-such (i.e., organic activity), Mead speaks of the act as *determining* "the relation between the individual and the environment" (*The Philosophy of the Act* 364). Reality, according to Mead, is a field of situations. "These situations are fundamentally characterized by the relation of an organic individual to his environment or world. The world, things, and the individual are what they are because of this relation [between the individual and his world]" (*The Philosophy of the Act* 215). It is by way of the act that the relation between the individual and his world is defined and developed.

Mead describes the act as developing in four stages: (1) the stage of *impulse*, upon which the organic individual responds to "problematic situations" in his experience (e.g., the intrusion of an enemy into the individual's field of existence); (2) the stage of *perception*, upon which the individual defines and analyzes his problem (e.g., the direction of the enemy's attack is sensed, and a path leading in the opposite direction is selected as an avenue of escape); (3) the stage of *manipulation*, upon which action is taken with reference to the individual's perceptual appraisal of the problematic situation (e.g., the individual runs off along the path and away from his enemy); and (4) the stage of *consummation*, upon which the encountered difficulty is resolved and the continuity of organic existence re- established (e.g., the individual escapes his enemy and returns to his ordinary affairs) (*The Philosophy of the Act* 3-25).]

What is of interest in this description is that the individual is not merely a passive recipient of external, environmental influences, but is capable of taking action with reference to such influences; he reconstructs his relation to his environment through selective perception and through the use or manipulation of the objects selected in perception (e.g., the path of escape mentioned above). The objects in the environment are, so to speak, created through the activity of the organic individual: the path along which the individual escapes was not "there" (in his thoughts or perceptions) until the individual needed a path of escape. Reality is not simply "out there," independent of the organic individual, but is the outcome of the dynamic interrelation of organism and environment. Perception, according to Mead, is a relation between organism and object. Perception is not, then, something that occurs *in* the organism, but is an objective relation between the organism and its environment; and the perceptual object is not an entity *out there*, independent of the organism, but is one pole of the interactive perceptual process (*The Philosophy of the Act* 81).

Objects of perception arise within the individual's attempt to solve problems that have emerged in his experience, problems that are, in an important sense, determined by the individual himself. The character of the individual's environment is predetermined by the individual's sensory capacities. The environment, then, is what it is in relation to a sensuous and selective organic individual; and things, or objects, "are what they are in the relationship between the individual and his environment, and this relationship is that of conduct [i.e., action]" (*The Philosophy of the Act* 218).

The Social Act

While the social act is analogous to the act-as-such, the above-described model of "individual biological activity" (*Mind, Self and Society* 130) will not suffice as an analysis of social experience. The "social organism" is not an organic individual, but "a social group of individual organisms" (*Mind, Self and Society* 130). The human individual, then, is a member of a social organism, and his acts must be viewed in the context of social acts that involve other individuals. Society is not a collection of preexisting atomic individuals (as suggested, for example, by Hobbes, Locke, and Rousseau), but rather a processual whole within which individuals define themselves through participation in social acts. The acts of the individual are, according to Mead, aspects of acts that are trans- individual. "For social psychology, the whole (society) is prior to the part (the individual), not the part to the whole; and the part is explained in terms of the whole, not the whole in terms of the part or parts" (*Mind, Self and Society* 7). Thus, the social act is a "dynamic whole," a "complex organic process," within which the individual is situated, and it is within this situation that individual acts are possible and have meaning.

Mead defines the *social act* in relation to the *social object*. The social act is a collective act involving the participation of two or more individuals; and the social object is a collective object having a common meaning for each participant in the act. There are many kinds of social acts, some very simple, some very complex. These range from the (relatively) simple interaction of two individuals (e.g., in dancing, in love-making, or in a game of handball), to rather more complex acts involving more than two individuals (e.g., a play, a religious ritual, a hunting expedition), to still more complex acts carried on in the form of social organizations and institutions (e.g., law- enforcement, education, economic exchange). The life of a society consists in the aggregate of such social acts.

It is by way of the social act that persons in society create their reality. The objects of the social world (common objects such as clothes, furniture, tools, as well as scientific objects such as atoms and electrons) are what they are as a result of being defined and utilized within the matrix of specific social

acts. Thus, an animal skin becomes a coat in the experience of people (e.g., barbarians or pretenders to aristocracy) engaged in the social act of covering and/or adorning their bodies; and the electron is introduced (as a hypothetical object) in the scientific community's project of investigating the ultimate nature of physical reality.

Communication through significant symbols is that which renders the intelligent organization of social acts possible. Significant communication, as stated earlier, involves the comprehension of meaning, i.e., the taking of the attitude of others toward one's own gestures. Significant communication among individuals creates a world of common (symbolic) meanings within which further and deliberate social acts are possible. The specifically human social act, in other words, is rooted in the act of significant communication and is, in fact, ordered by the conversation of significant symbols.

In addition to its role in the organization of the social act, significant communication is also fundamentally involved in the creation of social objects. For it is by way of significant symbols that humans indicate to one another the object relevant to their collective acts. For example, suppose that a group of people has decided on a trip to the zoo. One of the group offers to drive the others in his car; and the others respond by following the driver to his vehicle. The car has thus become an object for all members of the group, and they all make use of it to get to the zoo. Prior to this particular project of going to the zoo, the car did not have the specific significance that it takes on in becoming instrumental in the zoo-trip. The car was, no doubt, an object in some other social act prior to its incorporation into the zoo-trip; but prior to that incorporation, it was not specifically and explicitly a means of transportation to the zoo. Whatever it was, however, would be determined by its role in some social act (e.g., the owner's project of getting to work each day, etc.). It is perhaps needless to point out that the decision to go to the zoo, as well as the decision to use the car in question as a means of transportation, was made through a conversation involving significant symbols. The significant symbol functions here to indicate "some object or other within the field of social behavior, an object of common interest to all the individuals involved in the given social act thus directed toward or upon that object" (*Mind, Self and Society* 46). The reality that humans experience is, for Mead, very largely socially constructed in a process mediated and facilitated by the use of significant symbols.

[Return to Section Headings]

Self and Other

The Self as Social Emergent

The self, like the mind, is a social emergent. This social conception of the self, Mead argues, entails that individual selves are the products of social interaction and not the (logical or biological) preconditions of that interaction. Mead contrasts his social theory of the self with individualistic theories of the self (i.e., theories that presuppose the priority of selves to social process). "The self is something which has a development; it is not initially there, at birth, but arises in the process of social experience and activity, that is, develops in the given individual as a result of his relations to that process as a whole and to other individuals within that process" (*Mind, Self and Society* 135). Mead's model of society is an organic model in which individuals are related to the social process as bodily parts are related to bodies.

The self is a reflective process -- i.e., "it is an object to itself." For Mead, it is the reflexivity of the self that "distinguishes it from other objects and from the body." For the body and other objects are not objects to themselves as the self is.

> It is perfectly true that the eye can see the foot, but it does not see the body as a whole. We cannot see our backs; we can feel certain portions of them, if we are agile, but we cannot get an experience of our whole body. There are, of course, experiences which are somewhat vague and difficult of location, but the bodily experiences are for us organized about a self. The foot and hand belong to the self. We can see our feet, especially if we look at them from the wrong end of an opera glass, as strange things which we have difficulty in recognizing as our own. The parts of the body are quite distinguishable from the self. We can lose parts of the body without any serious invasion of the self. The mere ability to experience different parts of the body is not different from the experience of a table. The table presents a different feel from what the hand does when one hand feels another, but it is an experience of something with which we come definitely into contact. The body does not experience itself as a whole, in the sense in which the self in some way enters into the experience of the self (*Mind, Self and Society* 136).

It is, moreover, this reflexivity of the self that distinguishes human from animal consciousness (*Mind, Self and Society*, fn., 137). Mead points out two uses of the term "consciousness": (1) "consciousness" may denote "a certain feeling consciousness" which is the outcome of an organism's sensitivity to its environment (in this sense, animals, in so far as they act with reference to events in their environments, are conscious); and (2) "consciousness" may refer to a form of awareness "which always has, implicitly at least, the reference to an 'I' in it" (i.e., the term "consciousness" may mean *self*- consciousness) (*Mind, Self and Society* 165). It is the second use of the term "consciousness" that is appropriate to the discussion of human consciousness. While there is a form of pre-reflective consciousness that refers to the "bare thereness of the world," it is reflective (or self-) consciousness that characterizes human awareness. The pre-reflective world is a world in which the self is absent (*Mind, Self and Society* 135-136).

Self-consciousness, then, involves the objectification of the self. In the mode of self- consciousness, the "individual enters as such into his own experience . . . as an object" (*Mind, Self and Society* 225). *How is this objectification of the self possible?* The individual, according to Mead, "can enter as an object [to himself] only on the basis of social relations and interactions, only by means of his experiential transactions with other individuals in an organized social environment" (*Mind, Self and Society* 225). Self-consciousness is the result of a process in which the individual takes the attitudes of others toward herself, in which she attempts to view herself from the standpoint of others. The self-as-object arises out of the individual's experience of other selves outside of herself. The objectified self is an emergent within the social structures and processes of human intersubjectivity.

Symbolic Interaction and the Emergence of the Self

Mead's account of the social emergence of the self is developed further through an elucidation of three forms of inter-subjective activity: *language*, *play*, and *the game*. These forms of "symbolic interaction" (i.e., social interactions that take place via shared symbols such as words, definitions, roles, gestures, rituals, etc.) are the major paradigms in Mead's theory of socialization and are the basic social processes that render the reflexive objectification of the self possible.

Language, as we have seen, is communication via "significant symbols," and it is through significant communication that the individual is able to take the attitudes of others toward herself. Language is not

only a "necessary mechanism" of mind, but also the primary social foundation of the self:

> I know of no other form of behavior than the linguistic in which the individual is an object to himself . . . (*Mind, Self and Society* 142). When a self does appear it always involves an experience of another; there could not be an experience of a self simply by itself. The plant or the lower animal reacts to its environment, but there is no experience of a self . . . . When the response of the other becomes an essential part in the experience or conduct of the individual; when taking the attitude of the other becomes an essential part in his behavior -- then the individual appears in his own experience as a self; and until this happens he does not appear as a self (*Mind, Self and Society* 195).

Within the linguistic act, the individual takes the role of the other, i.e., responds to her own gestures in terms of the symbolized attitudes of others. This "process of taking the role of the other" within the process of symbolic interaction is the primal form of self-objectification and is essential to self-realization (*Mind, Self and Society* 160-161).

It ought to be clear, then, that the self-as-object of which Mead speaks is not an object in a mechanistic, billiard ball world of external relations, but rather it is a basic structure of human experience that arises in response to other persons in an organic social-symbolic world of internal (and inter- subjective) relations. This becomes even clearer in Mead's interpretation of playing and gaming. In playing and gaming, as in linguistic activity, the key to the generation of self-consciousness is the process of role-playing." In play, the child takes the role of another and acts *as though* she *were* the other (e.g., mother, doctor, nurse, Indian, and countless other symbolized roles). This form of role-playing involves a single role at a time. Thus, the other which comes into the child's experience in play is a "specific other" (*The Philosophy of the Present* 169).

The game involves a more complex form of role-playing than that involved in play. In the game, the individual is required to internalize, not merely the character of a single and specific other, but the roles of *all* others who are involved with him in the game. He must, moreover, comprehend the rules of the game which condition the various roles (*Mind, Self and Society* 151). This configuration of roles-organized-according-to- rules brings the attitudes of all participants together to form a symbolized unity: this unity is the "generalized other" (*Mind, Self and Society* 154). The generalized other is "an organized and generalized attitude" (*Mind, Self and Society* 195) with reference to which the individual defines her own conduct. When the individual can view herself from the standpoint of the generalized other, "self- consciousness in the full sense of the term" is attained.

The game, then, is the stage of the social process at which the individual attains selfhood. One of Mead's most outstanding contributions to the development of critical social theory is his analysis of games. Mead elucidates the full social and psychological significance of game-playing and the extent to which the game functions as an instrument of social control. The following passage contains a remarkable piece of analysis:

> What goes on in the game goes on in the life of the child all the time. He is continually taking the attitudes of those about him, especially the roles of those who in some sense control him and on whom he depends. He gets the function of the process in an abstract way at first. It goes over from the play into the game in a real sense. *He has to play the game*. The morale of the game takes hold of the child more than the larger morale of the whole community. The child passes into the game and the game expresses a social situation in

> which he can completely enter; *its morale may have a greater hold on him than that of the family to which he belongs or the community in which he lives*. There are all sorts of social organizations, some of which are fairly lasting, some temporary, into which the child is entering, *and he is playing a sort of social game in them*. It is a period in which he likes "to belong," and he gets into organizations which come into existence and pass out of existence. *He becomes a something which can function in the organized whole*, and thus tends to determine himself in his relationship with the group to which he belongs. That process is one which is a striking stage in the development of the child's morale. It constitutes him a self-conscious member of the community to which he belongs (*Mind, Self and Society* 160, emphasis added).

The "Me" and the "I"

Although the self is a product of socio-symbolic interaction, it is not merely a passive reflection of the generalized other. The individual's response to the social world is active; she *decides* what she will do *in the light of* the attitudes of others; but her conduct is not mechanically determined by such attitudinal structures. There are, it would appear, two phases (or poles) of the self: (1) that phase which reflects the attitude of the generalized other and (2) that phase which *responds to* the attitude of the generalized other. Here, Mead distinguishes between the "me" and the "I." The "me" is the social self, and the "I" is a response to the "me" (*Mind, Self and Society* 178). "The 'I' is the response of the organism to the attitudes of the others; the 'me' is the organized set of attitudes of others which one himself assumes" (*Mind, Self and Society* 175). Mead defines the "me" as "a conventional, habitual individual," and the "I" as the "novel reply" of the individual to the generalized other (*Mind, Self and Society* 197). There is a dialectical relationship between society and the individual; and this dialectic is enacted on the intra-psychic level in terms of the polarity of the "me" and the "I." The "me" is the internalization of roles which derive from such symbolic processes as linguistic interaction, playing, and gaming; whereas the "I" is a "creative response" to the symbolized structures of the "me" (i.e., to the generalized other).

Although the "I" is not an object of immediate experience, it is, in a sense, knowable (i.e., objectifiable). The "I" is apprehended in memory; but in the memory image, the "I" is no longer a pure subject, but "a subject that is now an object of observation" (*Selected Writings* 142). We can understand the structural and functional significance of the "I," but we cannot observe it directly -- it appears only *ex post facto*. We *remember* the responses of the "I" to the "me;" and this is as close as we can get to a concrete knowledge of the "I." The objectification of the "I" is possible only through an awareness of the past; but the objectified "I" is never the subject of present experience. "If you ask, then, where directly in your own experience the 'I' comes in, the answer is that it comes in as a historical figure" (*Mind, Self and Society* 174).

The "I" appears as a symbolized object in our consciousness of our past actions, but then it has become part of the "me." The "me" is, in a sense, that phase of the self that represents the past (i.e., the already-established generalized other). The "I," which is a response to the "me," represents action in a present (i.e., "that which is actually going on, taking place") and implies the restructuring of the "me" in a future. After the "I" has acted, "we can catch it in our memory and place it in terms of that which we have done," but it is now (in the newly emerged present) an aspect of the restructured "me" (*Mind, Self and Society* 204, 203).

Because of the temporal-historical dimension of the self, the character of the "I" is determinable only *after* it has occurred; the "I" is not, therefore, subject to predetermination. Particular acts of the "I" become aspects of the "me" in the sense that they are objectified through memory; but the "I" as such is not contained in the "me."

The human individual exists in a social situation and responds to that situation. The situation has a particular character, but this character does not completely determine the response of the individual; there seem to be alternative courses of action. The individual must select a course of action (and even a decision to do "nothing" is a response to the situation) and act accordingly, but the course of action she selects is not dictated by the situation. It is this indeterminacy of response that "gives the sense of freedom, of initiative" (*Mind, Self and Society* 177). The action of the "I" is revealed only in the action itself; specific prediction of the action of the "I" is not possible. The individual is determined to respond, but the specific character of her response is not fully determined. The individual's responses are *conditioned*, but not determined by the situation in which she acts (*Mind, Self and Society* 210-211). Human freedom is conditioned freedom.

Thus, the "I" and the "me" exist in dynamic relation to one another. The human personality (or self) arises in a social situation. This situation structures the "me" by means of inter-subjective symbolic processes (language, gestures, play, games, etc.), and the active organism, as it continues to develop, must respond to its situation and to its "me." This response of the active organism is the "I."

The individual takes the attitude of the "me" or the attitude of the "I" according to situations in which she finds herself. For Mead, "both aspects of the 'I' and the 'me' are essential to the self in its full expression" (*Mind, Self and Society* 199). Both community and individual autonomy are necessary to identity. The "I" is process breaking through structure. The "me" is a necessary symbolic structure which renders the action of the "I" possible, and "without this structure of things, the life of the self would become impossible" (*Mind, Self and Society* 214).

The Dialectic of Self and Other

The self arises when the individual takes the attitude of the generalized other toward herself. This "internalization" of the generalized other occurs through the individual's participation in the conversation of significant symbols (i.e., language) and in other socialization processes (e.g., play and games). The self, then, is of great value to organized society: the internalization of the conversation of significant symbols and of other interactional symbolic structures allows for "the superior co-ordination" of "society as a whole," and for the "increased efficiency of the individual as a member of the group" (*Mind, Self and Society* 179). The generalized other (internalized in the "me") is a major instrument of social control; it is the mechanism by which the community gains control "over the conduct of its individual members" (*Mind, Self and Society* 155)."Social control," in Mead's words, "is the expression of the 'me' over against the expression of the 'I'" (*Mind, Self and Society* 210).

The genesis of the self in social process is thus a condition of social control. The self is a social emergent that supports the cohesion of the group; individual will is harmonized, by means of a socially defined and symbolized "reality," with social goals and values. "In so far as there are social acts," writes Mead, "there are social objects, and I take it that social control is bringing the act of the individual into relation with this social object" (*The Philosophy of the Act* 191). Thus, there are two dimensions of Mead's theory of

internalization: (1) the internalization of the attitudes of others toward oneself and toward one another (i.e., internalization of the interpersonal process); and (2) the internalization of the attitudes of others "toward the various phases or aspects of the common social activity or set of social undertakings in which, as members of an organized society or social group, they are all engaged" (*Mind, Self and Society* 154-155).

The self, then, has reference, not only to others, but to social projects and goals, and it is by means of the socialization process (i.e., the internalization of the generalized other through language, play, and the game) that the individual is brought to "assume the attitudes of those in the group who are involved with him in his social activities" (*The Philosophy of the Act* 192). By learning to speak, gesture, and play in "appropriate" ways, the individual is brought into line with the accepted symbolized roles and rules of the social process. The self is therefore one of the most subtle and effective instruments of social control.

For Mead, however, social control has its limits. One of these limits is the phenomenon of the "I," as described in the preceding section. Another limit to social control is presented in Mead's description of specific social relations. This description has important consequences regarding the way in which the concept of the generalized other is to be applied in social analysis.

The self emerges out of "a special set of social relations with all the other individuals" involved in a given set of social projects (*Mind, Self and Society* 156-157). The self is always a reflection of specific social relations that are themselves founded on the specific mode of activity of the group in question. The concept of property, for example, presupposes a community with certain kinds of responses; the idea of property has specific social and historical foundations and symbolizes the interests and values of specific social groups.

Mead delineates two types of social groups in civilized communities. There are, on the one hand, "concrete social classes or subgroups" in which "individual members are directly related to one another." On the other hand, there are "abstract social classes or subgroups" in which "individual members are related to one another only more or less indirectly, and which only more or less indirectly function as social units, but which afford unlimited possibilities for the widening and ramifying and enriching of the social relations among all the individual members of the given society as an organized and unified whole" (*Mind, Self and Society* 157). Such abstract social groups provide the opportunity for a radical extension of the "definite social relations" which constitute the individual's sense of self and which structure her conduct.

Human society, then, contains a multiplicity of generalized others. The individual is capable of holding membership in different groups, both simultaneously and serially, and may therefore relate herself to different generalized others at different times; or she may extend her conception of the generalized other by identifying herself with a "larger" community than the one in which she has hitherto been involved (e.g., she may come to view herself as a member of a nation rather than as a member of a tribe). The self is not confined within the limits of any one generalized other. It is true that the self arises through the internalization of the generalized attitudes of others, but there is, it would appear, no absolute limit to the individual's capacity to encompass new others within the dynamic structure of the self. This makes strict and total social control difficult if not impossible.

Mead's description of social relations also has interesting implications vis- a-vis the sociological problem of the relation between consensus and conflict in society. It is clear that both consensus and conflict are significant dimensions of social process; and in Mead's view, the problem is not to decide *either* for a

consensus model of society *or* for a conflict model, but to describe as directly as possible the function of both consensus and conflict in human social life.

There are two models of consensus-conflict relation in Mead's analysis of social relations. These may be schematized as follows:

1. Intra-Group Consensus -- Extra-Group Conflict
2. Intra-Group Conflict -- Extra-Group Consensus

In the first model, the members of a given group are united in opposition to another group which is characterized as the "common enemy" of all members of the first group. Mead points out that the idea of a common enemy is central in much of human social organization and that it is frequently the major reference-point of intra-group consensus. For example, a great many human organizations derive their *raison d'etre* and their sense of solidarity from the existence (or putative existence) of the "enemy" (communists, atheists, infidels, fascist pigs, religious "fanatics," liberals, conservatives, or whatever). The generalized other of such an organization is formed in opposition to the generalized other of the enemy. The individual is "with" the members of her group and "against" members of the enemy group.

Mead's second model, that of intra-group conflict and extra-group consensus, is employed in his description of the process in which the individual reacts *against* her own group. The individual opposes her group by appealing to a "higher sort of community" that she holds to be superior to her own. She may do this by appealing to the past (e.g., she may ground her criticism of the bureaucratic state in a conception of "Jeffersonian Democracy"), or by appealing to the future (e.g., she may point to the ideal of "all mankind," of the universal community, an ideal that has the future as its ever-receding reference point). Thus, intra-group conflict is carried on in terms of an extra-group consensus, even if the consensus is merely assumed or posited. This model presupposes Mead's conception of the multiplicity of generalized others, i.e., the field within which conflicts are possible. It is also true that the individual can criticize her group only in so far as she can symbolize to herself the generalized other of that group; otherwise she would have nothing to criticize, nor would she have the motivation to do so. It is in this sense that social criticism presupposes social- symbolic process and a social self capable of symbolic reflexive activity.

In addition to the above-described models of consensus-conflict relation, Mead also points out an explicitly temporal interaction between consensus and conflict. Human conflicts often lead to resolutions that create new forms of consensus. Thus, when such conflicts occur, they can lead to whole "reconstructions of the particular social situations" that are the contexts of the conflicts (e.g., a war between two nations may be followed by new political alignments in which the two warring nations become allies). Such reconstructions of society are effected by the minds of individuals in conflict and constitute enlargements of the social whole.

An interesting consequence of Mead's analysis of social conflict is that the reconstruction of society will entail the reconstruction of the self. This aspect of the social dynamic is particularly clear in terms of Mead's concept of intra-group conflict and his description of the dialectic of the "me" and the "I." As pointed out earlier, the "I" is an emergent response to the generalized other; and the "me" is that phase of the self that represents the social situation within which the individual must operate. Thus, the critical capacity of the self takes form in the "I" and has two dimensions: (1) explicit self- criticism (aimed at the "me") is implicit social criticism; and (2) explicit social criticism is implicit self- criticism. For example, the criticism of one's own moral principles is also the criticism of the morality of one's social world, for

personal morality is rooted in social morality. Conversely, the criticism of the morality of one's society raises questions concerning one's own moral role in the social situation.
